Mr. SHAW-LEFEVRE says a wise thing when he announces that he loves and admires London, and, indeed, never feels quite happy when out of it. There is a popular affectation which is always expressing itself in contempt of London. It is a fine thing to be glad to get out of it, away from its fogs and mud, "anywhere, anywhere out of the world" that one has to live in. It is the very same sort of fine thing to try to live up to some one else's century instead of one's own nineteenth. It is the same thing again to strive after an ideal life, as so many do, or pretend to do, hating the substantial flesh with such a cold, dull hatred, and loving the ethereal spirit with such a warm and pungent love. The true regulation hatred of London is singularly uncompromising and unreserved; people of the right sort hate its streets and squares, its centre and suburbs, its houses outside and its houses inside and its public statues more than anything else—except its public buildings, which are shocking. Even Mr. SHAW-LEFEVRE betrays unconsciously the fact that his love of London is not wholly free from this habit of superficial cynicism. "He did not know," says one of the newspaper reports, "whether the work of modern times was so good or excellent that one would feel inclined to do much in the way of additions, but at all events one could do but little harm in the way of destruction." We prefer to suppose here, either that the speaker did not think what he was saying, or that his oratory got a little confused in the way that confuses even the best of reporters; but if so liberal-minded a representative of the Government, now that we have at last got him, is really inclined to give way so far, in spite of all other liberality of feeling, as to entertain the absurd idea that the modern artistic work of London is wholly bad, we beg to ask him to reflect for a moment. There is absolutely no branch of discovery or invention, of knowledge or of skill, in which Englishmen of the present very remarkable age are not acknowledged by the best foreign opinion to be able to place themselves in the very foremost rank of merit; and architecture is certainly one department in which, beyond all dispute, Englishmen, during the last fifty years, under conditions frequently most unfavourable, have done their duty to the utmost. It is not enough to express a vague admiration for the Tower and St. Paul's, the Abbey and Westminster Hall. BARRY'S Palace of the Legislature is the admiration of the world. The Bank of England, Somerset House, the British Museum, University College, the National Gallery itself, the club-houses, and hundreds of municipal, ecclesiastical, and domestic buildings all over the town, can hold their own, in one respect or another, in comparison with the corresponding edifices of any other capital whatever; while the new churches of England, London included, taken as a whole and from their own point of view, constitute perhaps the most excellent development of building art in all history, having regard to the short period of time which has created them, and the peculiar characteristics of national temperament which they represent. "If it be true," said Mr. LEFEVRE again (as suggested by the lecturer of the evening, Mr. HARRISON), "that Londoners feel a sense of weariness and gloom when they regard London, it is because they do not know London, and will not raise their eyes to see what is daily before them." "London," he added, "as a whole, is one of the most beautiful cities, if not the most beautiful, in Europe." Here he speaks (to use a very common but significant phrase) as a sensible man. He is not alone in his opinion, either at home or abroad. London has many faults, but so have other towns wherever they may be; and we do not hesitate to say that if the Legislature, in some particularly lucid interval, were to happen to give Mr. SHAW-LEFEVRE what is called a little latitude, there are many of the faults of London which, under good advice, he might soon see his way to remove without so much trouble as might be expected.

One practical reflection in which we may take leave to indulge is that it might be well for the Government to consider, in their new municipal projects for the metropolis, whether the time has not arrived for the institution of a Ministry of Metropolitan Building. That the structural prementment of the capital city of a great empire is a subject of serious national importance is a principle which ought by this time to be publicly recognised in England as it is elsewhere. Especially when it is becoming a life-struggle with us to compete with other nations in the arts of industrial taste ought this to be taken into grave consideration. It is not that we

need showy buildings and costly ornamentation ; but the calm utilitarian repose of stately grace must not be disregarded as it has been. If anything is to be done in this direction, it will never be by the action of local "ratepayers," but by the generous forces of national enterprise. London is not the mere town of the Londoners ; it is the heart and soul of England, and the joy of all English-speaking peoples, and it ought to be so cherished. To speak perhaps a little too plainly, let us say that, without wishing to see a Mr. SHAW-LEFEVRE taking the place of the Lord Mayor, we should be glad to see him charged with the administration of the architectural and artistic improvement of the metropolis, in the proper interest of the nation at large.

## THE ASSESSOR AND PUBLIC COMPETITIONS.

OUR readers will remember, that in May 1880 the late Mr. STREET presented a memorial to the President and Council of the Royal Institute of British Architects on the subject of public architectural competitions. This memorial was signed by some fourteen hundred architects, and excited a good deal of attention at the time, besides, in our opinion, affecting a large measure of reform. The words of the memorial ran thus :—

We, the undersigned Fellows and Associates of the Royal Institute of British Architects, being fully convinced of the unsatisfactory state of public architectural competitions as at present conducted, beg respectfully to bring the subject before the Council of the Institute for consideration.

Your memorialists are of opinion that this question can most successfully be dealt with in the interest of the whole profession by the Institute, as representing so large a section of it, and they earnestly hope that the Council will be able to devise a remedy which, while insuring greater advantages to the public, will at the same time place the competition system on a more satisfactory basis.

Your memorialists are further of opinion that the necessities of the case call for united action on the part of the profession, and that the most effectual way of insuring this will be to devise some scheme whereby all members of the profession can agree not to take part in any public competition unless a professional adjudicator of established reputation is appointed, and to such a condition, if generally accepted, your memorialists are prepared to bind themselves.

And we, the undersigned architects, not being members of the above Society, are desirous to aid this reform in public competitions as set forth in the memorial, and we are willing to bind ourselves under a similar condition if generally accepted.

Since then a committee was appointed, on the nomination of Mr. PORTER, to go into the whole question of competitions. The result of their labours was the issue of a paper entitled, "Suggestions for the conduct of Architectural Competitions," which was adopted at a special meeting of the Institute, in place of the old set of rules hitherto in use. At the conclusion of the labours of this committee, a second one was appointed, whose particular business was to be the carrying out of the objects of the memorial presented by the late Mr. STREET. We publish in another part of our paper a copy of a circular and form attached, which has been sent to every architect practising in the United Kingdom.

Of the justice of the principle the advocates of this movement contend for we think there can be no doubt, namely, the professional assessor for all public architectural competitions ; and we venture to hope that every architect who has the interests of the profession at heart will join in procuring this measure of justice from the promoters of competitions. We are not sanguine enough to suppose that, an era of universal contentment will set in, and that from henceforth all jealousies will cease to exist, and impartial justice be administered ; but that such a scheme as is now before us, if generally supported, will conduce to a better selection of designs and to greater fairness to competitors we firmly believe. Let promoters once grasp the fact that architects will not send them in designs unless they guarantee that their labours shall be judged by competent men, thoroughly acquainted with the principles of design and practice, and they will not be slow to comply with so very modest a request. To grant it is to their own benefit, removing from themselves the slur—so often cast—of using favouritism, and also lessening considerably their responsibilities. It requires the nicest discrimination and the clearest judgment in deciding upon the rival merits of design, and appreciating

the niceties of plan and general arrangement. How can laymen decide with little or no experience to guide them ? The task of selection at best is not an easy one to carry out, and the argument is a sound one, that a specialist by lifelong study should be better able to say what is good, bad, or indifferent in the designs submitted, than a committee of laymen. Every one knows that many architects submit designs which are too often selected, because the drawings are got up for show and to take the eye, regardless of the amount to be spent ; laymen cannot decide upon such points, and so too often a modest design, honestly carrying out the instructions, is set on one side and a vulgar one chosen in its stead. Then comes the question of builders' estimates, often and often largely in excess of the advertised conditions ; then cutting down of essentials to maintain outside appearances, and universal recriminations on all sides. Now much of this might be spared, and the public would be the gainers, as well as all those architects who desire to act honourably and fairly.

The objection that some architects will feel to sign any such undertaking as we have now before us, is that by so doing they would be tying their own hands, and playing into those of men who do not sign, and who will be only too glad to stand on one side and see formidable rivals muzzled, while they were free to step in and compete with more chances of winning the prizes offered. Such an objection is a perfectly fair one to take, but it is one that the advocates of the movement have frequently heard. They urge, in reply, that to accomplish any useful reform some sacrifice is demanded ; that the number who signed the memorial, and the well-known names of so many of them, was sufficient proof of the interest felt in the question, and that it is a fair presumption that the memorialists, who are in honour bound now to fulfil their pledge, will be very largely supported by others, who before waited to see what results would follow, and that the list, when completed, will embrace all the best-known men in the profession. The Committee state in their circular, that part of their duty will be to acquaint promoters of competitions with the undertaking that has been entered into, and to forward a list of those supporting it. They consider that the effect of this will be that the promoters, looking down the long list of names, and seeing in it all or most of those who have distinguished themselves in the profession, and pledged to the condition named, will hesitate before they invite a competition among those who are not on the list—would recognise the force of circumstances and the justice of the position taken up by the signers. Granted that in a few cases promoters paid no regard to this protest, designs would of course be sent in, but the class of men who would compete would be hardly those a responsible committee would care to employ, and precisely the class of men who would be likely to submit designs that an assessor would reject.

In other words, we think no architect, competent in his work, upright, and desirous of seeing justice done to his fellows as well as to himself, will hesitate to throw in his lot with the memorialists. If a man is *not* competent, upright, and desirous of seeing justice done, he may be left alone ; his employment on any work is likely to do more in support of the professional assessor than perhaps his adhesion to the pledge.

If the profession will only recognise the importance of their position before the public, and combine to maintain it by all lawful and fair means, they have the solution of the whole problem in their hands, and by putting aside petty jealousies, by showing a bold front, and taking what little risk there is, a reform will be gained beneficial to all concerned.

On another occasion we shall state our views on the selection of the professional assessor and his duties.

## A JAPANESE WAREHOUSE.

THE amalgamation of city churches is no new experiment. Over three centuries ago it was tried in London, and in consequence St. Mary Axe, as a separate parish, ceased to exist. That good old chronicler, of whom London should be proud, the tailor JOHN STOW, described, for the enlightenment of his fellow citizens, how the change came about. "In St. Marie Street," he said, "ye had of old time a parish church, of St. Marie the Virgin, St. Ursula, and the Eleven Thousand Virgins, which church was commonly called St. Marie at the

Axe, of the sign of an axe, over against the east end thereof, or St. Marie Pellipar, of a plot of a ground on the north side thereof pertaining to the Skinners in London. This parish, about the year 1565, was united to the parish church of St. Andrew Undershaft, and so was St. Marie at the Axe suppressed and letten out to be a warehouse for a merchant." From that time the merchants have not lost their hold on St. Mary Axe, and it is of a warehouse—one devoted to Japanese goods—that we are now about to write. In the sixteenth century it is probable that the inhabitants of the street were without direct trade with the Japanese islands, for the Dutchmen in those days were jealous and seeking a monopoly. If a jar or a lacquered dish found its way to St. Mary Axe, we may be sure that toll had been levied on it for the benefit of the States-General. It took a long time to bring the products of Japan into repute among us. Half of the nineteenth century had elapsed before our insular prejudices could be overcome, and the artistic wealth of the craftsman be fully recognised. When one considers the esteem in which their work is now held in England, it seems incredible that in the International Exhibition of 1851, not a single square foot of space was appropriated to the Japanese. What is more extraordinary, the absence of so interesting a people excited no regret.

All the floors in the large red-brick warehouse of Messrs. ROTTMANN, STROME & Co., in St. Mary Axe, are packed with objects which have been made by Japanese fingers. Pottery, metal-work, embroidery, lacquer, wood-carving, printed fabrics are here stored, and the house is the source from whence have been derived many of those things which are seen in London and provincial shops, ranging from little jars which cost a penny or two and give pleasure to humble virtuosi, to the costly screens which can hardly be seen without being coveted. The visitor finds in one place bales of cotton which have been woven in Manchester mills and printed in Japan, then he comes across piles of paper lamps, and has to pick his way with care through legions of jars, every one of them being as carefully enveloped in straw as if it were made of an eggshell; here we have lacquered panels for cabinets, elsewhere wooden tiles daintily ornamented and so on.

But what seems to be most remarkable is the immense space which is occupied by the rolls of Japanese wall-paper. Everyone knows how much effect can be gained by the use of that paper as an element in the decoration of houses, and that it seems to be equally well adapted for filling the panels in a cabinet, for a dado, a frieze, or the covering of a ceiling. But it is only on seeing the cases in Messrs. ROTTMANN, STROME & Co.'s warehouse that the extent of the daily demand for the paper can be realised. If an equal number of rolls of ordinary room papers were seen in a warehouse for paperhangings the stock would be considered to be rather large. It is found that purchasers of the papers generally require additional pieces, and to provide for contingencies a sufficient quantity of every pattern is kept. Incredible as it may seem, Japanese papers are as much subject as English papers or carpets to the absurd rule by which what are called "last season's patterns" become depreciated in value, no matter how great may be their beauty. In consequence of the desire for novelties there is a constant change going on in the cases, and the new arrivals find the best places awaiting them. A roll of paper may be a work of art, suggestive only of delight, but from the time of its production until every scrap is fixed (and very small scraps are utilised), it is as much subject to prosaic economical laws as corn or molasses. There is, however, one reservation to be made. Public taste is variable, often prefers debased work, and gives the highest price for ugliness; but to the credit of the producers it must be said that among the 150 patterns of papers which are to be seen in this warehouse, there is not one which indicates by its tawdriness or vulgarity that it has been specially prepared with an eye to the market.

We may divide the papers into two classes, viz., those which are from Japanese designs, and those which are adaptations of European designs—ancient and modern. The thickness in which the paper can be made, and the richness of colour which can be imparted to it, fit it for imitations of Venetian and Spanish leather and textile fabrics of the Renaissance age. Many artists prefer these imitations. The examples in Messrs. ROTTMANN, STROME & Co.'s rooms prove the versatility of the Japanese. The Renaissance designers were not so careful about the accuracy of the fruits, flowers,

and other natural forms as their Eastern copyists, but the Japanese have entered into the spirit of the originals and have preserved the rotundity and lusciousness of the pomegranates, apples and grapes. When the difference in the character between the two styles is remembered, the feat is remarkable, and in one respect especially so. In some of the Renaissance examples dragons, serpents, and more or less fabulous things have been introduced. To the eye of a Japanese they could hardly appear otherwise than ridiculous, for his countrymen alone are competent to create a form corresponding with the type that the mind fancies. But as an artist he must have felt that one of his own chimeras or gorgons—although it might excite terror—would not be in keeping with the other details, and therefore he has been faithful to his pattern. It would be difficult to exaggerate the richness of some of those reproductions of old Spanish, Italian, and Dutch designs. Attempts have been made to copy the originals before now, but the thick leathery paper of Japan is the only material that will bear the necessary depth of colour or allow of sufficient relief. The patterns vary from figures that are geometrical up to elaborate ornament that recalls the tissues painted by VERONESE; the richer varieties being better worth the trouble of producing in the material form the majority of the pieces.

The second class of papers includes all the designs which are Japanese, and it is interesting to compare them with those which are derived from Renaissance work. The latter are very rich and beautiful, but they are quickly exhausted; for the ornamentation of Europe at the time the originals were designed was limited in its variety. It may be said that almost every pattern that comes from Tokio surprises the beholder by its novelty. No matter whether it is an arrangement of a simple fret pattern, or of flowers, of serpents and dragons, or of Buddhist saints in all the glory of nimbi, there is a naïveté about the design which is unattainable by an artist who has undergone an European training. The laws by which the positions of the details of one of these patterns are fixed are not to be discovered by our academic rules. The Japanese artist probably obeys the inspiration of the moment; but however artlessly he may seem to work, it would be impossible for us with all our regularity to produce a better result. It has been sometimes said that the best examples of the art of Japan are those which are on a small scale, but whatever truth there may be in the observation, the details of the wall-papers should convince every one that the artists are as successful in designs which require great vigour of hand as they are in little things. In one pattern where stalks of grass, which are as large as nature, are thrown across the paper, the curves are as beautiful as any which can be found on the tiniest tea-cup. There are some pieces which appear to have been derived from modern French works, and in them the Japanese artist revels in the opportunity of treating flowers more rich than those of his own country. Seeing work of this kind, which denotes such marvellous capabilities, the question must arise, what is to be the future of the art of Japan? It is one which is easier asked than answered; but when we find that the eastern artist can so readily treat western forms, it is difficult to resist the conviction that his handiwork will, as time goes on, be more often seen in European houses.

The earliest specimens of Japanese wall-paper did not present many varieties in the colours of the ground, but Messrs. ROTTMANN, STROME & Co. have succeeded in obtaining papers that will correspond with almost every colour that is likely to be used in decoration. There are sufficient tones of brown, blue, green, and red to meet an architect's requirements. Gold is lavishly used in all the patterns, and there is one most effective paper which consists simply of dull gold, without a pattern, but the colour has that peculiar charm which belongs to the east.

The screens are allied to the papers as examples of surface decoration, and are no less deserving of study. The day is far distant when such elaborate works can be produced in this country at prices so moderate. In one which consists mainly of gold thread the subject is a contest between the powers of the air and of the sea, and the elements are suggested with a vigour that is sufficient to drive the students of a school of art-needlework into despair. In another screen flowers are embroidered in natural colours with a delicacy that is equal to that of a water-colour drawing. A third represents scenes from the everyday life of Japan. The figures are raised in three-quarter relief; but, such is the good taste of the artist, that we can think only of their quaintness.

The examples of Japanese art in pottery, woodwork, metal, &c., which are to be found in Messrs. ROTTMANN, STROME & Co.'s warehouse would repay description, but the limits of our space have compelled us to be content with a brief notice of what is intended to be employed for wall decoration. A visit to the warehouse will demonstrate that aids towards the beautifying of houses have been lately increased, through the enterprise and good taste of the owners.

### PARIS NOTES.

THE Committee charged with the arrangement for the internal decoration of the Hôtel de Ville have assigned the artists' commissions, subject only to formal ratification by the Municipal Council. Nearly all the great masters of the contemporary French School will be represented in the new building. M. Paul Baudry has been charged with the ceiling of the grand staircase (subject *Peace*), for which he will receive 162,000 frs. The central piece in the ceiling of the first saloon on the quay side of the Palace will represent *The Sciences*, to be painted by M. Bouguereau for 35,000 frs. The mural paintings in the same room will consist of allegorical figures by MM. E. Lévy, Feyen-Perrin, Jules Lefevre, and Hector Leroux, each work costing 18,000 frs.; a landscape, by M. Rapin, to cost 4,500 frs., and two views of Paris by MM. Benouville and de Cuzon, each to cost 12,000 frs. M. Bonnat will paint *The Arts* on the ceiling of the next room, and receive 35,000 frs., while MM. Maignan, Glaize, Humbert, and Morot are to decorate the walls and pillars, each receiving 12,000 frs. *Literature* is the subject given for the ceiling of the third saloon, and will be executed by M. Boulanger for 35,000 frs.; MM. Comerre (36,000 frs.), Gérôme and Jalabert (36,000 frs.), Bellel (4,500 frs.), with MM. Vernier and Vollon (12,000 frs.), have also been commissioned for this room. M. Galland is entrusted with the decoration of the grand gallery facing the quay, with thirteen paintings to represent the first discoveries of human genius—*The Age of Stone, The Discovery of Fire, The Conquest of the Horse, The Wheel, The Lever, The First Ship, &c.*, at a total of 160,000 frs. M. J. P. Laurens will contribute four historical compositions, illustrative of municipal liberties in the fourteenth century, for the room at the corner of the Place Lobau, at a cost of 70,000 frs., and M. P. Rousseau will paint a panel over the chimney-piece for 10,000 frs. M. Jobbé Duval has undertaken the ceiling of the Grand Dining Hall, the central piece to represent *The Feast of Pan and Ceres*, and the side panels *Flora and Pomona*, altogether costing 38,000 frs., and the tympana will be filled with figures of *Hunting, Fishing, The Vintage, Harvest, &c.*, by M. Felix Barras (23,000 frs.). The subjects chosen for the ceiling of the Salle des Fêtes are *Poetry*, by M. Hébert (38,000 frs.); *Music*, by M. Delaunay (30,000 frs.); and *Dancing*, by M. Lenepveu (30,000 frs.).

Among other artists who have received commissions are—M. Puvis de Chavannes, *The Four Seasons*, 25,000 frs.; M. Tony Robert-Fleury, *France*, 25,000 frs.; M. A. Cabanel, *The Four Elements* and *The Four Cardinal Points*, for eight panels, also seven tympana, *The Seven Ages*—in all 72,000 frs.; M. Numa Blanc, *The City of Paris*, 25,000 frs.; MM. Thirion and H. Lévy, *Commerce, Industry, Navigation, and Horticulture*, together 32,000 frs.; M. de Coninck, *The Seine, Marne, Sceaux, and St.-Denis*, 8,000 frs. apiece; and M. Cormon, *The Hours, Night, Twilight, Aurora, &c.*, 36,000 frs. The total credits proposed for the approval of the Council on this occasion amount to 1,550,000 frs., and many others for the internal decoration have to follow.

On the square in front of the Municipal Palace the works in connection with entrance approach or parvis, for which 410,000 frs. was lately voted by the Council, are now in full swing. A stone balustrade, with openings in face of the three entrances, is being constructed along the main front, while the two side doors will be surrounded by bronze columns, ornamented at the base with groups of figures. These columns will be surmounted with glass globes for the electric light. On either side of the principal entrance will be placed a seated bronze figure, representing respectively *Navigation* and *Commerce*. The stone balustrading is to be surmounted by numerous bronze gas-lamps, of artistic design, which at night will thus form a semicircle of illumination round the entrance.

Negotiations are being carried on by the Government for the purchase of Prince de Chimay's mansion on the Quai Malaquais, with a view to enlarging the École des Beaux-Arts. The price asked by the Prince is nearly 4,250,000 frs. (170,000*l.*).

The bronze statue of the *Venus de Medicis*, which, together with the *Gladiator*, also in bronze, always attracted such attention from visitors to the Park of Versailles, has lately been removed from the Bosquet de la Reine, and a marble statue substituted for it. The result of the change is most unfortunate, a bad effect being created by the contrast of the white new figure with the bronze *Gladiator*. The four bronze vases which were formerly in the bower have likewise disappeared.

The exhibition of designs submitted in competition for the 6,000 frs. prize in architecture, founded by Mdlle. Esther Leclère, in memory of her father, M. Achille Leclère, has been opened at the Mazarin Palace. The subject this year was *A Museum for a Country Town*. There were twelve competitors, the first prize being awarded to M. Georges Chedanne, a first mention to M. L. E. Masqueray, and a second mention to M. Eustache, a pupil of M. Ginain.

The Paris *Débats* a few days ago published the following note:—"In our columns of February 26 we reproduced a letter addressed by M. Maspéro to Mr. Scott Moncrieff, Under-Secretary for Public Works in Egypt, pointing out the insufficiency of the resources at his command for the continuation of his task, and for the preservation of monuments of Egyptian art and architecture. Mr. Scott Moncrieff, in publishing this letter, appealed to English men of science and to all interested in archæological work to aid M. Maspéro with funds. Several of our readers have thought it impossible for France to leave to England alone the honour of responding to the demand of our countryman, and have asked us to receive subscriptions in support of M. Maspéro's researches. We have great pleasure in complying with this desire, and shall transmit to the explorer any sums that may be forwarded to us." In response to this appeal 12,150 frs. have already come in within the space of four days, among the subscribers being the Barons Gustave, Alphonse, and Edmond de Rothschild, MM. Léon Say, Bischoffsheim, Joubert, De Reinach, &c.

At the meeting of the Académie des Sciences last week, M. Faye read the resolutions adopted by the committee appointed to consider Admiral Mouchev's proposal to transfer the Observatory to another site. The committee is favourable to its removal to some spot in the neighbourhood of Paris, but conditionally on the present buildings being preserved to their actual purpose, and that the necessary grounds for carrying out astronomical observations be kept. The matter will be further discussed in one of the private sittings of the Academy.

Last week the Parliamentary Committee of Inquiry into the industrial crisis, sitting under the presidency of M. Spuller, took the evidence of the roof-building contractors, of whom there are about 700 in Paris, 111 being members of the Syndical Society. The number of workmen generally employed in this branch of operative industry is estimated at 7,000, and there are three scales of wages. The tilers and metal roofers earn 7 frs. 50 c. per day; the plumbers and zinc workers 7 frs., and the assistants in both branches 5 frs. These wages are the same in summer as winter and when work is slack the rate is not diminished, but the best men are selected to continue while the others are discharged. The evidence of the masters showed that in 1852 the wages allowed to timber-roofers were 5 frs. 75 c., to plumbers 4 frs., and to assistants 3 frs. 75 c. In 1862 these rates had risen to 6 frs., 5 frs. 50 c., and 4 frs. respectively; while in 1872 they stood at 6 frs. 25 c., 6 frs., and 4 frs. 25 c. The advance to present rates occurred principally during the building boom that prevailed in Paris during 1882 and the early part of 1883. According to the masters there is at present no actual crisis in their trade, but merely a certain slackness.

Some delegates from the Paris Carpenters' Unions also gave evidence before the committee, complaining energetically that the extension of foreign competition was ruining them. The average wages received by carpenters were 8 frs. per day, but, counting 245

working days in the year, this amounted only to 5 frs. 38 c. daily, an amount totally insufficient, urged the speakers, to feed and bring up a family. They consequently claimed a minimum of 9 frs. for a day's work.

### THE ARCHITECTURAL ASSOCIATION.

AN ordinary meeting of the Association was held on Friday evening, the 29th ult., Mr. Cole A. Adams, President, in the chair. A vote of thanks was passed to Messrs. Braby & Co. in connection with the visit made to the Exhibition buildings, Battersea Park, and also to Mr. Trubshaw, for conducting the party. The next visit was announced for Saturday, March 8, to the new Oratory Church at Brompton. Mr. E. F. Eales then read the following paper:—

#### Dwellings in Flats.

The system of living in suites of apartments, called flats by us, has been in vogue for years in Paris, Vienna, Berlin, and in the principal cities of the United States; in fact, in Paris it is recognised as the correct way of living; but in England, the English being slow to adopt strange ideas, it has happened that until within the last eight or ten years no such system has been introduced, those whom flats are most suitable for, and those whom flats are most suited to, being content to exist in lodgings or boarding-houses, which, for expense and inconvenience, cannot be improved upon. The idea is still extant that there is an unwritten law about an Englishman's house being his castle, but this feeling is gradually dying out with sensible people, and little by little they are coming to look upon the advantage of occupying a set of chambers or (on a more extensive scale) a suite of rooms, as possibly an improvement upon the old way of living. As yet, I have never heard any one who has resided in a flat say that living in a small house (in the desired privacy) or in lodgings is preferable to the accommodation which can be obtained for the same or perhaps a trifle larger rental in a flat. This would point in favour of residential flats. In this great city of London it is essential to economise space, as day by day, for untold years, buildings have been erected which gradually have extended in all directions to what not a long time since we considered the suburbs. This economy of space is a great point for architects to consider, and as the population and business in the City increase, more accommodation is naturally required by those men who must not be too far away from their business, or too far away from what is called the fashionable quarter. If the idea were grasped that it is as healthy to live and breathe seven or eight storeys up in the air, and that every access by elevator can be obtained, we should see the same space which accommodated one family in a large house, say in Russell Square, very likely much too large for actual requirements (which means expense) would, by erecting a building on some site arranged in suites, accommodate at least six or more different families, and in this way if flats were erected in convenient neighbourhoods at convenient rentals, untold numbers would greatly prefer pitching their camp within easy distance of their work, instead of living in the suburban villa, which means for business men getting up at an unearthly hour in the morning to catch the train, and the same rush to catch it to return, not mentioning the travelling expenses, and the troubles arising from continual railway travelling.

The one great objection put forward by people is this same very excellent method of accommodating, say, six families under one roof, and using one staircase or elevator; but in this there is a great deal of fancy: if the staircase be well arranged and well lighted it becomes nothing more or less than an ordinary public staircase leading to entirely separate and self-contained tenements. With the advantages to be obtained the objections vanish, *i.e.* when a man finds that he is free from worry, trouble, and continual putting-hand-in-pocket business (as is the case with an ordinary householder), at the same time being able to enjoy the advantages of a separate establishment, he appreciates the difference, and almost looks forward to paying his quarter's rent with pleasure, feeling freed from all cares and household difficulties. Now, very different is the experience of a man who inhabits a newly-built house, built for the purpose of letting, and not comfort. Let us take it for granted, then, that the objection to living in flats has died a natural death, and that it has come to be looked upon as a most excellent method of economising space, relieving the tenant of trouble and responsibility, and giving the architect a chance of erecting a building which in its size must naturally offer more facilities for treatment than the usual London house. A few words as to site. From observation it would seem that this small world plays a large part in the development of this system, inasmuch as up to the present time it would be futile to build flats out of a convenient neighbourhood—by that I mean over a certain distance from Charing Cross—the people who are prepared to live in flats requiring to be near everything. This is evidenced by the number of flats which still remain unoccupied, not altogether on this account, but possibly from the inconvenient arrangement of plan which is to be found in some, more especially in those adapted from the ordinary dwelling-house, which you can well understand

has prevented their being treated as self-contained: another reason being that in some instances more accommodation is provided than is necessary or required, and a proportionately higher rent asked than is to be easily obtained. What, then, fixes the value of the ground is its proximity to the business centres, which is not only advantageous to the professional man, but to those who lead lives of pleasure, for which advantage larger rents than is customary to be paid for small private residences will, probably, be obtained. It is evident that this system of building must be in a measure speculative; no sane person would lay out a large sum of money in the erection of flats for the pleasure of letting people live in them at the expense of capital. There is no reason, then, why companies or syndicates should not be formed with the idea of erecting this class of building with good results. In Paris these large buildings are generally erected by the insurance offices, in America by limited companies or private individuals. An excellent description of a kind of syndicate for the promotion and development of flats is given by Mr. Gale in the published notes of his "Godwin Bursary Tour" to the United States, in which he says:—"A house, club, or co-operative building, in which each of several heads of families, by previous agreement, arranges each to own and occupy his rooms, thus giving the opportunity beforehand for each member to choose his associates in the affair, and it allows each to form an opinion of the desirability of his neighbours, thus avoiding the chance of proximity of undesirable persons or families under the same roof." The basis of the arrangement is this:—The property is vested in the members subscribing, and is held by them as a corporate body, which leases to each member his own apartment for ninety-nine years. This lease is marketable property, and can be sold like any lease of an ordinary kind. The arrangement makes the investment of the building-fund money a safe one, and one for which there is quite as much certainty of finding a sale as the lease of an ordinary house. Again, should an owner elect to sell his share, to guard against an objectionable person being admitted, each lease has a clause providing that only a person approved by a certain majority of members can be the purchaser of the lease. The expenses of service, supervision, repairs, warming, and lighting are equally divided. By this means a large and commodious block could be erected, giving each subscriber to the outlay very good security for his money, and enabling buildings to be erected which, unless several joined together to raise the required capital, would remain unbuilt. The idea is new in this country, and well worthy of consideration.

The French system of planning the *maison à loger*, or flat, appears to be divided into three classes. The first (of which I have a typical plan) shows a site with two frontages. The ground plan reveals the usual *porte cochère* for the accommodation of a carriage driving through to the inner courtyard. On the left of the entrance is the *concierge* and the principal staircase leading to the suite of flats above. These buildings, of course, vary in size. This present one provides three reception-rooms, three bedrooms, kitchen, and offices to each suite. Leading from the courtyard are the stables and servants' staircase leading to top floor. One great feature in all the French plans is the antechamber, which you enter, leading to each suite, from which the different rooms lead off. In all cases we find a secondary staircase from the basement to top floor for the servants and kitchen service. This is good in its way; but there are objections to it, as also to the arrangements for sleeping the servants, being crowded together indiscriminately upon the top floor. English people will object to this arrangement, as they prefer, and not unreasonably, that their servants should be within call, whether in the day or night, besides feeling a kind of responsibility for their welfare, which might be interfered with if this plan were followed, besides giving them opportunity to cultivate the female failing of gossiping. With regard to the stabling forming part of ground-floor, we have no instance in London of this arrangement, which, although convenient, yet if the same accommodation could be obtained in the neighbourhood of the building, undoubtedly would be preferred, and is not likely to be imitated here. On the upper floor the rooms communicate with one another throughout the suite. This plan gives a good arrangement of rooms, but I fear that the sites in London would not allow of an inner court—say 50 feet square—being left open to the sky, a greater economy of space being essential, as the ground rents in all instances asked are quite full, and the rents obtained very far below what the Parisians are accustomed to pay. Cellars are allotted to each tenant in the basement, which is devoted to stores for wine, coals, &c. No basement is devoted to living purposes, but we have to utilise this space for the sake of obtaining rent; but it would be far preferable if we followed the lead of the Parisians in this.

In the second-class plan the ground floor is devoted to shops, the entrance leading to main staircase and *concierge*. Here again we have the secondary staircase, but the number of rooms is less—two reception-rooms and three bedrooms, and kitchen. The staircases are lighted from wells on each side of main stairs. This arrangement is not good, inasmuch as the light cannot penetrate in a six-storey building to the ground floor, or, if it does, giving a very small quantity. Here we are reduced to one water-closet, which is a failing, as English people certainly will not be at all put

out if two are provided; the servants in this instance finding their accommodation in their own quarters. Another plan of this same class is devoted to shops on ground floor, and one suite only above. Here the staircase is lighted from the open, and it would be well to remember that in all instances it is desirable to obtain light to stairs, passages, and especially rooms from the street, either back or front.

The third-class plan shows the ground floor arranged as shops, there being a double frontage, the main entrance to each leading to the *concerge* and principal staircase as usual. Here the back arrangement for open space is well contrived, the party wall being kept down to height of ground storey, and open above to the extent of the two houses. On the floors above the accommodation is not large—two reception-rooms, two bedrooms, kitchen, and water-closet. The height of these buildings in Paris is regulated by the width of the streets, and does not exceed five storeys, including the *entresol* over the ground floor. The suites are arranged from three to fifteen rooms, the rent varying according to locality. Large numbers of very handsome buildings of this kind have been erected during the last few years in distinction to what we know as private houses, which are, comparatively speaking, scarce. The American architects have already built some very fine blocks, consisting of single suites up to six on each floor, and being under one roof.

Beginning with an ordinary suite, let us examine the plan of a building called "Wyoming." This has three frontages, which in planning is a great advantage; a central staircase lighted from a well-hole and top light, which is the great drawback to the plan, otherwise the arrangement is very workable. Entrances are to right and left of main staircase, the elevator being worked in well-hole of same. Here we have the secondary staircase communicating with servants' offices, and you will notice this is arranged so that the kitchen in each of the two suites shall be of easy access. The sleeping and reception rooms are rather mixed up; but the size and number of rooms is all that could be desired. The secondary water-closets are badly placed, as also the servants' bedroom, left-hand suite leading direct out of kitchen. The dining-rooms might be another 18 inches wider with advantage, 13 feet not being sufficient. A very ingenious contrivance for additional room in the rear of a block is shown by the plan of an apartment house, close to the Broadway, where an attempt has been made to keep to the form of the city lots, which are 25 feet frontage by 100 feet depth. In this instance two of these lots are taken together, giving a frontage of 50 feet. There is a basement and sub-basement, the remaining floors being 14 feet high from floor to floor, the two top floors being 9 feet. The rear portion of the building has 10 floors above the basement, each 9 feet high. This difference in the number of floors in the two parts of the house is designed to give more accommodation and light. The plan shows the way in which the second, fourth, and sixth floors are laid out. The entrance is arranged in the middle, leading to main staircase, the elevator being constructed in the well-hole; entrances on right and left to the separate suites. Taking the one part of the plan, it will be seen that there are a private hall, library, parlour, and dining-room, butler's pantry, kitchen, and five chambers; the staircase by the side of dining-room leads downward a few feet to the rear part of the building, all the rooms here being on a different level. The small staircase in butler's room leads to an upper room, which can be used as a store. The other part of the plan and section of the rear go together, the rear portion of the two flats being over one another; hence the name given to these flats, Duplex or Double Flats.

The accommodation is the same on each side, excepting the rear part of one is approached by stairs leading up, and the other by a flight going down. The intervening floors—first, third, and fifth—are all on the same level, the house being simply divided through the centre with two sets of apartments. The staircase in this instance is left entirely to a top light, and of necessity must be very dark. "The Berkshire" is a very well-arranged plan taken as a whole; it has the benefit of being lighted on four sides. The rooms are well proportioned, each suite containing three reception-rooms, four and five bedrooms respectively, kitchen, bath, and water-closets. Here, again, the two kitchens are brought together and served by secondary staircase. The main entrance has a borrowed light, and I presume a lantern at top, but no direct light or ventilation, which mars the otherwise skilful treatment. Here the reception-rooms are kept distinct from the bedrooms, and the kitchen and servants' room distinct again, being approached by a lobby, which entirely shuts off direct communication with the remainder of the flat. The Americans are good in providing cupboard accommodation, especially to the bedrooms. Another point is the fixed washing arrangement in each bedroom, in lieu of our washhand-stand.

Another plan much more extensive, embracing as it does six suites on a floor, occupies an excellent site to deal with, about 210 feet square. The French system of an internal court is adhered to, and which in this instance is 100 feet by 90 feet, less the projection of kitchens, &c., belonging to two of the largest suites. This block has frontages to three streets, the fourth being set back for the purposes of light; the architect has thus been enabled to have an entrance from two of them. The principal entrance is

wide enough for a carriage to pass through and set down at the four different entrances. The accommodation provided is eight bedrooms, three reception-rooms, kitchen, and offices. The staircases are well lighted, and each suite is provided with an elevator, delivering by the side of each entrance. Of course, this is an ideal site to have to deal with, and I do not suppose there are likely to be many similar to it in this city; in fact, the extensiveness of the whole block is more than at present we have requirement for. The rents obtained for these suites is 600*l.*, slightly more than is likely to be given for a similar suite of rooms in London.

The last American plan is still more extensive, and is in course of erection. The central part apartments, designed by Messrs. Hubert & Pirsson, architects, consists of a series of eight blocks, occupying a plot of 210 feet by 425 feet. Each block has a frontage of about 100 feet, and contains thirteen suites, three of which occupy the whole surface of the building—that is, a surface of 7,800 square feet—and ten of which occupy one-half the frontage by the whole depth, with the duplex arrangement at the rear for kitchens, servants' rooms, &c.—*i.e.* an area of 4,700 feet. The cost of the four corner blocks is put down at 56,000*l.*, the rest at about 50,000*l.* each. An independent company, free from personal liability, is organised for each house, and the capital stock is divided into sixteen shares, each share representing an apartment occupying half a floor. Those wishing to occupy a whole floor would secure two shares. Two-thirds of the outlay (put at 240,000*dols.*) is subscribed—*viz.* 160,000*dols.* amongst sixteen shareholders, giving an equivalent of 10,000*dols.*, or 2,000*l.*, to be found by each, the remaining third of outlay being raised on mortgage. The ground rents and all outgoings by way of interest on mortgage, rates and taxes, salaries for service, &c., is equally divided, and for a single share amounts to about 260*l.*, making the total rent, including the interest of 6 per cent. on the subscribed capital of 2,000*l.*, up to 380*l.* per annum rental; the accommodation being three reception-rooms, five bedrooms, kitchen, servants' offices, bath-room, &c. The accommodation in the apartment occupying the whole floor being four reception-rooms and hall, seven bedrooms, kitchen, and servants' offices, and for which an annual rental of 760*l.* is paid. These buildings are constructed substantially, and are so far fireproof as iron beams, brick arches, iron stairs, &c., can make them. There are two elevators serving each suite, the rear one being in connection with the entrance to the kitchens. The whole building is warmed by steam, which is conveyed by pipes to each room, and then heats the room by means of direct radiation from a coil of pipes which are placed under the window or in some convenient position. This item of warming by steam power makes a considerable difference in a man's coal bill. Boiling water is also supplied throughout the apartment by means of a boiler in the basement, a second boiler also working the pumping arrangements for the cistern at top of house, which provides the head of water required for the hydraulic elevators, and supplying the required steam power for heating purposes.

The larger blocks erected by the Americans are carried up to ten or more floors, the same varying from 15 feet in height downwards: this means a lofty building. The only high building of this kind that we have is known to all, and that is thirteen stories in part. The Queen Anne's Mansions referred to, erected a few years since, comprise an enormous pile of buildings of very dismal appearance, having a very bad approach; the upper floors, however, have a good view over St. James's Park, which has to make up for many deficiencies. The building is more or less a large hotel, arranged in suites of apartments, the *cuisine* being entirely separate and provided by the owners at a certain tariff. The *cuisine* arrangements provided are certainly advantageous to some people, especially in small tenements where there is no room for kitchen accommodation, even if required; but what is understood by "self-contained" should mean that all such necessary offices should be provided in each suite, so that a tenant can do exactly as he pleases, and, in fact, have the accommodation of an entire house arranged on one floor—unless this is provided the suites become more or less chambers. The space which these offices would occupy could certainly be utilised as bedrooms to advantage, and the general kitchens would occupy the basement; but unless this system is carried out on a large scale like the Queen Anne's Mansions, I fear the caterer would make but a poor livelihood. This is about the only site where this enormous height would be allowed; and, after all, it is a question whether, say, nine storeys is not high enough. This would be something like 130 feet above the pavement. It is not these colossal buildings which will be most patronised, but those accommodating say, 12 families at the most. Of the flats in London, the majority you will find of the medium height, although in Victoria Street, Westminster, a large block of nine storeys is now being completed, providing suites of 17 rooms, very well planned and well lighted; but the rent required to pay a decent interest on the outlay must be something considerable, and likely to be beyond the reach of many people at the present time. This street seems to be made up of these buildings; but the entrances, almost without exception, are very dark, and I understand the internal arrangement anything but good. We have not yet developed in this country our appreciation of flats sufficiently to warrant the building of these suites upon the

extensive scale that some are now being erected—that is to say with any likelihood of their being occupied, for the general applicant for a flat seems to be one who is willing to expend, say, 150*l.* up to 200*l.* in rent. In extremely good positions, of course, such as Piccadilly, Park Lane, and a few other expensive localities, fabulous rents might be obtained; in fact, in Piccadilly I am informed that a suite of three rooms and bath-room on first floor fetch 400*l.* per annum, and two rooms and bath-room on second floor 200*l.* per annum.

Another point in considering these lofty buildings is the absolute necessity of travelling by elevator, which, although delighted in by our American friends, yet not one person in twelve over here cares about the motion and dubious sensations which are experienced. Now, by building with, say, six floors above the ground, this necessity is done away with, as well as the entire outlay, which is not inconsiderable, and the expense of attendance upon same ever after; but of course in large and lofty buildings it is essential that this accommodation should be provided and used at pleasure. The outlay required to provide an elevator—say, to serve six floors—is between 400*l.* and 500*l.*; the wages of an attendant and water-rate would bring the annual expense to about 800*l.* It is a question, therefore, unless a building is more than five floors above the ground, whether this means of gaining access to the upper regions is warranted—for in a building of the number of floors mentioned the same rent can be obtained whether this additional accommodation is provided or not. Another drawback to excessive altitudes is the proportionate bulkiness of the walls, which, as you know, are regulated in thickness by their height, the sacrifice of ground area thereby, and the interference with free ventilation, and, most certainly, of light. Unfortunately, there is no restrictive power preventing a building going up to unlimited height in an old street which may be narrow in the bargain; but the 85th section of the Metropolitan Local Management Amendment Act lays down the rule that no building in any new street of a less width than 50 feet (except a church or chapel) shall exceed in height the width of the street without the consent of the Board of Works; so in streets over 50 feet in width there is absolutely no control as to height. The Metropolitan Building Act, however, carefully confines us to the superficial area, which, in the case of building flats, becomes rather irksome. I allude to the 27th section, which will not allow you to build (if the area exceeds 3,600 square feet), without providing party walls vertically and party arches, and fireproof floors separating the different tenements.

One of the essential points in the erection of these large buildings occupied by different families is, that they should be constructed of fireproof materials so far as is possible, and ready means of egress provided in case of necessity; so, perhaps the stringency of the Act in the way of precaution is not to be regretted.

The most convenient form of plan for a site of ordinary dimensions is an elongated parallelogram, having front and back light; but it is so seldom that a straightforward piece of ground is to be had that it is rather futile to say what shape is most workable, as upon an ideal site an ideal plan could be arranged. This plan is 105 feet frontage, with central entrance, the suites being entered right and left. Ample light is obtained both to back rooms and passages: this leaves three good rooms in front, consisting of dining-room, drawing-room, and best bedroom. The number of bedrooms mostly asked for is four, and in a family suite should be never less. To this add the kitchen and offices, bath-room, and two water-closets. This amount of accommodation seems to be all that is required by the ordinary applicant. The correct and best arrangement, where possible, is to have the bedrooms separated from the kitchen and servants' part by the reception-rooms. The kitchen should be in close proximity to the dining-room, for obvious reasons, and in these medium-sized suites it is well to provide a hatch between the two rooms, with small shelf, so that one servant may serve from the kitchen to the servant inside the dining-room. Some people are dreadfully frightened in case any smells of cooking should penetrate through this opening to the dining-room; but if properly attended to, the danger of being objectionable can be overcome. The passages should be as wide as practicable, and never less than 3 feet 6 inches clear, with light at end or side, so that the windows may be opened, and a current of fresh air admitted, and the whole suite kept pure and fresh. In these long frontages we must not forget that the Amendment Act comes upon us; until this came in vogue the Building Act, sect. 29, required only (as it does still in building upon old sites) an open area of 100 feet super in the rear or on the side of any dwelling-house, unless otherwise lighted from a street or alley; but now, in the case of new sites, any frontage over 30 feet, according to the progressive scale laid down by the Amendment Act of 1882, must have an open space in the rear exclusively belonging thereto of 450 feet super. If only six suites are required, a frontage of 37 feet to 40 feet, and depth of 80 feet, will allow of a very workable plan as this:—By having the entrance at the side you are enabled to obtain two good rooms in front, and keep the self-contained principle on each floor. In this plan the position of kitchen is handy to the dining-room, and the bedrooms follow right and left of passage, which is lighted by a window at the end, which is an advantage, as I explained before, for the purpose of ventilation. In many buildings not only are the staircases dark, but the internal

passages are without windows, or lighted from small well-holes. If you must have these wells, line them with white glazed bricks. For accommodating twelve suites with, say, a frontage of 80 feet, requires a depth of about 70 feet, and this plan has been schemed to provide the same amount of accommodation as before, but having two suites on each floor. Here we have a central staircase lighted direct; two rooms in front instead of three, as is shown in the plan, with longer frontage, four bedrooms, and offices. This plan works very well in execution, is well lighted, and is tolerably compact, and, with an easy staircase, forms a fair example of the medium-sized flat. Another plan now being carried out shows a block with three frontages, which, of course, is a great advantage, so far as lighting is concerned; but the shape of site is not a very easy one to turn to good account. The staircase has been placed internally, obtaining light from the back, the rooms being arranged round it. The ground plan shows the building arranged for two suites on a floor, with separate entrances. Here we get an entrance hall in each case, also lighted direct. The usual accommodation is provided, the rooms are of fair size and proportion, and on the first floor and upwards can be used as one suite or two at pleasure of tenant. The staircase is lighted at the top by a lantern light in addition to the side windows, on account of some portion of the light being obscured by the elevator, which is to be worked in the well-hole of same, and serving six storeys above ground floor.

*Staircases.*—This part of the subject deserves a separate heading; it should be as I have before mentioned, one of the first and principal points in a plan. How much more inviting is it to go into a building and find a bold, handsome staircase well lighted, the stairs at least 4 feet wide, of easy rise, the walls finished with some show of decoration, which though not obtrusive, yet sufficiently attended to to give the visitor, as it were, an appetite for further exploration, than it is to find one's self, as in some cases, in a narrow, bare, dark, dreary passage with a breakneck staircase, the walls simply distempered with a dark brown dado or perhaps not even this, the hall finished with plain York paving, and everything as cheerless as could be desired. Surely a little money in this direction is well laid out. In the staircases of many of the new flats in Paris, you will find the walls panelled and lined with polished marble slabs, the treads of stairs lined with white marble and carpeted, leaving the impression that you are in some private mansion rather than one occupied by some dozen families. I am sure those intending planning flats will reap satisfaction if they give their best attention to this part of the arrangement of plan. As to the construction of the stairs they should of course be of fireproof material, as is required by the Building Act (sec. 22), which demands that in every building containing more than 125,000 cubic feet, and used as a dwelling-house for separate families, the floors of the lobbies, corridors, passages, and landings, and also flights of stairs shall be of stone or other fireproof material. In the flats known as Hyde Park Mansions, they have been carried out in Portland cement concrete; in some instances the treads are cast separately, and pinned in after walls have settled, the landings being pinned in and carried by light iron girders; in other instances they have been cast in whole flights *in situ*. A mould of the flight is carefully made and supported by struts, a chace for the end of each step being cut in wall, and when ready, the mould is filled and allowed to stand some three or four weeks and then removed, leaving a very clean staircase. This method is cheaper than fixing the treads separately, on account of the labour required in fixing, this material being very heavy and rather difficult to handle. The cost of the latter process is about 12*l.* per single flight of twenty steps and landing, as against 20*l.* if fixed separately. The treads are finished with a fine face, and when thoroughly dry have a clean appearance. To add to the lightness, glazed tiles have been inserted in the risers, which relieves the mass of greyish colour and gives somewhat of a finish to the whole. Lining the treads and landings with marble makes an excellent finish so far as appearance is concerned; but it necessitates carpets being used, otherwise a good deal of slipping about would be experienced with some few broken bones to mend. It is a moot question whether it is advantageous to carpet the staircase, as from experience we find that, with even the traffic in an ordinary dwelling-house, stair-carpets soon become shabby; and so the question is whether it is not better to leave the stone or concrete, as the case may be, in its nakedness, taking care to have the strings and margins painted, and the remainder kept as clean as possible. The landings in the staircases of the flats mentioned are finished with tiles in some cases, in others with tesserae, chips of marble, formed in patterns, which makes a clean and bright finish. In these flats I have endeavoured to add to the prominence of the staircase by providing a large landing on each floor, running from the stairs to the front of house, with a glazed screen, in which can be introduced coloured glass, and, if necessary, can be fitted up with settees or made useful in many ways, as well as being an aid to ventilation.

Before quitting the staircase there is a point which also strikes me as being worthy of note, and that is the egress on to roof in almost every house you go into. I have met with but one exception. You find that the way on to the roof is through a small trap-door in top floor ceiling, this averaging about 18 inches or

2 feet square, scarcely large enough for a small man to get through, and very awkward for fleshy ones. After straining the muscles of your legs from standing on a rickety step-ladder (which is not always forthcoming), you get into the roof, and by this time in a filthy condition. You now come to another trap-door, which in all probability you will find bolted, and, bolts being rusty, refuse to move. This said trap is covered with lead to make things heavier, and when you get this open would have been time enough (if there should happen to be a fire going on) to have suffocated everybody anxious to get out. Besides, how inconvenient for females, who generally have pluck enough in most things, yet hardly like squeezing through a hole without knowing where they are going to. To obviate this inconvenience I always carry out the following arrangement:—From the top landing, form a narrow flight of stairs with handrail and balusters, leading to a landing at top and with a sufficient headway to stand up, say 7 feet, formed as a dormer to the roof; unlock the door and you are out, either in a gutter or on a flat, without trouble, inconvenience, or dirt, besides yielding an opportunity for householders to take a survey of their tiles or gutters and make themselves acquainted with what one in a thousand never troubles his or her head about. The buildings in question are furnished with high-pitched roofs, with cellars, leaving ample room to form cubicles, with a central passage; these are devoted to each tenant as a box-room, and are most convenient. The door leading to this part is shut at a certain hour, and each tenant is under certain responsibilities as to usage.

*Secondary Stairs.*—Most of the plans we have seen this evening have a secondary staircase provided for the use of servants, and it is essential that there should be a method of tradesmen communicating with the kitchens without using the principal staircase. There are many objections to its use, as being an incentive to misbehaviour on the part of domestics, as also a loophole for servants of other suites congregating and becoming a nuisance in more ways than one. The plan adopted in Hyde Park Mansions is to have a lift, say 3 feet by 2 feet 6 inches, serving each kitchen from the basement, and, as the kitchens are all at the rear, the lift is out of the way. At the basement level a pair of folding doors open, and the lift is exposed to view. On one side of opening is a list of the tenants with their respective suites, number, and floor, and a speaking-tube to the kitchen of each. The tradesman comes with his order, whistles to the cook, say of No. E second floor; she replies, the man puts his basket or what not in the lift, and pulling the rope the lift arrives at its destination, and, when emptied, comes down again to the basement. This arrangement has been in work some three years, and answers well enough at any rate for a substitute to the secondary staircase—which means space, expense, and possible annoyance.

There should be two water-closets to every suite; one can be in the bath-room, if space is to be economised, and the other in the neighbourhood of the servants' part, and, if possible, with a lobby to same open to external air. Be careful not to place a water-closet just as you enter the flat; contrive it where it will not be obtrusive, and, by all means, with a window to external air. All the soil-pipes should be carried down outside, and left open at top, and trapped at bottom; and be careful that any repairs to a tenant's pipes can be rectified from his own premises, without having to go into the suite above or below, as the case may be. Ventilating each apparatus by a pipe going up to roof, deliver the rain-water pipes open on to syphon traps, turning the wastes from lavatory and bath into same—this simple system answers as well as can be wished. In the flats alluded to we have a constant supply served by a 1½-inch rising main running from bottom to top of building, with branches on each floor to suite and cisterns, with a draw-off at sink from the rising main and one from a cistern; the precaution of the two draw-offs being in case the constant supply should be stopped by reason of repair or accidents, when the supply can be obtained from the cistern in reserve. Each water-closet has a separate cistern. The baths are served with hot and cold, with circulating pipes from kitchen boiler in each instance; the lavatories being supplied from same source. This method of supplying hot water, totally distinct in each suite of rooms, is by some considered more agreeable than having furnaces in the basement which supply the whole building, which in the case of medium-sized flats would be hardly of sufficient advantage to warrant this outlay. It is customary when there are furnaces to have hot-air flues in the staircase walls with hit-and-miss gratings, so that the hot air may be regulated both on the staircase side and also in the private hall of each suite. It is only in the winter months, however, that the staircase requires warming, and when there is a plentiful supply of gas-burners, which in the dark months are brought into requisition in the early morning and afternoon, the staircase becomes warmed without the aid of hot-air flues. This is the case in staircases which are 14 feet by 10 feet.

*Ventilation.*—When the windows open to the open air, and each room has a fireplace and ventilator communicating with external air, there is every chance that the rooms may be kept fresh without calling in the aid of shafts and tubes and elaborate experiments which generally end by blowing one's head off, or being stuffed up to spite their inventor. To aid the idea of independent ventilation in these buildings, the top sash of the windows in most instances is made to hang, and finished with casements underneath, an

arrangement which, when there is a balcony provided, is of much more convenience than the double-hung sash. By this means the top sash is opened at pleasure, and in the summer the casements can be thrown open, thus gaining the advantages of each. Following on ventilation we come to the means of getting rid of the dust and rubbish accumulating daily. This is done by making use of a flue provided in the neighbourhood of each kitchen, fitted with an iron door and cheeks, with indiarubber rabbetted rim, so that it may be air-tight. This flue communicates direct to the basement, where there are large receptacles sunk below the yard level, which are emptied twice a week. This saves a great deal of trouble in carrying the refuse down, or sending it in the lift. The place is thus kept sweet, and the process of collecting being carried out in the early morning, does away with a possible nuisance.

*Internal Finishings.*—The two principal rooms should be so arranged that they can be thrown into one, as occasion may require, which can be done by one of three ways—by having folding doors, sliding doors, or revolving wooden shutters. The drawback to the first is that so much room is taken up when folded; the second destroys the walls; and the last is cumbersome, as the boxing must show below the ceiling line, and when finished looks anything but well. The Americans patronise the sliding doors, which is certainly the most convenient arrangement. The rooms should not be too lofty on account of the expense, unless the Duplex system is required, when it necessitates having the front rooms 14 feet at least, the average height for the best floors 11 feet, finishing with 9 feet at top. This height enables you to get ample window light. The interior of rooms is improved by introducing bay windows, either circular, splayed, or square; the preference is generally given to the circular. These windows, as well as improving the appearance internally, help to break a monotonous elevation, especially if balconies are provided to the principal rooms—a feature which forms a substantial item towards letting purposes. These balconies give the tenant (if he is some distance up from the earth) the opportunity of feasting his eyes upon flower boxes, which will not only make his own rooms pleasant, but will make up to him partly the lost pleasure of seeing what is going on in the lower regions, which, at the second floor of a lofty building, he could not do unless standing on the balcony. The principal rooms should have speaking-tubes provided, communicating with the kitchen, which should be fitted with as many cupboards as can conveniently be obtained. The coal bunk need not be large, as it can be replenished from the vaults in basement which are allotted to each tenant. The ladder should be placed so as to get external air; all the necessary fittings for kitchen and scullery purposes provided. Each entrance door should have number, with bell, letter-box, and private latch to door. In place of the *conciierge*, or the American janitor, who require two rooms at least allotted to them, and are both an expense, we have substituted a small tablet in the entrance hall of each block of flats. A neat tablet is fixed on each side of entrance hall, with the names of the tenants printed thereon, with their corresponding number or letter and floor. In a line with the name is a slip with "in" or "out," which can be manipulated at pleasure, enabling the tenant to let any caller know if he is within or not, thereby saving the visitor the trouble of travelling up the staircase, perhaps to be disappointed. As each suite is entirely self-contained, with a separate entrance door, there is no necessity to lock the main entrance door, which can be opened by anyone up to a certain hour, after which each tenant uses a pass key. This arrangement meets every requirement. If any special inquiry be needed, the applicant simply adjourns to the manager's office, or consults porters, who patrol the buildings without intermission day and night, who are more alert, and therefore more useful as custodians, than the *conciierge*, who remains at his post as a fixture. With the exception of gas (each tenant having a private meter), everything is provided in these flats, the use of telephone included, the tenant simply paying his quarterly rent.

It would be a mistake to pass over a point connected with flat building, which has forced itself upon the notice of many, especially as we are now considering the propriety of developing buildings arranged in flats, and it is this—the eagerness to snatch at anything that is new; in this instance flats. No sooner than an idea has been started and carried out, and proved to be capable of producing a fair return upon an outlay, than hundreds rush, thinking to do the same; not by using common sense and supplying a want, but in supplying what we are at present not ripe for: I allude to the extensive and expensive buildings which are now going up arranged as flats, for which rentals must be paid to recoup the investor larger than there is any likelihood of obtaining. A man of ordinary income thinks, upon seeking a house, that a rent of 150*l.* per annum is (and he is right) a sufficient sum to pay for being housed; add to this another 50*l.* for rates and taxes, making roughly 200*l.* per annum. How many men can afford to pay this sum in rent? Those who can mostly prefer having a house to themselves rather than a flat; yet we see and hear of suites starting at rents of 500*l.*, and going up to much larger figures. This is wrong: those who require flats are those enjoying moderate incomes, and require to economise what they have. If suites can be obtained from 100*l.* to 150*l.*, then the new system is likely to be patronised; but so long as buildings are erected in

an extravagant manner, regardless of what people are able to pay, then surely some of these undertakings which are now in hand will stand idle. Look at Paris, which during the last ten years has been erecting huge buildings for this purpose, the result being, we hear, stagnation of acres of property. Why? Because they have been built on too large and extravagant a scale, and the people are not forthcoming to take them. Those who intend following up this method of building will do well to consider this, and although producing a tenable and taking building, will endeavour to do so with medium views, affording as much and as convenient accommodation as is in their power, with a view to letting the same at a reasonable rental, bearing in mind that at present and for some long time to come the men of independent means will prefer living as they live now—in their town houses, and the people they have (in a word) to cater for are those who lead busy lives and enjoy, comparatively speaking, but small incomes. What we really want are fair-sized, well-proportioned rooms, with plenty of air and light, large and easy staircases, well-ventilated, well-lighted passages, every room having a window to the open air (wellholes being abominations), with a fireplace in each supplied with all the conveniences and finished with some show of taste.

The PRESIDENT in opening the discussion said that residential flats for London was a question that had of late been forcing itself into consideration, and one that would force itself more and more to the front. The growth of London had been enormous, and the only extension possible was upwards, as far as regarded the headquarters of business, literature, art, &c. He considered it ought to be possible to construct dwellings within a reasonable distance of such centres. This would of course demand a thorough knowledge of planning, so that space could be utilised to the utmost, and in the opinion of persons qualified to judge it would be a question of utilising not only every foot of space but every inch. Massing population in this way on a small area would necessitate extra precautions and further legislation in regard of fire and sanitary matters, and among such matters it would have to be considered how best to deal with outbreaks of contagious illness, or in the case of fire, how to avert panics and fatalities from the occupants crowding down the staircase. In residential flats the roofs must certainly be not only fireproof but easy of access, and balconies should also be provided where the occupants could take refuge in case of fire. The development of the system of flats for dwelling purposes would, however, depend on questions of cost and finance.

Mr. GOTCH said he rose to propose a vote of thanks to Mr. Eales rather than to pass any remarks. He considered, however, that the large rentals asked for flats were prohibitive. The money asked for a flat would enable a person to pay his railway journey to town, live in the country in a house to himself, and have the enjoyment of a good garden—and this latter English people had a great liking for. The system of living in flats seemed to work well in Paris, but Frenchmen were different from Englishmen, who were insular in their tastes. The Frenchman cared little for privacy, or for sanitary matters, nor did they care about gardens as English people did.

Mr. LOVEGROVE seconded the vote of thanks. In the course of his observations he alluded to some unhappy experiences of living in flats run up by speculative builders. The question of cost combined with proper planning and sanitary arrangements would require careful consideration.

Mr. TUCKER (of the Queen Anne Mansions) said that floors must not only be fireproof but sound-proof, a point overlooked in almost all London flats. A second staircase, he thought, was a *sine quâ non*. In case of fire, smoke would probably not affect both the main and back staircase. The Americans were far ahead of other countries in the matter of elevators. As to the danger of the shafts acting as flues in an outbreak of fire, in providing the necessary hydraulic apparatus provision also existed against fire in the way of water-tanks and pumping machinery, and a column of water as thick as a man's leg could be sent up the shaft. A dwarf passage, with a swing door at each end, should separate the kitchen from the other rooms, and a window, if possible, provided in the passage, the draught of which, when open, would set towards the kitchen. The top floor in flats ought really to be the dearest in the building. Even for people in delicate health it was the best part of the building. There was a beautiful light, total absence of sound, and freedom from dust and soot. A house of ten rooms, at 7½. a room, would amount to a rental of 70½. If flats of ten rooms could be had for 70½., 80½., or even 90½., they would let not by scores or hundreds, but by thousands.

Mr. HUNTER remarked that dining out in restaurants, as was the practice in America and France, saved the space which would have been otherwise taken up by kitchens.

The vote was then put to the meeting by the President, and carried unanimously. Mr. Eales replied, and the proceedings terminated.

Messrs. T. & R. Boote, of Waterloo Potteries and Encaustic Tile Works, Burslem, have been awarded a gold medal for their exhibits at the Calcutta Exhibition.

## THE CASTELLANI COLLECTION.

THE well-known dealer in works of art, Signor Alessandro Castellani, died after a comparatively brief illness towards the close of last year. As soon as it was known that his collection would be sold, Prince Baldassare Odescalchi, from his place in the Chamber of Deputies, called the attention of the Government to the fact, and suggested the desirability of the State making the largest possible acquisitions at the sale. To this proposal a favourable reply was given by Signor Bacelli, the Minister of Public Instruction and Fine Art. A committee was then appointed to examine and report on the collection. The committee was composed of the directors of the principal Italian museums and other authorities on art, having for president the distinguished archæologist, Signor de Rossi. At the same time, the Syndic of Rome, Duke Leopold Torlonia, convened a meeting of deputies, which included Signori Minghetti, Baracco, Bertani, Cairoli, Crispi, Visconti-Venosta, Prince Belmonti, and Prince Odescalchi, to discuss the possibility of securing the collection for the National Museum. The result of the deliberations of the committee was a recommendation that the Government should anticipate the sale by purchasing the collection *en bloc*, if there was any possibility of such arrangement being made with the executors of the late Signor Castellani. It is computed that the total value of the works is between two and three millions of lire. The primary reason adduced by the committee in support of the demand for a grant from Government is the value of the finest examples of ancient art for elevating the taste of the modern workmen and thus assisting the development of the national industries. In the event of the Italian Government not coming to an agreement with the representatives of the family the sale will begin on the 17th instant and continue until April 10.

## THE NICE EXHIBITION.

THE Exhibition of Fine Arts at Nice has been described in an article by M. Louis Brès in the *Courrier de l'Art*. The opening has been an important event for that favoured province, and it is anticipated that the result will be an increased interest in art on the part of the visitors. It is the first attempt at an exhibition in Nice, and so far it has been a success. In some respects it differs from the ordinary provincial exhibitions of France, in which meritorious examples of art are lost in a crowd of commonplace works, and works which have been refused admission into Paris Salons. The aim of the promoters of the Nice Exhibition, on the contrary, has been to secure a collection of the selected pictures by French and foreign artists, and to present them in the most attractive way. The artists have cheerfully responded to the invitation of the committee, and for once quality and quantity have been united. There are about 3,000 pictures in the Exhibition, of which two-thirds are by French artists. They are distributed through sixteen rooms, nine of which are devoted to the French school.

The French works comprise 1,500 oil paintings, 300 water-colour drawings, designs, enamels, and miniatures; 200 pieces of sculpture, 100 engravings, and 50 architectural designs. In the foreign section Belgium and Italy are the principal representatives. The contributions consist of 650 oil paintings, 50 engravings and drawings. There are 376 works in sculpture—all of which have been sent from Italy. The French school is represented in a manner sufficiently complete. A large part of the work in the last Salons has been transferred *en bloc*. This fact gives assurance that the collection is modern, but it should be added that the selection has been made with intelligence. Among the French artists who have sent works to Nice are the following, viz.:—MM. Henner, Yon, Guillemet, Rapin, Français, Morot, Tattetgrain, Léon Comerre, Léon Gégé, Edouard Frère, Charles Frère, Jeannin, Dantan, Auguin, Binet, Emile Brisset, Brispot, Beyle, Feyen-Perrin, Delahaye, Bettannier, Jenoudet, Appian, Astruc, Couturier, Saint Pierre, Benjamin Constant, Geoffroy, Pelouse, Veyrassat, Carrier Belleuse, Harpignies, Paul Robert, Monténard, Pointalin, Robinet, Saintin, Vernier, Paul Sain, Perret, Moreau-Vauthier, Lagrand, Lesrel, Maillard, Allègre, Aublet, Beauverie, Benner, and Alphonse Moutte. The names of the principal Belgian and Italian painters appear in the catalogue, and among the other foreigners are Messrs. Smith Hald, Boggs, Ayrton, Bridgman, and Wyllie. In fact the Exhibition is a reunion of works of great interest, and although some Parisians may think there is little novelty in the pictures, yet as they are of real value and indicate the present condition of contemporary art, there should be pleasure in seeing them again. The exhibition building is situated on a plateau in the Quartier de Saint-Etienne, at a short distance from the railway station, and was erected in the course of a few months. The site is well adapted for the purpose, and has been laid out in a way that enhances the beauty of the place. The building is light and attractive in appearance, and its high towers, rotundas, sculpture and decoration, within and without, have been generally admired. The architect of the building is M. Sallé, M.M. Aublé Chacot and Halphen are the engineers, and M. Felix Martin is the director.

## NOTES AND COMMENTS.

IN the excitement which attended the completion of the designs for the proposed War and Admiralty Offices, it is not surprising that some competitors should overlook the order which fixed St. George's Porch as the rendezvous for the cases with the strainers. But through the oversight several sets of designs were refused admission. In some instances the sufferers can hardly be blamed. It was reasonable to assume that on such an occasion the clerk's office might be kept open for a few hours longer, and that it would be safe to entrust a case to the care of a railway or other carrier. If a sufficient explanation of the delay could be offered, it would be a kindness on the part of the First Commissioner to allow the excluded designs admission. The fewer the designs the better are the chances of the timely competitors, but we are confident that the majority of them would not demur to this proposal.

THE laying of the foundation-stone of the Glasgow Municipal Buildings has been a costly affair, for the expenses have amounted to 11,150*l.* 0*s.* 7*d.*, an enormous sum to pay for a day's glorification of a Council. The platform in George Square cost 3,391*l.* 7*s.* 7*d.*, and the arches and decorations 1,154*l.* 12*s.* 11*d.* The civic and masonic procession cost 112*l.* 1*s.* 2*d.*, but the trades' procession and platform is debited with 3,427*l.* 10*s.* 3*d.*, including the platform, which cost 3,366*l.* 5*s.* The outlay on the banquet was 1,181*l.* 9*s.* 6*d.*, and on a conversation 892*l.* 4*s.* 2*d.* The sum paid for fireworks was 600*l.* Lastly, there was an outlay of 390*l.* 15*s.* in general expenses. It is sometimes difficult to understand the reasons which guide the local authorities, and the expenditure of so large a sum may have been prudent. But when it is remembered that Glasgow needs buildings for an art gallery, an art school, and a public library, it certainly seems as if the Town Council were selfishly extravagant in their disposal of the public funds.

IT is fortunate that the works of the extension of the District Railway between the Mansion House Station and the Tower do not interfere with many buildings, for the navvies appear to be allowed to do as they like. One of the most important parts of the City is the region that lies between King William Street and Eastcheap. It was necessary to remove a few houses, and those which adjoin have been kept secure by means of counterforts of the kind that is usual in brick bridges over a country road. In the latter case the counterforts are concealed, but they are allowed to be visible in the City, and foreigners may well be amazed on seeing them. Their appearance suggests that the Corporation are still as indifferent as ever to the amenity of the City. The railway contractor is hardly to be blamed for getting through his work in the most economical way when he finds that there is no officer to control him.

THE Committee of Parisian Inscriptions has decided on placing a commemorative tablet at the angle of the Rue St. Denis and the Boulevard Sébastopol, to mark the site of the Grand Châtelet, the old fortified gate of the city of Paris and head-quarters of the Prévôts and Company of Notaries.

THE next exhibition of works by the Society of Painter-Etchers will be held at the Walker Art Gallery, Liverpool, and will open on Monday, September 1. All forms of engraving on metal, whether by the burin, the etching-needle, by mezzotint or aquatint, or by whatever other process the artist may choose as a means of original expression, are understood to be included in the term "painter-etching," and are eligible for exhibition, whether the artist sending them be a Fellow of the Society or not. All works sent for exhibition are subject to the approval of the Council; a Fellow of the Society, however, is entitled (by virtue of his membership) to exhibit two works without undergoing the censorship of the Council, contributions beyond that number being subject to approval in the usual way. Works sent for exhibition must be original. In the case of any which have been published, they must be restricted to those that have been published or exhibited since the last exhibition of this Society. All works intended for exhibition must be delivered (suitably framed) between July 21 and August 2, to the London agents of the Walker Art Gallery, and no charge will be made to contributors for carriage to and from Liverpool of works thus sent. Contributors may, how-

ever, forward their works (carriage prepaid) direct to Liverpool, addressed to "The Society of Painter-Etchers, Walker Art Gallery, Liverpool," where they will be received from July 21 to August 9.

JUDGMENT would appear to have gone by default in the case of the Glasgow ironmasters. It was alleged a few weeks ago that an undue proportion of cinder had been used as a constituent of the pig iron, and the ironmasters were indignant. The simplest way to ascertain the facts would be to apply tests to specimens selected at random. But letter-writing was substituted, and it may have been the wiser plan, for the revelations of a chemist or metallurgist must have made the case appear much worse. Messrs. CONNALL & Co., who have charge of the iron in question, were asked if they were in a position to deny the allegations; their reply is candid. "We have no knowledge," they say, "of the materials with which the furnaces were charged; nor do we suppose it was part of our duty as public storekeepers to ascertain this. We have two head warehouse-keepers of great experience in the handling of pig iron, whose daily duty it is to examine iron going in, and satisfy themselves that it is of fair average quality and number according to the brand stamped on it." A more empiric way of classifying iron it would be difficult to imagine. In the absence of Messrs. CONNALL'S "knowledge," the ironmasters made an attempt at investigation, and they have discovered that, during last year, from 25 to 45 per cent. of the furnace charge consisted of cinder in so many furnaces as to represent one-sixth of the whole production. If the inquiry will be followed up we may hear that the proportion is still larger.

IN the foundations of a house recently demolished in the Rue de l'Arc-Dugras at Nîmes a fine mosaic has been discovered. It is in the form of a rectangular slab, the subject apparently being *Endymion waiting upon Diana*. The shepherd is portrayed in dreamy repose at the foot of a tree, with a cupid hovering above and a dog lying asleep at his side. The inlaying is much finer than that of the ordinary *tessalata* found two months ago in the Rue St. Batilde of the same city, and the slab measures about 4½ feet square.

THE cost of the Market Hall of Burton-on-Trent has far exceeded the estimate. On the buildings and works the sum of 14,843*l.* has been expended, and the charges for architect and clerk of works bring the sum up to 15,783*l.* The site has cost 3,201*l.* The sum borrowed was 11,270*l.*, which was supposed to cover cost of building and site. An additional expense amounting to over 7,000*l.* has been incurred in connection with the building works. The opinion of the rate-payers and of the Local Government Board upon so large an addition has yet to be ascertained.

IT is expected that the Exhibition of Works in Wood will be opened in the new hall of the Carpenters' Company, about the middle of May. The two companies of the Carpenters and the Joiners have determined to invite British workmen generally to compete in the several branches of these crafts, and have offered a number of prizes, details of which can be had by application to the clerk of the Carpenters' Company. The number of responses received warrants the belief that there will be a good collection of articles of interest, of which a large number will be made for the occasion. It is also proposed to form a museum of every kind of illustration of both carpentry and joinery. The committee will be much gratified by receiving, merely for the purpose of exhibition, any models of drawings of existing or ancient works in wood, which would be of interest in showing the kind of work done both in the olden and the modern times. The exhibition will continue open for about three weeks, from eleven o'clock in the morning till five o'clock in the evening on four days in the week, and till nine o'clock on Wednesdays and Saturdays.

AT the solicitation of the Deputies and Town Councillors of the Gros-Caillou and neighbouring quarters, the Prefect of the Seine, in accord with the Minister of War, has granted leave for the creation of a racecourse on the Champ-de-Mars. The opening day, to be attended by the Prefect in person, is promised for next month, and the races will be held on Mondays and Saturdays.

## ILLUSTRATIONS.

COLLYERS, NEAR PETERSFIELD, HANTS.

THIS house, built for the late Lieutenant-Colonel SHUTTLEWORTH, is constructed for the most part of hollow brick walls, with rough-cast; but the front door gable (not shown) to the east is of best facing bricks, with Shawk stone dressings and sculptures. With the exception of the moulded bricks in the chimney shafts there is no manufactured ornament whatever; all is executed by hand.

The view given in our illustration is that of the south garden front, and shows—on the ground floor—the windows of drawing-room (on right), the verandah in front of the inner (and furnished) hall, and the library, which has windows also to the west.

The house contains five living-rooms, eighteen bedrooms, besides bath-room, &c., &c. The house is well situated, being sheltered from north and west, and commands fine views to south and east. It stands  $1\frac{1}{2}$  miles from Petersfield. The architects are Messrs. BATEMAN & KEATES, of 12 Nottingham Street, W.; the contractors, Messrs. JOHN CROOK & SONS, of Northam, Southampton; and the quantities by Mr. PETHER, of Essex Street, Strand.

The illustration is taken from a drawing which appeared in the last exhibition of the Royal Academy.

PARK HOUSE, SUTTON.

THE alterations to this building are being carried out from the designs of Mr. HERBERT D. APPLETON, A.R.I.B.A., of 157 Wool Exchange, Coleman Street. The walls are of dressed flints, with Douling stone dressings, and in some parts cut brick dressings. The dining-room has an oak ceiling. Mr. W. SMITH, of Eldon Works, Kennington, is the contractor, and Mr. J. COLEMAN clerk of works.

STABLES AT ASHBURN MEWS, SOUTH KENSINGTON.

THE stables shown in the illustration at Ashburn Mews, Gloucester Road, South Kensington, were erected last year from the designs of Mr. ARTHUR CAUSTON, architect, 9 Spring Gardens, S.W.

TEA-ROOM, ZOOLOGICAL GARDENS, LIVERPOOL.

THE illustration shows one half only of the restaurant block. The duplicate half extending west will comprise the restaurant proper and dining-hall, with cloak-rooms, service apartment, &c. The semi-quadrangle in front of these rooms will be planted with lindens in symmetrical order to form a sylvan promenade for *al fresco* concerts. The section illustrated contains the extensive tea-rooms for visitors, and the spacious hall for concerts, dramatic and other performances, public meetings, and use of the terpsichorean art. The sides of the room are fitted up as alcoves upon a dais, with a promenade gallery overhead communicating with an external balcony on the same level. All the highest points of the various structures will be illuminated by electricity.

This structure, like the other buildings in the gardens, will be carried out from the designs of Messrs. W. SUGDEN & SON, Leek.

CONTINENTAL SKETCHES.

THIS page is a companion to one lately published, which was also reproduced from sketches by Mr. T. BUTLER WILSON, of Leeds.

SKETCHES OF OLD HOUSES.

WE publish two sketches by Mr. F. W. FRANKLIN CROSS, the secretary of the Birmingham Architectural Association.

The house at Alvechurch, Worcestershire, is one of the many bits of half-timber work with which Worcestershire abounds. It stands on the declivity of a steep hill leading to the church, and it is a truly characteristic specimen of old Worcestershire.

Northamptonshire is rich in specimens of buildings of this style and date; but out of a folio of sketches made some years since, this one of the Talbot at Oundle has been chosen as one of the best, and admirably expressing its purpose. It is built of stone, and is covered with a thick grey slate, like many other buildings in Northamptonshire.

THE STANDARD LIFE ASSURANCE COMPANY'S BUILDINGS.

THE new building, of which we gave an illustration in last week's number, will shortly be in course of erection in King Street and Pall Mall, Manchester. The building is designed in the French Gothic style, the two principal elevations shown being constructed entirely of stone, the base being formed of dark polished Shap granite, and the external steps in Castlwellan granite, with polished risers and nosings. The roof is to be tiled, the windows filled in where shown with ornamental lead lights. The joiner's fittings on the ground floor will be executed in American walnut with ebonised mouldings, the ceilings being panelled in pitch pine, stained and varnished. Messrs. CLEGG, SON & KNOWLES are the architects, and Messrs. ROBERT NEILL & SONS the contractors for the works, which are to be completed in fifteen months from date of contract, at a cost of 9,989*l*.

## MR. LESSELS'S PICTURES.

THE fine art collection of the late Mr. John Lessels, architect, was brought to the hammer on Saturday in Dowell's rooms, Edinburgh. The most important pictures in the collection, which included a large representation of the late H. W. Williams—"Grecian Williams"—were two very fine water-colour drawings by J. M. W. Turner, R.A., both well known through engravings. One of these was *A View of the Rialto*,  $8\frac{1}{2}$  by  $5\frac{1}{2}$  inches, and the other *Berwick-on-Tweed*, 6 by  $3\frac{1}{2}$  inches. Both are beautiful examples of the refined art of the great colourist. The *Rialto* was started at 100 guineas and went up by fives to 225 guineas, at which figure it was knocked down to a Glasgow dealer. *Berwick-on-Tweed* began at 20 guineas, and was bought by an Edinburgh gentleman at 190 guineas. There was a third drawing by Turner—*A Scene in Warwickshire*— $7\frac{1}{4}$  by  $5\frac{1}{4}$  inches, but this being only a study and unsigned, went for 23 guineas. The following among other pictures were also sold:—

*Italian Street Scene*, by J. Holland, 26*l*. 5*s*.; *On the Esk—Painted from Nature*, by E. T. Crawford, R.S.A., 38*l*. 17*s*.; *On the Devonshire Coast*, by T. M. Richardson, 15*l*. 15*s*.; *Mountain Scenery*, by J. B. Pyne, 17*l*. 6*s*. 6*d*.; *Murano, in the Gulf of Venice, with a Prospect of the Friuli Mountains*, by W. L. Leitch (1847), 31*l*. 10*s*.; *View of St. Peter's, Rome, from the Borghese Palace*, by Andrew Wilson, 25*l*. 4*s*.; *View of Edinburgh from Hillside, Aberdour*, by H. W. Williams, 68*l*. 5*s*.; *Amalfi*, by J. B. Pyne, 31*l*. 10*s*.; *Castel-a-Mare*, by T. L. Rowbotham, 16*l*. 16*s*.; *Clovelly—Devonshire*, by T. M. Richardson, 21*l*.; *The Graves of the Clans*, by H. W. Williams, 15*l*. 15*s*.; *Scene in North Wales*, by T. M. Richardson, 31*l*. 10*s*.; *Cathedral Interior with Procession*, by J. Holland, 29*l*. 8*s*. A large number of works painted by Mr. Lessels himself were also disposed of. Among these was *A View on the Grand Canal, with the Church of St. Maria del Salute, Venice*, which brought 22*l*. 1*s*.

## THE GLASGOW MUSEUM AND ART GALLERIES.

THE following annual report has been presented to the Town Council:—

"Although the year 1883 had been marked by no exceptional event in the experience of the Museum and Art Galleries of Glasgow, it was satisfactory to note the report bore that these institutions continued to make steady progress, increasing in usefulness, and becoming better appreciated and more fully made use of by the public. The Italian Art Exhibition, which was opened in the Corporation Galleries at the close of 1882, was continued till the end of April. During that period it was visited by nearly 38,000 persons—a number largely in excess of that recorded in the case of the corresponding Oriental Art Exhibition of the previous year. Every facility was granted to encourage qualified art students to make full use of the collections. While the Italian Art Exhibition was in progress in the Galleries the committee experimentally organised a small local exhibition in the Bridgeton district of the city. For this exhibition the conveniently-situated hall connected with the Eastern District Police Buildings was kindly placed at their disposal by the Magistrates and Town Council. The exhibition, which was open fifty-six days, from February 20 till April 24, was exceedingly popular in the district, and was visited by 63,585 persons. The additions to the Technological and Natural History sections of the Museum were not so considerable as they have been for some previous years, although the list shows many valuable and interesting donations. In continuation of the series of annual exhibitions of decorative art the committee during the autumn took steps to organise a loan collection of French decorative art. The collection was opened to the public on December 20, with every prospect of being as well appreciated and as useful as any of its predecessors. The number of visitors to the Museum

and Galleries during the year amounted to the large total of 321,797 visitors, and adding that to the attendance at the Eastern District Temporary Exhibition, it was found that no less than 385,292 persons visited the exhibitional institutions under charge of the committee during the year. The number of qualified students to whom copying tickets for the Galleries were issued was fifty, and by such students 682 visits were paid to the Galleries for the purpose of copying from the pictures, &c. These figures show a large increase over the returns of the previous year, and this growing utilisation of the Galleries for the purposes of study was one of the most pleasing features of the recent experiences of the institution."

### REBUILDING THE BELGIAN CHAMBERS.

THE Committee of Deputies appointed to examine the plans of the architect, M. Beyart, for the reconstruction of the Belgian Chambers, have adopted them. The façades of the building will agree with the original design made in 1784. Besides many other changes in the interior, the hall of meeting of the Chamber will be considerably enlarged, and the number of available seats for the members will be increased from 144 to 175. The Chamber numbers 132 members, but periodical additions have to be made to their number in proportion to the increase of the population. The Constitution provides that every 40,000 of the population shall be represented by a member in the Chamber, and every 80,000 by a Senator. The Ministers, seven in number, will have a bench to themselves, separated from the seats of the other members. The fire having injured the large marble statue of Leopold I., which adorned the hall, a new statue of the founder of the Belgian dynasty will be placed there. The library of the Chamber will be completely separated from the rest of the buildings. The reporters' gallery will be much enlarged. All possible precautions against the danger of fire are to be taken. The cost of the new building is estimated at 3,000,000 frs., and its completion will require about two years.

### EDINBURGH ARCHITECTURAL ASSOCIATION.

THE members of the Edinburgh Architectural Association paid a visit on Saturday afternoon to three places of historical interest in the suburbs of the city. Notwithstanding the unfavourable weather, a numerous party assembled at Grange House, the property of Sir Thos. Dick Lauder, but at present leased to Mr. and Mrs. Nutt for a ladies' boarding-school. The "dog's cemetery," near the entrance gate was first visited, and a short time was spent in deciphering the epitaphs on the tombstones which mark the burial-places of some favourite specimens of the canine race. Proceeding to the mansion-house, Mr. G. Washington Browne, architect, who conducted the party, gave a few historical notes of the place. The name of "Grange" as applied to the district was, he said, derived from its having been the site of the old granary, or "grange," of St. Giles's Church. Maitland, in his history, accounted for the name by its having been the granary of the convent of St. Catherine of Sienna, now corrupted into Sciennes; but he (Mr. Browne) believed that to be an erroneous inference. Mr. Browne traced the history of the Grange, showing that the property was in the hands of the Cants up till 1607; in 1679 it came to Wm. Dick, through his marriage with Janet M'Math, and it was acquired by the Lauder family by the marriage of Miss Dick with her cousin, Sir Andrew Lauder of Fountainhall. The company were conducted through the principal apartments of the house by Mrs. Nutt, who explained the most interesting of the fine old paintings which adorn the walls. Prince Charlie visited the house in 1745, and danced with the Ladies Seton, whose portraits hang on the staircase. Among the quaint furniture, which was examined with interest, is a hall seat, the back of which is formed of what is said to have been the head of Cardinal Beaton's bed. Before leaving the house a visit was paid to the room in which Robertson, the historian, died. The company then proceeded to Craig House, which is now a convalescent home in connection with the Royal Asylum for the Insane. They were there met by Dr. Clouston, and shown over the apartments. In the course of some remarks on the building, Mr. Browne drew attention to the date, 1565, over the entrance door, with the initials "L. S. C. P." Whose those initials were, or who had built the house, he had been unable to find out, but from its structure it was evidently intended for a residence rather than a fortified place. The northern wing was presumably added in 1746, by Sir James Elphinstone, whose name was carved on a scroll over the coat of arms above the entrance door to that wing. The late John Hill Burton had his library in that wing, and is understood to have written his "History of Scotland" there, but the room has now been subdivided and modernised. The company next visited Merchiston Castle, where they were received by Dr. Rogerson. Mr. Browne said it was not quite clear whether the building was in existence before 1438, when it was in the hands of the Napiers. That it was of earlier date was supposed by the name it then bore, viz., the King's House. Whatever its date, it was certainly

built as a stronghold, the walls being very thick, one of them measuring 10½ feet. The first three Napiers were Provosts of Edinburgh, the second was Comptroller of Scotland under James II., and Ambassador to the Court of the Golden Fleece in 1473; the third founded a chaplaincy and altar to St. Salvator in St. Giles's Church in 1493; the fourth was killed at the battle of Pinkie in 1547; the fifth fell on Flodden Field; and the lineal descendant of the family was the present Lord Napier and Ettrick. The company were shown through the castle by Dr. Rogerson, and saw the room in which John Napier, the inventor of logarithms, laboured.

### THE TEACHING OF DESIGN.

THE annual meeting of the Macclesfield School of Art was held on the 4th inst. According to the report the school, in 1880, stood forty-sixth in order of success, in 1881 sixteenth, in 1882 eighth among 182 schools, and in 1883, in number of awards, it takes the seventh position out of 191 schools. In 1882 Macclesfield for the first time gained the honour of an award of a gold medal, in 1883 it has again obtained one gold medal out of the twelve awarded, and in addition five out of the fifty-eight silver, five of the 103 bronze medals, and two of the 201 book prizes awarded; in other words, thirteen out of a total of 364, or one 1-28th of the whole number. At the meeting speeches were delivered by the chairman of the school, Mr. May, Sir P. Cunliffe Owen, Mr. Scott, headmaster, and others.

Mr. Henry Birchenough, M.A., said there were many points in the report which could be touched upon. He would, however, confine himself to one or two of special interest. And, in the first place, with regard to design. That seemed to be the strongest point. The secretary had told them in his report that, taking the value and the number of designs together, the Macclesfield school stood first in England in designs. That was a very high position to have attained. Masters and students had worked under conditions which are in many respects very unfavourable. The teaching was good; they were all agreed upon that; the students were intelligent and possessed of much originality. They had only to examine the works they have executed during the past session to be convinced of that. But teaching and intelligence alone would not make designers. What was above all needed was well directed experience. And it was in affording the students the means of gaining such experience that they were weak. If asked for designs for a rich silk hanging, or for an elaborate embroidery, such as those Mr. Nicholson produced with such admirable skill, what experience had they to help them? How many of them had ever seen hangings falling in lovely folds in house or palace—how many of them had ever seen embroideries covering table or couch? The most that could be offered to them were scraps and tatters of brocades of a bygone time, which were exhibited in frames. He did not wish to disparage these; they were all they had. He was pleased to hear that the energetic master, Mr. Scott, took some of the students down to Manchester last week to see the collection of stuffs there. That was all to the good, but it clearly was not enough. It had been truly said that "Design is not the offspring of happy chance." Designs do not grow in our students' heads like cherries grow upon cherry trees. The art of designing is slowly acquired by patient observation and laborious experience, and no amount of teaching and lecturing and prize-giving would make designers of students, unless we surround them with conditions proper to their studies, and unless we offer them the best examples to follow. They all knew how ugly our workshops were with their endless monotony of blank whitewashed walls; that our streets are not beautiful, homely and pleasant as we may perhaps find them. They knew, too, how few opportunities our students have of visiting the interior of beautiful houses. And, therefore, any influence which had to be brought to bear upon them must be excited within these four walls. He did not ask them to at once turn that building into a palace. They had not the money to do it, and if they had, we should require it for more pressing needs. But he confessed he should like to see it so beautiful and adorned that the change of surroundings in passing from workshop to school might be as great as possible. He did not think that they could ever over-estimate the influence of surroundings upon art work. And, most of all, he should like to see the school endowed with a collection of the good and admirable work of the designs of past ages, and that students might be able at all times to see what had been done, and therefore what can be done, and to seek for their inspirations in the noble work of the past. Last year he was in Berlin, and visited there the Arts and Trades' Museum. It is a museum which has been founded upon the model of South Kensington by the personal efforts of the Crown Princess. He asked particularly to see the stuffs—the silks and embroideries. He was shown into a small admirably-arranged room, filled with closed cases or cupboards. The director asked him what period of design he wished to see. He said, quite haphazard, "the seventeenth century;" whereupon he opened a case and showed him more than a hundred examples of work of that period. And so with the fourteenth, fifteenth, six-

teenth, and eighteenth centuries. All the designs were arranged according to their period, so that the whole could be studied historically. He should like to see that institution endowed with some such collection as that, for they had arrived at that point in the history of the school when they did not need so much to improve the teaching or to seek for better endowed pupils, as to surround those pupils with better conditions, to offer them better models to study, and to change and refine their school life. It was clear that if we keep our designers ignorant and inexperienced, in the midst of evil surroundings, they would give us bad designs, but if we educate them and refine them, if we hold up to them the best and highest examples to follow, and point out to them the noblest ends to attain, their designs would repay us by their beauty, their originality, and their refinement.

### THE NEW OXFORD HOSPITAL.

A MEETING of the Oxford Local Board was held on the 5th inst., when it was reported that the plans for the proposed Infectious Diseases Hospital had been approved by the Local Government Board. The Committee recommended that 10,000*l.* should be borrowed, and that Mr. White, the Board's surveyor, should be employed to take out the quantities and superintend the work as architect, at a charge of 2½ per cent. on the total outlay, it being understood that the quantities be taken out at other times of the ordinary business hours, and that any assistance required by Mr. White in his capacity as architect be provided at his own cost. In order to prepare the plans with due despatch the Committee found it necessary in November 1882 to engage the services of a draughtsman, although the appointment was not reported to the Board at the time. The Chairman said that as Mr. White had had all the trouble of making the plans originally, it would be fair to put the carrying out of them in his hands, and as a matter of economy the employment of Mr. White was desirable, as it was an extremely insignificant percentage which was mentioned in the report, and the Board would be saved some hundreds of pounds on that head. Mr. Laker said the surveyor was bound to prepare plans, estimates, and specifications for any new buildings as part of his duties. He moved as an amendment that the commission of 2½ per cent. to be paid to the surveyor of the Board on the occasion of erecting a fever hospital be postponed until after the report of the Executive Committee, who have now under consideration the important changes in the surveyor's department. Mr. Embling said that when the surveyor obtained an increased salary they were told that Mr. White knew more than an ordinary surveyor, and they were to have the benefit of his knowledge. He protested against paying a man extra for work which it was his duty to carry out. On a division seven members voted for the amendment, and sixteen against it.

### THE GOTHIC REVIVAL.

THE second lecture on "The Gothic Revival" was delivered by Mr. William Morris on Monday night, at the Midland Institute, Birmingham. Having recapitulated the points of his preceding address, he spoke of the ally that came to the study of the arts in the movement in the English Church, which has since got the name of Ritualism; but which, he thought, might be put down, on the whole, as part of the general tendency to protest against the blank stupidity of the eighteenth century. Gothic art began to receive a great deal of attention, and to vindicate its title to ecclesiastical art, or Christian art, as Pugin, with little more logic, used to call it, by getting itself used as an imitative style for the building of churches—at least in England—people not seeing, as they did not altogether see to-day, the queer incongruity of building their houses in one style, and their churches in another. One luckless result of this alliance of quasi-art with quasi-theology was the mishap expressed by the word restoration, which wrought the most frightful ravages while people's ideas about, he would not say the essence, but about the mere differentia of Gothic art, were very crude indeed. There was something quite sickening to a lover of art, to think that an ancient building, a lovely piece of art in itself, the growth of the very soil of the country, the outcome of so many centuries of thought, the witness of a state of society and methods of handicraft long passed away, after having escaped so many dangers of change, and accident, and violence, and lapse of time, should be liable to sudden and violent destruction, brought on by whim arising in the head of a half-educated man, who had not grasped the fact that the workmen of to-day are in a different position to those of the Middle Ages. In the next act of the revival it began to be perceived that the style was founded on principles, that it had a life and spirit in it, and, as a matter of course, that it was adapted, not only for ecclesiastical buildings, but for all buildings. This perception was helped on by the growing study of foreign Gothic and kindred styles, especially by the study of the architecture of Italy, guided by Ruskin's unrivalled eloquence and wonderful ethical instinct. The subject was considered scientific-

cally, and people formed the hope of founding a new style of architecture on the vigorous organic period of Gothic. Even in this act, however, the foe Restoration came in, and men, in their enthusiasm for purity of style, saw nothing worthy of preservation after the fourteenth century, and destroyed later work which no age of the world could have afforded to lose, supplanting it by feeble copies of earlier work. With the third act of revival came greater and more intimate knowledge of the art of the Gothic period, and withal a greater knowledge of the conditions of life at that time. Imaginative painting, too, benefited by this stage of the revival. Out of this third act of the revival we might be said now to have passed into the fourth, which had strengthened the hope of many people that a new style of art was forming which would be at once beautiful and fitting at the same time to the life of our own time. Strange to say, there had been amidst all this a reaction which had found expression in a return to the whimsical ghost of a style of the eighteenth century, which owed whatever was admirable in it to a survival of the Gothic times, all the rest being mere inanity and tokens of a narrow-pitched bourgeoised one. The lecturer deprecated for the present extensive ornament, because he considered it worth nothing, except done by an artist, and artist's work was, under present conditions, expensive. He described the conditions under which a mediæval craftsman worked, each man being master of his time, free to give his whole thought and imagination to his work, and in fact an artist; while the workman of the present day was, by the present competitive system, compelled to work by pattern, and could not linger over his work. Those who expected to see a living school of art amongst us must make up their minds to one thing, that their cultivation would not help it forward one whit unless it was shared by all men. And if they thought that that was an easy thing to bring about, they were wrong. The present division between upper and lower classes, rich and poor, was necessary for the existence of the present commercial capitalist system, while at the same time it entirely forbade that universal cultivation, ease, and leisure, which alone could produce popular art. But if art was not popular, it was not of the people, it was an idle and worthless toy. Therefore, the progress—nay, the very existence of art—depended on changing the basis of society. Art was not a little thing; it meant the pleasure of life. It was a question between barbarism and civilisation; nay, between progress and corruption, between humanity and brutality—he was wrong there, for the brutes were at least happy, but men without art would be unhappy.

### THE BERMUDA CATHEDRAL.

ON Sunday morning, February 27 last, Trinity Church, Bermuda, the pro-cathedral of the colony, was entirely destroyed by fire, supposed to be the work of an incendiary, as there was no heating apparatus or inflammable matter, not even lucifer matches, kept in the church. The fire was first observed by a groom who lived opposite the church. He had passed the building on his way home from some duty at a quarter past four that morning, and saw nothing amiss about the building. He went immediately to bed, when he heard a crash in the direction of the church, and when he looked out saw flames issuing from the roof and from the tower in several places. He rushed to an isolated bell-turret to give an alarm, but found the bell ropes cut, and on running to rouse the sexton who lived near, he encountered a "white man" without his hat, who asked him why he did not save the books. The "white man" was running from the church, and immediately disappeared. No human effort could then have saved the building. The whole of the woodwork was consumed in two hours. The remains of the walls are shattered in many places. The fire is supposed to be the work of an American Fenian, or of some Puritanical bigot. The building was a very handsome edifice, in the Early English style of Gothic architecture, built of the fine white coral stone of the islands. It was completed about twenty years ago from plans by Mr. William Hay, architect, Edinburgh, of the firm of Hay & Henderson, 17 Hill Street (the restorer of St. Giles's Cathedral). After some fifteen years previously spent in building operations, from the difficulty chiefly of procuring skilled labour in the islands, Mr. Hay twice visited Bermuda, with the late Bishop Field of Newfoundland, to give an impetus to the work. The church consisted of a nave, eight bays in length, a large central tower, two transepts, a choir or chancel, of a total length of about 175 feet. It had north and south porches, vestry, and western entrance, deeply recessed with gabled penthouse over the arch. The gables of the nave, choir, and transept were perforated with tall lancet windows, four on the west end and three on each of the others. These and the other windows of the church were filled with valuable stained glass (chiefly memorial) by the best artists in England. The choir, or chancel, was roofed with the red cedar of the country, now scarce, and more costly than the best mahogany. The nave and transept roofs were of pitch pine. These roofs were 40 feet from the floor to the top of the clerestory wall, and it is almost incredible that fire could have reached such a height if kindled on the floor. It is supposed the organ, which

was lofty, had been used as the vehicle of communication. Active efforts are already being made to raise funds for restoring the church, and several large subscriptions have been received from the principal inhabitants of the islands. The Bishop of Newfoundland, to whose diocese Bermuda is attached, is to make an appeal to the public, which is expected to be largely responded to. The amount required will probably be from 15,000*l.* to 20,000*l.* Up to the time of the mail leaving no arrests had been made, nor does there appear to be any sufficient clue to the discovery of the perpetrator. At this season many respectable Americans visit the islands for the sake of the mild winter climate, and it would be easy for one black sheep to escape detection among so many strangers.

### THE FORESTRY EXHIBITION IN EDINBURGH.

THE Executive Committee of the International Forestry Exhibition had two questions before them at their late meeting in Edinburgh, viz., the questions of advertising and electric lighting. The reserve price for the outside page of the catalogue of the Health Exhibition, London, is placed at 1,000*l.* Last year it was leased for a sum of 500*l.* The applications for space, especially from the Colonies, come in apace, and cannot be separately noted. Their Excellencies at the head of the Colonial Governments abroad have accepted the invitation to become members of the general committee, and Baron Oscar Dickson has also consented to join. In addition to essays on various subjects connected with forestry which have been freely offered, a course of lectures by eminent professors of the science of forestry in various countries has been arranged for during the continuance of the exhibition. The committee are now in possession of the details of the contributions they may expect to receive from India. The general Government collection will embrace, first, a series of forest maps, prepared at the Forest School at Débra Dun, which show the progress that has been made in the last fifteen years in the demarcation of forest reserves and surveys of the Himalayan and other hill tracts; second, an index collection of 800 varieties of the different timber trees found in India. Besides this, each local government will contribute any remarkable forest products peculiar to their respective provinces. From the exhibition which is to be held in Travancore in April, His Highness the Maharajah proposes to pass on the collections specially pertaining to forestry. There are many specimens of Indian furniture and carved wood in this country, which the owners have intimated their willingness to send for the purposes of the exhibition; and the planters of tea, coffee, cocoa, cinchona, &c., in India and Ceylon propose to send samples of the produce of their estates. By these combined efforts we may expect that the Indian Court, the charge of which has been entrusted to a Special Commissioner, will contain a fitting representative collection of the forest wealth of our Eastern empire.

### UNIVERSITY COLLEGE, NOTTINGHAM.

AT the meeting of the Nottingham Town Council, which was held on the 3rd inst., Ald. Cropper moved the confirmation of a report from the University College (Defects) Committee upon the defects in the University College building. He said that the specifications had not been carried out. The proposition that he had to submit to them was this. Was it reasonable, was it honest, that an architect who received ample commission for the designing and erection of certain premises should be permitted to delegate his responsibility to a foreman carpenter at 30*s.* or 40*s.* per week? That was precisely what the architects had done. That was the point they asked the Council to submit to the arbitration of a competent authority. There were admissions that the plans and specifications had been varied, while the Corporation were recommended a certain stone to be used which was not suitable for a boundary-wall. They had paid for skill and supervision, and had got neither to the extent which they had a right to expect.—Mr. Fitzhugh seconded.—Mr. Young stated that the building was in such a deplorable condition that he was told that in ten years' time the building would tumble down unless something very urgent was done. He also wished to know whether the clerk of the works was not appointed by the Corporation, and whether he was not responsible to the Corporation.—Mr. Vickers said that they had a claim against the architect and not against the clerk of the works.—Mr. Bayley wanted to know what they were going to arbitrate upon. If there was to be an arbitration he thought it had better be referred not to an architect but to a civil engineer.—Mr. J. Robinson commented upon the great expense of arbitrations. He thought that they had had enough of them.—The Town Clerk said that Mr. Mawson was willing that that should go to arbitration, the assessor being an expert, and that there should be no counsel or solicitors, and that the whole thing should be done as cheaply as possible.—Ald. Goldschmidt objected to members of the Council trying to force the hands of the committee in such a delicate matter as that.—Mr. Jacoby said that it was shocking, after having paid 75,000*l.* on that building, that it should be found defective already. There was blame somewhere, and the only way to find

that out was by arbitration.—Mr. Walker was of opinion that the clerk of the works was their own servant, and the verdict would be against them.—Mr. Gregory, Ald. Dennett, and Mr. Renals also spoke, while Mr. Fraser said that if the Corporation had not a strong case they had better let the matter drop at once.—Mr. Browne said that all the objections raised that morning had been discussed in committee.—Mr. McCraith and Mr. Brewster also referred to the report, the latter observing that they should arbitrate on the question of amount only.—The report of the committee, after the reply of Ald. Cropper, was unanimously adopted.

### INTERNATIONAL HEALTH EXHIBITION.

THE Council of the Society of Arts announce that they are prepared to award the following prizes in connection with the International Health Exhibition:—Under the John Stock Trust, a Society's Gold Medal or 20*l.* for the best example of sanitary architectural construction, Classes 20, 28, 29, 30, 32. Under the Shaw Trust, a Society's Gold Medal or 20*l.* for the most deserving exhibit in Classes 41, 42, 43, and 45 (relating to Industrial Hygiene). Under the North London Exhibition Trust, a Society's Gold Medal or 20*l.* for the best set of specimens illustrating the handicraft teaching in any school, Classes 49 and 50. Under the Fothergill Trust, Two Gold Medals (or two sums of 20*l.*), one for the best exhibit in Class 27 (Fire Prevention Apparatus), and one for the best exhibit in Class 26 (Lighting Apparatus). From the Trevelyan Prize Fund, Five Gold Medals (or five sums of 20*l.*) for the best exhibit in each of the following Classes—2, 3, 6, 7, and 11 (all comprised within Group 1, "Food"). Each prize will be a Gold Medal, or the sum of 20*l.*, at the option of the recipient. The Council propose to ask the juries in each class to recommend for their consideration either two or three exhibits which they might consider deserving a prize.

### SOME NINETEENTH-CENTURY ARCHITECTS.\*

By PROFESSOR T. ROGER SMITH.

(Concluded from page 157.)

*George Edmund Street.*

THE name of George Edmund Street is one which it is quite impossible to omit, but which I feel I can only deal with in a very general and incomplete manner, so comparatively recent is the date of his decease.

Mr. Street—who was first known as assisting Sir Gilbert Scott in his work—when he began practice on his own account, owed a good deal of his early success, as has always been understood, to the friendship of the late Bishop Wilberforce, then Bishop of Oxford, who appreciated his talents and his energy. The Bishop himself gave him commissions and the post of diocesan architect, and introduced him to work in the diocese. Street soon became known both by his buildings and his draughtsmanship, and it is probable that the wonderful pen-and-ink drawings from his own hand, which he exhibited year after year at the Royal Academy, did not a little to increase his practice; they certainly extended his reputation among architects, and they were mainly instrumental in bringing about the revolution in draughtsmanship which has been witnessed during the last twenty years, and which the invention of photolithography has stimulated. Formerly an exhibition drawing was almost invariably a carefully-prepared outline; coloured very often by a different hand to that of the outliner, and sometimes, one must admit, tinted without too much regard either to truth or to architectural propriety. Street introduced, or if he did not introduce, he was one of the first to adopt, pen-and-ink etched drawings, outline, features, and shading all done by one hand at one time; and he succeeded in imparting to this work a sweetness and evenness of tone and a charm of touch that no other artist has equalled. These drawings seemed often to have been done with a liquid writing-ink of a slightly blue tone, and on a paper with a hard surface. They all bore marks of rapid execution, sometimes of haste; but the drawing of the features was rarely, if ever, distorted, and the air of ease and perfect mastery of the subject, and of the materials, which they displayed, reflected truly enough the conditions under which they were produced.

Street was very faithful in his adherence to pointed architecture, and very successful in adapting it to simple buildings. His small parish churches, and his plainer monastic buildings, built under circumstances where outlay had to be restricted, are full of genuine mediæval simplicity; and no one knew better how to raise a structure from the level of a mere barn to that of an interesting domestic building by the skilful use of a few well-designed mouldings, and the addition of one or two charming pieces of tracery introduced exactly where every touch would tell most. His more ambitious works were successful also; but so far as I have had

\* A Paper read at a meeting of the Leeds Society of Architects.

opportunities of judging it has seemed to me that it was in his simple buildings that he stood unapproached.

Street was an enthusiastic student of his art. The books which he published—"The Brick and Marble Architecture of Italy" and his volume on "The Gothic Architecture of Spain"—both bear witness to this. Few books exist that are better models of what an architect's note-book on a tour of study ought to be; and there is at least one excellent paper among the Transactions of the Institute of Architects, giving an account of the architecture of Auvergne, in Central France, which I well remember hearing him read. It gives an admirable summary of the peculiarities of that interesting region, and it was illustrated by a wonderful series of sketches, the dates on which showed that he must have been extraordinarily rapid as a sketcher.

Street was a man of great energy and unusual self-reliance. His method of working, as is well known, was to put everything in pencil himself, employing his assistants to ink in and colour, or to repeat features of which he fixed the form, and this he adhered to down to his death. The consequence of this, of course, was that all his work is marked by his own peculiarities and qualities to a greater extent than that of most men; but, at the same time, an amount of labour and wear and tear was entailed of which some might have been spared, nor is it too much to say that this method of work helped to kill him before his time.

Street is, of course, best known as the architect of the Law Courts, and in this building the powers of the architect were more severely tried, and a greater opportunity was left open for his ability, than in the case of any other architect whom we have had to mention, with the single exception of Sir Charles Barry. It is too soon yet to anticipate the verdict of the mature judgment of Englishmen generally on the Palace of Justice; but so much has been said against it in some quarters that, without attempting to pass a critical opinion on the building, I may be permitted to point out one or two matters connected with it. The general disposition, which is naturally the first thing that strikes us, is far more the child of the Commission who prepared the scheme for the concentration than of the architect. It should always be borne in mind that in no competition have the requirements been more minutely set forth than in the one which resulted in Street's design being adopted; and the system of isolation, which has been arranged so as to the utmost extent to cut off the judges, the bar, the solicitors, the witnesses, and the general public from one another, is the result of the deliberate judgment of the Commission. It has been a good deal objected to; but it is so different from the unseemly jumbling up of everybody which was witnessed in Westminster Hall that its true effect cannot be appreciated at once, and it will probably be found in the long run advantageous. A more serious ground of complaint arises from the difficulty of reaching different departments; but this is largely due to the fact that far too much accommodation is compressed on to the site for it to be possible that it should be accessible without numerous staircases. Probably the most efficient and serviceable public building in London is the Bank of England, where all the departments are on one level, and where there is hardly such a thing as a staircase or an upper floor accessible to the public. Had sufficient money been spent to enable the architect to spread the courts and their appendages over the whole of the site that has been cleared, instead of concentrating them as has been done, the most serious defects alleged against the structure for business purposes, including in places a want of light, would have to a great extent been obviated.

Of the exterior, which all of you can see for yourselves when you visit London, you are all competent to form a judgment, though I should like to point out that it invites and deserves long and patient scrutiny; but I cannot forbear reminding you, as architects, of the interior, which some of you may not visit, especially the unrivalled vaulted hall, the like of which does not exist in Europe; of the endless variety introduced into the features and roofing of the different courts; of the beauty of the lead lights, carving, metal-work, and other decorative accessories; and of the great variety to be met with in the mouldings, capitals, spandrels, strings, and other such features—a variety obtained without any loss of harmony. I ought also to point out what every experienced architect may verify for himself: the economy, I had almost said parsimony, with which such finishings as can be spared—such as skirtings, linings, &c.—are avoided in the plain parts of the building, though good material, and durable, is employed throughout; and the liberality with which, in those parts intended to be rich—as, for example, the courts and the hall—both materials and workmanship are freely employed. I should like also to bespeak your attention to the staircases, picturesque and ingenious; the great *flèche*, which is by far the finest modern structure of this sort of modern work in England; and especially to the variety and beauty of the vaulting. This mode of roofing dignifies a building more than any other, and in vaulting this great hall Street has done more to render the whole structure monumental than anything else could have accomplished. The vaulting is not, however, confined to the hall, but in many of the corridors and lobbies fine specimens of vaulted construction are to be found, such as it is a pleasure to examine.

The architect of this great work was, as you all know, a

member of the Royal Academy and President of our Institute at the time of his lamented death. Street was personally a man of commanding appearance, strongly built, and with an air of vigour and power; he was undoubtedly a leading spirit, and was lost to architecture at a time when his friends hoped that many years of active life, with all the weight of his great influence, might still be left him in which to pursue the profession he loved.

#### *William Burges.*

William Burges was one of the greatest artists and best antiquaries whom the Gothic revival produced. He had educated himself with great care and thoroughness for the practice of his profession; he had travelled far and wide; he knew probably as much of mediæval archæology as any Englishman of his day; he acquired a thorough knowledge of jewellers', goldsmiths', and metal-workers' work, of decoration, stained glass, sculpture, and, in short, of every art or appliance that could contribute to the excellence of a building; he sketched much and measured more, and he had a fertility of invention and a power of design which few have surpassed.

His first great success was won by competitive designs which he and Mr. Clutton sent in jointly for the Cathedral at Lille. These were extremely fine, but probably might not have been successful had not pains been taken to write to them and figure them in French and in French handwriting. The competitors took them over to France, carefully removing all English marks and labels from the package, and the result of these precautions was that, till the adjudication had been made and the envelopes with the names opened, no one had a suspicion that the architect was not a Frenchman. I believe it was from this set of drawings that M. Didron selected a design by Burges to engrave and publish, as being one of the most complete and correct examples of Christian iconography which he could put before the readers of the archæological journal that he issued. Messrs. Clutton and Burges were not, however, so fortunate as Mr. Scott was at Hamburgh; they could not get the cathedral to build, and had to content themselves with the premium.

Work did not at first come in fast, though Mr. Burges's name and fame as an artist gained a great repute. He obtained the first premium in the competition for a memorial church at Constantinople, but difficulties rose about the execution of the building, and this success brought more honour than profit. He executed, however, a good deal of work of importance, such as Cork Cathedral, the Bombay School of Art, the restoration of Cardiff Castle, and of Waltham Abbey, and several churches of great beauty and fine character. The stained glass that he did was probably the finest that has been done, as he spared no pains either to himself or the glass-painter during the execution of it. Those who know his windows at Waltham Abbey, or in the chapel of Worcester College, can bear out these remarks. Much of his time and skill was, however, spent upon small articles such as pastoral staves, cups, cabinets and the like.

He was chosen, and rightly chosen, as the best known colourist to design decorations for St. Paul's Cathedral, but the committee had not the courage to carry out his proposals when they got them, and to his great disappointment nothing was done.

William Burges was a strongly-marked personality. He was beloved by many attached friends, and probably no one came into contact with him without being interested and attracted by his strange mixture of fun and earnest, of eccentricity and genius, of work and play. He worked hard and well, but he had an innate cheerfulness that seemed never to flag, and he took and liked to show an interest in many matters which others would consider comparatively trivial. The decoration of his own rooms and furniture, and the collecting and resetting of crystals, gems, cameos, and other such curiosities, as well as armour and other antiquities, was an occupation to which he gave up much time, and in which he seemed to take the most lively interest. As a companion he was bright, cheerful, full of life; but were a matter of art or archæology started, he would pass, without a pause, from playful fun to the soundest criticism, the most enthusiastic admiration of what is excellent, the most learned, and withal, most accurate statement of the archæology of the subject. Burges was below middle height and rather sturdy in figure; he had a bright eye, a frank manner, and a hearty laugh; but no one who looked attentively at him could fail to notice the massive, well-shaped head, and the broad, powerful brow which indicated surely enough that intellectual power of which, though strangers often were not at first led to suspect it, none of his friends were unaware.

I have spoken of Burges's friends; they were numerous and they were with reason attached. He was a man who could do the kindest acts, and would do them in the most unobtrusive fashion; and the cordial remembrance in which his genial cheerfulness is still held is still mixed with deeper feelings of regret for his loss.

Burges's work was vigorous and massive, and when it erred it was rather on the side of excess of strength and heaviness. His favourite style was twelfth-century Gothic. The best known, and perhaps the best, specimen of his powers of design is the set of plans which he submitted for the Law Courts. The Strand front

of that project exercised a remarkable influence upon the works of contemporary architects, and copies of it, or at least suggestions inspired by it, were frequently to be seen after it had been published.

His decorative work at Cardiff Castle and elsewhere can, of course, be only judged by those who have had an opportunity of seeing it; but his design for St. Paul's, which was exhibited at the Royal Academy, first unfortunately in the form of a decorated model only, and a year later in a splendid set of views, may be known to many, and showed great power and resource and vigorous handling. Burges had only just been elected an Associate of the Royal Academy at the time of his comparatively early and very unexpected decease.

In leaving this little group of personal sketches we ought, I think, to carry away a strong sense of respect for the memory of these men. No one can so well judge as the members of an architectural society like this of the amount of studious preparation for active life, and the constant, unwearied, and strenuous exertion of all a man's powers and gifts, natural or acquired, which was involved in the case of each individual who has been named, in order to enable him to reach the position he attained and worthily to discharge his duties.

Such examples are a stimulus and an encouragement to ourselves in our own work; and a glimpse at a group of them, thrown together even in this fragmentary, imperfect manner, will, I hope, send us all home proud of the profession to which we belong, and of the many distinguished men who have maintained and extended its honour.

### THE MANCHESTER SHIP CANAL.

THE Manchester Ship Canal Bill came before a Select Committee of the House of Lords on Tuesday, the Duke of Richmond and Gordon presiding. The Bill seeks for powers to authorise the construction of a canal suitable for the accommodation of vessels of the greatest tonnage, and by means of which such vessels will be able to reach Manchester. The channel of the Mersey from Garston to Runcorn is to be rendered navigable, and will form the means of access to the canal. At Runcorn the canal will begin, and it is to be carried a distance of  $21\frac{1}{2}$  miles to Manchester. The low-water channel is to have a minimum depth of 12 feet, and a maximum depth at spring tides of 40 feet; while the depth of the canal is to be 26 feet, or within a few inches of that of the Suez Canal. The estimated cost of the canal works, making the usual allowance of 10 per cent. for contingencies, is 3,920,171*l.*; for the works in the estuary of the River Mersey, 1,390,419*l.*; for the docks at Manchester and Warrington, 1,121,262*l.*; for deviation of railways, 456,172*l.*; and for new roads, 16,162*l.*; total, 6,904,186*l.* The capital of the company is to be 8,000,000*l.*, and power is taken to borrow on mortgage a further sum of 2,000,000*l.* It is provided under the Bill that if at any future time it should be proposed to vest the undertaking in some public body the company shall not meet such a scheme with opposition. The scheme was introduced into Parliament last year, and, after having narrowly escaped shipwreck on Standing Orders, it was passed by a Select Committee of the House of Commons, but after full discussion before a Committee of the Upper House it was rejected by them in the month of August last. The present Bill differs but immaterially from the project originally presented to Parliament last year; but it contains powers with regard to the low-water channel, of which the 1883 scheme was divested by the Standing Orders Committee. There are 26 petitions against the Bill, but of these appearances have only entered in respect of eight, including the London and North-Western Railway Company, the Corporations of Liverpool and Birkenhead, the Mersey and Irwell Navigation Commissioners, and the Mersey Docks and Harbour Board.

### PICTURE DEALING.

AT the Lambeth County Court, on Tuesday, Mr. J. Pitt Taylor, the Judge, heard a case in which Mr. H. G. Roberts, a dealer in works of art, sued Messrs. Storer & Co., auctioneers, to recover 12*l.* damages sustained by him through non-delivery of a picture. The plaintiff stated that on the 4th ult. he attended a sale at the defendants' and purchased a picture for 25*s.*, paying 5*s.* deposit. Prior to the sale, he carefully examined the work, and found it to be an oil painting by Sartorius, at least seventy years old, and worth 15*l.* or 20*l.* On the morning after the sale he went to the defendants' warehouse for the picture, and was told that he could not have it, as some one had already obtained it by using his name and paying the balance of the purchase money. He then began these proceedings. James Knowles, a picture dealer, stated that the plaintiff bought the picture in a "knock out," and the full value was bid for it. It was not one of Sartorius's, and ought not to be mentioned in the same breath. The landscape was certainly very good, but the dogs were badly done, and one horse appeared more like a child's rocking-horse than a noble animal on

the field. The execution of the figures was hard and crude. The Judge.—If the picture was only worth what was bid for it, what reason was there for a "knock out?" The witness.—I wanted to share in one. We all have to live, you know, and the picture might have been made to sell for more. The Judge.—What, with the bad dogs and the rocking-horse? The witness.—Well, the horses could have been softened down by a good painter and the dogs touched up. It could be put in a new frame. I draw the line at putting a good name on it. In fact, I could not do that; it requires a particular touch with the brush. The Judge.—Are names put on by you picture dealers? The witness.—I am sorry to say they are. The Judge.—You draw the line at forgery? The witness.—Yes. The Judge said the defendants had been negligent. He could not doubt that the plaintiff had got a bargain, and the very lowest sum he could award him was 4*l.* and the costs of solicitor and witnesses.

### POISONOUS PIGMENTS.

A LECTURE was delivered on Monday before the members of the Leeds Architectural Association by Mr. J. C. Wright, surgeon, on "Some of the Evils arising from Household Decoration." Mr. J. W. Connon, F.R.I.B.A., presided. The lecturer said that the necessity for an intimate relationship between doctors and architects became daily more pressing. The law might help both by imposing certain restrictions which at present were conspicuous by their absence. Speaking of the evils arising from some forms of household decoration, he dealt principally with the subject of the contamination of mural decorations with poisonous pigments. He showed that wall papers, wall washes, and distempers, might be so impregnated with arsenic as to cause serious illness, and even death. Colour was no guide, and arsenic was used in colours for which it was not required. He exhibited specimens of wall-papers on which beautiful colours with good body, permanency, and brilliancy might be produced equally well without arsenic. If the colour produced was free from arsenic, there were still further dangers to guard against. In the printing of papers the colour was mixed with size which contained to a certain extent fatty matters, which would decompose. He mentioned that the proportion of arsenic in some papers might be very large, even as much as forty or fifty grains to the square foot, thus indicating the serious results which might ensue. He pointed out the effects of arsenical colours upon the constitution, and said that not only had illness but death ensued from them. The lecturer also referred to the evil resulting from a kind of green wash which was put upon the wall. A wash of this kind had proved fatal to one of his patients only a few years ago. Bed curtains, and more especially green muslin curtains, had been found to be contaminated, and calicoes, carpets, and dresses had been known to be loaded with arsenic. He complained of the want of restrictions in the sale of arsenic, mentioning that the Sale of Poisons Act only bore upon arsenic as solid arsenic, and not upon arsenic in colours. He urged that some legislation should be adopted in regard to the indiscriminate sale of arsenic.

### THE EIGHT FEET BASIS IN SCHOOLS.

A DEPUTATION lately waited on Mr. Mundella in order to advocate the necessity of retrenchment in the expenditure of the School Boards. One of the suggestions was that the Education Department should be satisfied with an area of eight square feet for each child in Board Schools. Mr. Mundella in reply, said that the voluntary schools would not allow their buildings to be filled up to the eight square feet basis. Was not the suggestion impracticable, ruinous to health, and likely, if carried into effect, to break down the whole system by ruining the health of both scholars and teachers? In all the best voluntary schools of the present time they would not have less than ten square feet, and he was convinced that the eight square feet basis would be ruinous alike to health and education, and it would be utterly impossible to enforce the eight feet basis on the London School Board. The eight square feet basis had been made the *minimum*, and if any Board went the least below it, the grant would be at once refused. What the deputation wanted now was for the Education Department to make the *minimum* the *maximum*, and force children into school upon an eight square feet basis. Returning to the question of the eight square feet basis, Mr. Mundella said ever since he had been in the department the officials had urged him to declare that the ten square feet should be the *minimum* instead of eight. He had refused, because he knew there were many poor districts in the country where such an alteration would oblige school managers to provide fresh accommodation. He had not refused because he was not satisfied that it was not the right thing to do, but he felt that it was better to let the eight square feet schools die out. He should certainly never give his sanction to any more schools being built upon that basis.

### Another Competition "Sell."

SIR,—The Guardians of the Knighton Union in Radnor have had a competition for rebuilding the workhouse, and have certainly settled the matter without loss of time, as will be seen from the following facts, which can be vouched for.

The plans were to be in by February 21, on which day the Building Committee met to consider them, and after three or four hours discussion adjourned until February 28, giving orders that *no one was to see the plans until the next meeting.*

On February 28 the Committee and whole Board met, when the Committee voted on the plans, giving a decided majority to the plans marked "A," and the question was then put to the whole Board, who ignored the Committee's preference and gave the work to a local competitor, whose plans, marked "B," were inferior to several others, and which are unlikely to pass the Local Government architect.

This ought to be a lesson to architects, for the selection was made by the Committee out of nine sets of plans after about *six hours discussion* at their two meetings, and their opinion was again upset by the whole Board (many of whom had never looked at the plans) *on the same day.*—I am, &c.

A COMPETITOR.

### Competitions Memorial.

SIR,—Will you allow us through your paper to inform the profession that, as far as names and addresses of architects practising in the United Kingdom can be obtained from the latest sources, the circular and form enclosed (and which, we trust, you will find space to print in its entirety) have been sent. It is impossible to obtain a complete list of architects in practice, but if any gentlemen should not receive a copy in the course of a few days, and will apply to us, we shall be most happy to forward one, and any further copies required.

We are, sir, yours obediently,

COLE A. ADAMS,  
ASTON WEBB,

Hon. Secs. of the Comp. Mem. Com.

[ 14 Holden Terrace, Grosvenor Gardens :  
March 15, 1884.

(Circular Enclosed.)

Dear Sir,—We have to inform you that the competitions memorial committee, appointed by the council of the Royal Institute of British Architects, to carry out the objects of the memorial presented to the President and Council of the Institute on May 24, 1880, by the late Mr. Street, on the subject of public architectural competitions (a copy of which, with the list of those who signed it, is herewith enclosed) are now making an appeal to all the members of the profession asking them to give in formally their adhesion to the principle, namely:—That they will not take part in any public architectural competitions unless one or more professional assessors of established reputation are appointed to advise the promoters on the relative merits of the designs submitted in the competition. The large number who signed that memorial, proves, we think, how very generally the principle contained in it was accepted.

We are, therefore, to ask you, *should you see no objection,\** to kindly fill up the form attached to this circular, and return it to us at your earliest convenience.

By signing the form you do not thereby express any opinion upon the desirability or otherwise of the competition system, but simply that, if it is to exist, it should be upon the principle maintained by the memorial; and whether you are in the habit of competing or not, by signing this form you will do much to insure fairness to those who do compete, as the larger the list is the greater will its influence be upon the promoters of any intended competition, and the greater will be the benefits to the public and the profession at large, as some guarantee will be gained against inappropriate buildings being erected, wasteful expenditure incurred, and undue influence exercised.

By adding your name to the list you incur no legal or pecuniary liabilities, the obligation being purely a moral one, nor are you thereby prevented taking part in any private or invited limited competition, where no assessor is appointed; and should you at any time wish to withdraw your name from this undertaking, it will only be necessary to give three months' notice in writing to that effect to the honorary secretaries for the time being of the competitions memorial committee.

It will be the duty of the committee, on receiving notice of any intended competition, to send a copy of the undertaking and a list of those supporting it to the promoters; and if you will allow your name to be added to this list, you will further the objects of the committee by acquainting the honorary secretaries with the earliest intimation of any intended competition for the above purpose, and we shall be happy at any time to avail ourselves of your assistance in this matter, and to forward you copies of these communications, &c., upon application.

We venture to hope you will recognise the justice of the point contended for, as, if the competition system is adopted for the purpose of procuring designs for buildings, it is only fair and just to the competitors

\* In the circulars sent to memorialists (some 1,400) in place of the words printed in italics are the words, "as one who signed that memorial."

that the merits of their work should be advised upon by those best competent to do so—men placed in a responsible position, and above the influences which, with every desire to act fairly, too often beset a committee composed of laymen, who cannot besides be expected to possess the requisite skill to decide upon the rival merits of designs and their probable cost. Experience shows that committees left to themselves are too likely to be taken by showy drawings and fallacious estimates, and that designs are very frequently chosen which involve all parties concerned in trouble, whereby scandals arise and the reputation of the profession is injured.

The appointment of a professional assessor or assessors for public architectural competitions may not be the cure for all the evils which attend upon the competition system, but it is surely likely to bring about a more satisfactory result, and to induce greater confidence in the public and the profession.

In any case, a reply at your earliest convenience is particularly requested.

We are, dear sir, yours faithfully,

COLE A. ADAMS, }  
ASTON WEBB, } Honorary Secretaries.

### LEGAL.

#### Court of Session, Edinburgh.—March 6.

WM. CAMPBELL MUIR v. B. P. STOCKMAN.  
ELECTRIC LIGHTING.

The defendant is proprietor of the estate of Inistrypich, Argyllshire, and he was sued by the plaintiff, a civil engineer 3 Poets' Corner, London, for 319*l.* 15*s.* The plaintiff undertook by contract in writing to fit up the defendant's house in Argyllshire with an instalment necessary for lighting the house with electric incandescent lamps. After the work had been completed the lamps were used; but after a short trial the lighting apparatus broke down, and the defendant refused payment of the account on two grounds—(1) because the contract was unsufficiently or unskilfully executed, and (2) because the account rendered is not in conformity with the contract.

The Lord Ordinary, after evidence, decided against the defendant, and found the plaintiff entitled to expenses. His Lordship said the plaintiff was not responsible for the result of the work complained of—(1) because the dynamo machine sent by Messrs. Siemens turned out of a lower speed than the pursuer anticipated; (2) because the plaintiff was willing that new gearing should have been ordered, and His Lordship thought this should have been done, leaving it a question who should pay for it; and (3) because he thought Mr. Muir undertook the risk of driving the machine under the disadvantageous conditions pointed out. His Lordship was of opinion that the alleged defects of the lamps was in no considerable extent attributable to defects, but was caused by irregularity in the current of electricity, and if his view was well founded, the plaintiff was not responsible for the irregularity of the steam power, because he suggested a method of correcting that irregularity, and his suggestion was not adopted. In regard to the objection to the account, His Lordship held that the work being proved to be such as the defendant contemplated, and the price being according to contract, it did not signify in what form the account was rendered. The defendant appealed against this decision, but their Lordships affirmed the judgment of the Lord Ordinary, with additional expenses.

#### Towcester County Court, Monday, March 3.

(Before Mr. W. H. COOKE, Q.C., Judge.)

HEATH v. REV. R. C. COLLINS.

This action was brought to recover 2*l.* 9*s.* 4*d.*, 4*s.* for attendance on defendant's agent, at various times, and at the office of the Lands Improvement Commissioners, and 25*l.* paid for a surveyor employed. Plaintiff stated that he was a builder. In June, 1882, he received instructions from Mr. Greville, Mr. Collins's solicitor, to prepare plans and specifications, and sent in an estimate for certain work to be done at the defendant's farm in Essex, near Bishop Stortford. He told Mr. Greville, as it was a large job, and the plans had to be submitted to the Lands Improvement Commissioners, he should have to employ a surveyor, and he did engage Mr. Mumby, of Salter's Hall Court, London. He sent in the plans and specifications (for which he paid 25*l.*) to Mr. Greville, and witness believed advertisements were inserted in the Bishop Stortford papers for tenders; but he heard nothing whatever of the matter from that time. His estimate was eleven hundred odd pounds for the work to be done. The surveyor's charge was fair—though there was a good deal of controversy between the solicitors as to the admission of this statement from the plaintiff—being based on the custom of 5 per cent. for works executed, and 2½ per cent. for unexecuted plans. Witness's own charge of 4*l.* 4*s.* was money out of pocket.—Cross-examined: He did not do the necessary work at Bishop Stortford when he was down there doing some work for Mr. Collins, and for which he had been paid; he went to see the tenant of the farm on

two or three other occasions. He admitted that Mr. Greville sent him a plan of the premises, accompanied by a letter making certain statements as to the work required to be done. Mr. Greville told him that the estimate was too high, and that a friend whom he consulted thought the proposed buildings could be put up for 200*l.* less, and that if he would send in a modified estimate it would be considered, and the plaintiff given a preference. He would swear that he spoke about employing an architect before the plans were sent in; he told Mr. Greville that he should have to pay a professional man, and, when in London, told him he was going to the architect. He admitted receiving a letter in which it was stated that three of the tenders for the buildings were under 900*l.*, and Mr. Percival said the bearing of this on the case was that, if the Court held the defendant was liable, the 20*l.* paid into Court was a reasonable payment on 2½ per cent. for the plaintiff's services.

His Honour: Now the question is, I understand, only as to whether the plaintiff is entitled to anything more than 2½ per cent. for his unaccepted plans.

Plaintiff's manager said he was at Mr. Greville's office when the defendant's agent gave Mr. Heath instructions about the work in Essex. If the plaintiff did the work he was not to be paid for the plans; on the other hand, if his estimate was not accepted, he was to be remunerated.

The case for the defendant was that Mr. Greville never instructed Mr. Heath to employ an architect, and that the 20*l.* paid into Court was ample for the work done, and all travelling expenses connected with it.—Mr. Greville stated that he acted as solicitor and agent to Mr. Collins, who held the farm in question. He denied that he authorised the engagement of a surveyor, and not until August 14, 1882, in a letter of that date, did he know that a professional gentleman was employed. Only once did he meet defendant by appointment in London with reference to the matter. The plans worked from were really not Mr. Heath's; but, having consulted Mr. Law, of Northampton, he had advised his client to pay into Court 20*l.*, a sum which, however, witness thought exorbitant. Cross-examined: He paid the builder who ultimately did the work 823*l.* as the amount of his account.—Mr. Henry Law said he was a Fellow of the Royal Institute of British Architects; had been in practice for twenty years, in partnership with his late father, and was surveyor for the county. Having looked at the plans produced, he thought 20*l.* was a proper payment for a complete tracing, but those produced were rough, and made in such a manner as he would not allow his office boy to do them. The charge would include all expenses in making the plans.

The Judge said, after hearing the evidence of Mr. Law, he was convinced that the money paid into Court was sufficient. Judgment for the defendant with costs.

## WORKS IN PROGRESS.

**Mr. E. H. Shorland**, of Manchester, has just completed the warming and ventilating throughout of the New Union Hospital, Mansfield, by means of his Manchester grates and vertical ventilating tubes, Mr. R. F. Vallance, of Mansfield, being the architect.

**The Sanitary Paint Co.**, of 51 South Castle Street, Liverpool, have been awarded the gold medal of the Calcutta Exhibition for their "Griffiths patent white, enamel, and other paints, colours, varnishes, &c." These various productions will be exhibited from March 24 to April 5 at the Building Exhibition, Agricultural Hall, London.

**Messrs. Suffling & Co.**, 143 Edgware Road, have just commenced the memorial window to the memory of the late Lord Castletown. It is of the Decorated style of architecture, and is in four openings, containing respectively figures almost life-size of *St. Peter, Our Saviour, St. Paul*, and *St. James*, surmounted by lofty canopies. The whole when finished will form the east window of Grafton Church, Northamptonshire. The colouring, while being in the draperies, &c., very rich, is still subdued, and forms a deeply coloured picture in a white and golden setting.

**Messrs. Diespeker & Co.**, 40 Holborn Viaduct, have lately completed the mosaic flooring in the following buildings:—Delph Reform Club, Mr. Alexander Banks, architect, Oldham; London and Provincial Bank, Kingsland, Mr. A. B. Hutchings, architect; Whittington House, Whittington Avenue, E.C., Messrs. Edward and E. B. Ellis, architects; St. Dionis Chambers, Lime Street, E.C., Messrs. Huntley and Palmer's, Fenchurch street, E.C., Mr. H. H. Collins, F.R.I.B.A., architect; Imperial Hotel, Exmouth, Mr. W. A. Coombs, architect; Norland House, Clifton, Mr. H. Hirst, architect; Hafodunos, Abergele, North Wales, Mr. John Oldred Scott, architect.

**The New Empire Theatre.**—Messrs. Vaughan & Brown, gas engineers, 16 and 17 Kirby Street, Hatton Garden, 19 Farringdon Road, and Saffron Hill, London, E.C., are executing the whole of the gas arrangements at the new theatre in Leicester Square. The massive chandeliers for the vestibule and side entrances, large

double brackets for the walls of the private boxes, balcony, corridors, foyer and staircases, are all made to correspond with the architecture of the building. The whole of the fittings are made so that they can be used either for gas or electricity when required. The stage is entirely fitted with their patent flash-light system, which enables the gas-man at the index plate to light or extinguish the whole of the gas-lighting on the stage instantaneously. The footlights are embedded in a white enamelled wrought-iron trough, which gives a beautiful reflection on the stage; this we may add has been fitted with their new patent burners. They are also fitting to the stage their improved registered water joints. The capacity of the meters they have fixed in the front of the house are equal to 1,000 burners, while those at the back of the house are equal to 2,000 burners.

## GENERAL.

**Mr. L. Alma Tadema, R.A.**, was, at the annual meeting on Saturday last, elected President of the Royal Birmingham Society of Artists, and Mr. J. A. Chatwin, architect, Vice-President.

**A Memorial of Bishop Hooker** is proposed for Bishopsbourne Church, near Canterbury, in which he is buried. The memorial is to take the form of a stained glass window.

**A Natural History Museum** is proposed for the town of Hamburg, the cost of the building to be about 45,000*l.* Prizes of 50*l.* are offered for the five best plans, and a further prize of 200*l.* will be assigned to the best of the five.

**"Quatre Bras,"** by Mrs. Butler, which belonged to Mr. C. J. Galloway, of Manchester, has been purchased for the Melbourne Museum.

**A Profit of £30,232** is reported on the gas undertaking of the Corporation of Leicester for the past year, which will be applied to the reduction of the borough rates.

**Mr. A. Wetherell** has presented a collection of antiquities to the library of Canterbury Cathedral. Among the jewellery are a crown studded with numerous white topaz and blue beryl, which came from the castle of the Comte la Doucet de Marc, having been saved from destruction at the Revolution of 1792 by the English governess; a jewel found upon the field of Agincourt, and a splendid imitation of the Koh-i-Noor, cut in the finest Spanish crystal, and said to be quite equal in beauty to the original. There is also a collection of coins, containing many rare specimens.

**The Prince of Wales** will lay the foundation stone of the new tower of Peterborough Cathedral in the first week of May.

**The Hanging Committee** for the next exhibition of the Royal Academy will consist of Mr. George Richmond, Mr. J. C. Horsley, Mr. Thomas Faed, and Mr. Peter Graham.

**The Manchester Consistory Court** have authorised the restoration of the venerable parish church of Deane, under the direction of Mr. R. K. Freeman, of Bolton.

**Plans for a Board-room** adjoining the Lodge at Lledarrhu Cemetery have been prepared by Mr. T. R. Phillips, architect, of Pontypridd, and are to be carried out forthwith.

**The Salford Corporation** have secured the picture of *John Hampden's Burial*, by Mr. P. H. Calderon, R.A., for the Langworthy Art Gallery, Peel Park, at a cost of 210 guineas. Some years ago the picture was purchased from the artist by Mr. Agnew for 800 guineas.

**A Marine Promenade** and other improvements to constitute New Romney a watering-place is under consideration, and a preliminary expenditure of 100,000*l.* is proposed.

**The Calcutta Exhibition** was closed on last Monday. Since the opening on December 5 the paying visitors have numbered 817,000.

**A Tapestry Panel** in the style of an old arras tapestry, which was executed at Windsor Works by English apprentices, has been purchased by the Queen. The subject is a view of Balmoral Castle.

**The Equestrian Statues** for Blackfriars Bridge are to be modelled by Mr. J. E. Boehm, R.A., Mr. T. Brock, A.R.A., Mr. Onslow Ford, and M. Longterre, an assistant of Mr. Boehm.

**Messrs. John Warner & Sons** have obtained three gold and ten silver medals for their exhibits at the Calcutta Exhibition; a silver medal was likewise awarded to Mr. R. Warner for his work on orchids.

**Messrs. Archibald, Smith & Stevens** supplied the powerful hydraulic lift, referred to in the description of the Edinburgh Conservative Club. It is one of Stevens and Major's patent low pressure multiplying lifts, receiving the water direct from the mains.

**SEWER GAS.**

AS AN ABSOLUTE PREVENTIVE  
of the entry of Sewer Gas into Dwelling  
Houses by way of the most dangerous inlets,  
viz., the waste and overflow pipes from cisterns,  
baths, lavatories, and sinks, DOULTON & CO.  
strongly recommend the use of

**MANSERGH'S  
IMPROVED GULLY.**

By the insertion of this Gully in the line  
of drain OUTSIDE the house, the common and  
UTTERLY USELESS bell-traps may be dispensed with,  
and direct communication with the sewers is  
effectually broken.

"This is undoubtedly a most important and  
effective trap for preventing the entrance of sewer  
gases into dwelling-houses."—LANCET.

PRICE 10s. 6d. EACH, COMPLETE.

MANUFACTURED BY

**DOULTON & Co.**

High Street, Lambeth, S.E.

DEPOTS:—

**GRANVILLE STREET, BIRMINGHAM,**  
AND  
**100 SOHO STREET, LIVERPOOL.**

BY HER MAJESTY'S ROYAL LETTERS PATENT.

ESTABLISHED A.D. 1774.

**AUSTIN'S**  
NEW IMPERIAL PATENT  
**SUPERFINE FLAX LINE.**

The above article is now being manufactured and sold in large  
quantities for Greenhouse Sashes, Public-house Shutters, and  
other heavy work. The Manufacturers would recommend it for  
its strength, and the large amount of wear in it, consequent on its  
peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND  
BLIND LINES (two Prize Medals awarded). The Manufacturers  
of the above articles particularly wish to draw the attention of  
the trade to their Imperial Patent Flax Sash Lines, of which  
they are now making five qualities; and they strongly recommend  
that in all cases they should be purchased in preference to the  
patent lines made from jute, which article has neither the strength  
nor the durability of flax, consequently cannot give so much  
satisfaction to the consumer.

They also invite the particular attention of the trade to their  
IMPERIAL PATENT BLIND LINES, which are very superior  
to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Mer-  
chants, Factors, and Wholesale Houses in town or country.

N.B.—Please note that all our goods as advertised above are  
labelled either inside or outside with our Trade Mark—The  
"ANCHOR."

**LEAD GLAZING WORKS.**

W. RAMSEY,  
No. 29 (late 33 and 34) Farringdon Street, E.C.  
Designs and Prices free.

# LINDSAY'S

## IMPROVED PATENT REVERSIBLE TREADS & LANDINGS

### FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

In Hospitals, or places where it is desirable to be free from dust, the blocks can be placed close together, not leaving any cracks, so that the treads or landings can be swept or washed quite clean; also, if it be necessary to get light under a Staircase or Landing, rough glass blocks can be fitted in the Iron frames, side by side with the wood, and a subdued light thus obtained.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be re-filled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works,

# The Architect.

## THE ARCHITECTURAL EMPLOYMENT OF IRON.

OME amount of interest was awakened about a year ago by the report brought home from the United States of America by Mr. GALE, concerning the new ways of building construction which had come under his notice during a brief tour in the New World as the holder of the "Godwin Bursary." As the first of what we hope may be a long and creditable line of travelling students, induced by this annual prize to go specially forth into foreign lands in search of ingenious novelties in the practice of building

(which many of us might otherwise too fondly suppose are only to be met with in England), it was doubtless the right thing to do when Mr. GALE went straight to America, as the first quarter in which, even if there were not much for us to imitate on a large scale, there ought at any rate to be a good deal to attract attention in detail.

Mr. GALE brought over a considerable amount of information well worth hearing, and a collection of drawings even better worth seeing; but it cannot be denied that the expectations of those who thought there would not be much in all this to revolutionise English architecture were pretty well borne out. American architects for the present are following those of England and France, certainly not leading them. The whole world knows how active and inventive the Americans are in all kinds of business, and how multitudinous are the products of their activity and invention in the shape of clever contrivances, sometimes perhaps a little too clever, if very seldom not clever enough; but beyond this point, in building if in nothing else, they do not as yet seem to reach. Nevertheless it would probably be a mistake to suppose that American freedom of mind may not here and there be indicating, to those who can read the language, the direction of coming progress.

There is one thing with reference to which we may fairly ask whether or not the Americans are thus advancing, namely, the employment of iron. Say what we will, under the inspiration of tradition, as to the impracticable character of this material for the purposes of building on a grand and permanent scale, there can be no doubt whatever that it is being forced into use throughout the world with all that resolute persistency of trade which customarily insures success; and perhaps we shall meet with no contradiction if we express the opinion that, in spite of Crystal Palaces and St. Pancras Railway Stations, besides what has been done on the Continent, it is in America that such persistency is being most emphatically displayed. One reason may be stated thus:—In Europe the employment of iron in building of the architectural rather than engineering kind is recognised only as a cheap expedient to be kept strictly under control by the dignified demands of more costly construction, but in America the cheapness of the material is the one overpowering consideration which entitles it to be accepted with especial enthusiasm, not out of mere parsimony, but rather for the sake of the greater quantity of good service that can be had out of it for good money. From this point of view, then, we cannot but see that iron is being already turned to account in the American towns upon principles very different from those which we are accustomed to associate with the material in England; and the question to be asked is what these principles really are.

What will perhaps first strike the observer who would begin at the beginning in his criticism is the circumstance that the use of iron castings for the miscellaneous appliances and small fittings of buildings, whether concealed or exposed, seems to be considered allowable in America, for the sake of cheapness, both to a greater extent in principle, and with a less restrained liberty in practice. In other words, the contempt of sham, which with us is now provoked so unreservedly amongst people of taste when cast-iron (of all things in the world) takes the liberty of offering an imitation of the outward presentment of superior materials and workmanship, appears to

be comparatively unknown to the Transatlantic public. This, however, is not a thing upon which we should be disposed to dwell with much seriousness. We should be content to let it pass as an inadvertency of the multitude, if we could discern in the architectural design which appeals to higher culture a disposition to place iron construction upon a better basis. But it must be at once acknowledged that some American architects are here at fault to a degree which is scarcely creditable to them.

Readers of Mr. FERGUSON'S "History of Modern Architecture" will scarcely need to be reminded of the outrageous construction of the dome of the Capitol at Washington. The circular hall, which is covered by this superficially majestic crown, is nearly 100 feet in diameter. For about 90 feet in height from the floor—that is, to the level of the general roof—there is carried up around this hall the usual solid walling of substantial thickness. But, rising 130 feet above this, the complete structure of the dome, as visible above the roof, with 50 feet added in the form of a lantern at the summit—making 180 feet in all of height—is literally made entirely of iron, including all the paraphernalia of outer cupola and inner cupola, two complete peristyles externally, and one inside. All this was completed less than twenty years ago. And all this was painted, and is repainted periodically, to represent stone masonry.

It is not to be alleged that this stupendous counterfeit would be imitated in detail now by the leading architects of the United States; but neither can it be safely said that it would not. Mr. GALE shows us domes of what may fairly be called the highest local pretensions, which, if not erected of the same prodigious magnitude, are designed on the same spurious principles of construction so far as they go. Iron-work of perfect mathematical design, as an interior hidden framework, supports a covering of slating, or of metal, or of terra-cotta, quite indiscriminately, as a mere shell for the sake of the outline, and, with a little judicious administration of current Parisian mouldings, all in thin metal, behold a dome! If such a structure, upon more rigid scrutiny, is found to contain a garret room, perhaps it may be called a roof, a curb roof, an ornamental roof, a French roof, or what not; but if it is, on the contrary, a detached cupola, erected for the admiration of architects, then it is a question whether the composition is not of less architectural merit, rather than more, when compared with the mere timber-trussing and lead-work which did duty for domes in London from fifty to a hundred years ago. Iron construction is, at any rate, not in this instance developing itself under the popular formula "design in beauty, build in truth."

But if we are inclined to disapprove of slender wire-work skeletons covered with flimsy sheet iron or thin slabs of terra-cotta, to take the place of the domes of the Renaissance, what shall we say when equally meagre framing is used for the ordinary upright walls of streets, made indeed of T-iron throughout, to which to attach by means of screws an outer cuticle of slabs, of terra-cotta or whatever other artificiality of extreme tenuity, whereby to build a house, no doubt in a few weeks, which shall possess at once all the appearance of a mansion of hewn and carved stone and all the cheapness of a trumpery railway shed? For this, we are allowed to understand, is, after all, the chief development of what is called iron construction in the great American cities. It is enough for the critic to say once for all that American ingenuity is clearly on the wrong track.

Taking, therefore, these three forms in which advanced ironwork is pushing its way on the further side of the ocean—miscellaneous imitative nicknackery, wire-woven domes, and framed slab-walls—it is impossible to say that we have anything offered to us which is worth studying; and we can only express the hope that in course of time the free genius of Americans may do better. And yet, when we contemplate such entire failures, arising in fact from an inability for the present to grasp the first artistic principles which govern building, we are led to reflect that perhaps after all it may not be on the further but on the hither shore of the Atlantic that the new building material which iron no doubt professes to be shall presently find the opportunity for its development, in the direction of sound science, coupled from the birth with graceful style. If so, however, we have not yet done much to justify the expectation. Our Crystal Palaces have not hitherto been designed with care. They continue to be too often little more than the Chatsworth greenhouses of PAXTON, their originator.

Our railway stations, with their sometimes majestic roof-framing, are unquestionably better. A minor example here and there, chiefly an interior without an exterior to correspond, may be pronounced to be very considerably in advance, so far as it goes. But a perfect interior with a perfect exterior is what we cannot point out, either for the satisfaction of the critic or the contemplation of the student; and indeed we do not know where to put our finger upon one in a foreign country. Even iron bridges are on the whole, except the very simplest of them, more displeasing than not; although no doubt the spider-web suspension bridges of America, in the eye of anyone else than a wireworker, must be regarded as the *ne plus ultra* of the entirely graceless.

It has been remarked that the attempt to make architecture out of ironwork is in itself an abandonment of the architectural principle as it has hitherto been understood—the principle, that is to say, of enduring majesty. There is a great deal in this. But if iron is to be developed as a building material, art will inevitably find its way to it and make it its own.

### ENGLISH MEDIÆVAL CASTLES.\*

THERE has long been need of a trustworthy work on the remains of the military architecture of mediæval England. At last the want has been supplied by the man who is most competent to describe the buildings. For half a century the opinion of Mr. G. T. CLARK on all questions relating to the arrangement of an old English castle or fortification has been recognised among archæologists, who are not prone to admit the existence of living authorities. The subject has been investigated by him with a marvellous patience and enthusiasm, and the fabrics have been described with photographic fidelity. At all times Mr. CLARK has been willing to give to others the benefit of his own experience, and to recognise the humblest efforts of lesser men to follow him. He has now collected in two massive volumes his essays and papers on English fortification, and they form a work which will be a treasure to archæologists, topographers, and students of history. The castles which are described are arranged in alphabetical order, beginning with Alnwick and ending with York. By this plan it is always easy to refer to any one history without trouble. It would have been a great advantage if a general index had been given. The two volumes are a mine of information, but it is not every reader who is endowed with a memory sufficiently retentive to preserve such a mass of details. One likes with a work of this kind to collate what has been said in different parts on a particular subject, and without an index the process is onerous. It must be said, however, that Mr. CLARK has ordered his description in such a way that there is a general uniformity in the arrangement of the divisions, and that as history precedes description, and the remarks on any modern restoration which may have been carried out come last, it is possible to guess the position of the statement which may be sought. An index is, however, indispensable. The majority of the descriptions are accompanied with plans and others have views, which vary in accuracy. Although there are some engravings by LE KEUX, we have no hesitation in saying that the most valuable illustrations are those of Coningsborough Castle by Mr. A. S. ELLIS, which are rightly described by Mr. CLARK as being worthy of the fortress they represent.

There is a proverb which says that an Englishman's house is his castle. Happily it has its parallel in other languages, as when the French say, "*Chiffonnier est maître dans sa chaumière*," and wherever the words are employed they are a testimony to the supremacy of law over force. A proverb of this kind is a sort of gauge of progress, for at one time it would be nonsense to speak of any structure being a castle unless it were constructed of massive masonry, and able to withstand the assaults of assailants. We have become so accustomed to regard the remains as picturesque adjuncts to a landscape that the original purpose of their existence is forgotten, and we can with difficulty realise the fact that every castle was designed with a view to war, and that it might be the chief point of attack. The first thought of the builders after obtaining the royal permit to erect a castle would there-

fore be to secure the safest position, and the second to adopt such forms for building as were considered to be safest against enemies, whether within or without. It would be as unwise in those days to seek for architectural effect as it would be now to estimate the value of a rifle by the ornamentation on the stock. But in these, as in other cases, by seeking after utility some other qualities were also found; and it can be said with truth that many English castles have, like Coningsborough, Rochester, Castle Rising, Newcastle, &c., much beauty about them. How they were designed cannot be ascertained. It is evident that from time to time there was a normal type of castle which was generally recognised as the best adapted for safety, just as in later ages there were systems of fortification; but how the Mediæval VAUBANS contrived to give their services to a number of masters must ever be a puzzle. On this subject Mr. CLARK writes:—

No such thing is known to exist as an original design or a working drawing of a Norman or even an Edwardian castle. In ecclesiastical researches, from the known uniformity of the arrangements this want is scarcely felt, but the plan and details of the castle vary with the disposition of the ground or the caprice of the builder, and although a hall, a kitchen, a chapel, a well, and a barrack are indispensable features in a castle, these parts have nothing of the regularity of position of a nave or choir, a cloister, a chapter-house or a refectory. Nevertheless, great as is the variety in both the plans and details of castles even of the same age, their architects and engineers worked by certain rules, so that if these be studied a clue will be obtained to the age of the work executed. The dimensions, plan, and profile of the earthworks, the presence, absence, or figure of the keep, the thickness of the walls, the plan, figure, proportion and position of the mural towers, the character of the entrance, the material employed, and the particulars of the masonry, all, if carefully observed, afford a clue to the date of the building, or of some of its parts, so that, as a general proposition, a Norman castle may be known from one of the Early English period, or from those of the first or second Edward, and still more readily from those built in the reign of Richard II.

Mr. CLARK in his introduction treats his subject under the following heads:—(1) Earthworks of the Post-Roman and English Periods. (2) Castles at the Conquest and under the Conqueror. (3) Castles under the Successors of the Conqueror. (4) Castles in the reign of HENRY II. (5) Castles at the latter part of the Twelfth Century. (6) The Rectangular Keep of a Norman Castle. (7) The Shell Keep. (8) Castles of the Early English Period. (9) Edwardian or Concentric Castles. In each of these divisions the reader is surprised by the great knowledge exhibited by the author, and which is based upon careful observation and research.

The position of the early mounds was not fixed by chance. Moated mounds, it has been observed, are near parish churches. They are numerous in Normandy and the pattern corresponds with the English. The inference to be drawn is that the knights who accompanied the Conqueror raised embankments around their new homes on the same plans as those which had protected their Norman houses. Another form of mound—called a moot-hill or a toot-hill—was without a ditch, and therefore was accessible for civil assemblies. The name lingers in Tothill Street, Westminster, although there is no trace of a mound. Earthworks appear to have been the strongest kind of defence in England at the time of the Conquest. It has been often asserted that there were no Saxon houses of stone. Whether this is true or not, there seems to be no doubt that "save a fragment of a wall at Corfe, no military masonry decidedly older than that event has as yet been discovered." WILLIAM was aware of the advantage of castles to enable him to retain his hold upon his new possessions, but he also knew that there was danger in the existence of nobles who were able to defy the law from behind the walls. The control of all castles was therefore claimed by the Crown. Two kinds were erected, one in masonry, the other of timber, and of the former there were two types—the selection being apparently determined by suitability to a position which had been occupied by an earthwork:—

The castles of the eleventh and twelfth centuries, whether in Normandy or in England, were of two distinct types, those with the rectangular and those with the shell keep. The former type was almost always employed when the site selected was a new one; the latter, where the site was old, and where there existed a "motte" or mound. There are exceptions to this; that is to say, the rectangular keep is occasionally found on an old site, but the shell keep is never found on a new one. The distinction was

\* *Mediæval Military Architecture in England.* By G. T. CLARK. Wyman & Sons.

mainly due to the fact that the massive heavy tower could only be safely founded upon solid ground, whereas the lighter and more widely-distributed weight of the shell keep was better suited to that which was artificial. The shell keep was the most numerous of the two; but the tower type, being of a more solid and more durable character, has lasted longest, and is at this time so much the most common that it has been designated by writers of authority as the type, instead of as but one of the two types, of a Norman keep.

In England we have about fifty extant or well-recorded examples of rectangular keeps, of which the earliest is the White Tower. There are forty examples more or less perfect of the shell keep. The next marked type that came into favour was one with cylindrical towers or donjons. The finest example of the Early English castle is to be found not in this country but in France, at Coucy, a building on which the late VIOLLET LE DUC was enabled to work without any stint of funds. The principle of cylindricity was carried much further in the concentric castles of the Edwardian period, of which some fine examples are found in Wales. Mr. CLARK describes those buildings at a length that is proportionate to their importance, the largest space having been devoted to the Tower of London.

The restoration of an English castle is not always entrusted to competent hands, but there have been notable exceptions. The first place should always be given to what was done for the Marquis of BUTE at Cardiff and Castle Coch. Mr. CLARK testifies that at the latter "the restoration is very complete indeed, in excellent taste, and in strict accordance with what has been ascertained of the original structure." Cardiff Castle has been, he says, completely remodelled; "the details are in that semi-Italian style in which BURGESS was so great a master, and all that a very refined taste, on the part of both the owner and the architect, could devise, has been executed in a manner and with a profusion which more than rivals Alnwick." The phrase "semi-Italian" may induce some readers of the book to draw an erroneous conclusion respecting the beautiful work that is found at Cardiff, and which has no resemblance to the Italian work introduced at Alnwick by CANINA. In one case we have Gothic in all its luxuriance, in the other there is some of the coldness which characterises Italian Renaissance when transplanted from its native soil. The incongruity between exterior and interior which is apparent in Alnwick is not felt at Cardiff. The late Mr. SALVIN restored a few castles, and generally with sound judgment. He almost rebuilt Alnwick Castle; but, according to Mr. CLARK, he preserved with scrupulous care all that admitted of preservation, "adapting his new work to the period of the first and second PERCY, the founders of the later castle." At Dunster, in Somerset, he carried out some extensive works, including a tower and additions to the Elizabethan house.

### PARIS NOTES.

SATURDAY was the last day for the reception of paintings destined for the Salon, and a busy scene, enlivened by a glorious sun, was enacted in and around the Palais de l'Industrie. All through the day artists were arriving in scores, some bringing their exhibits in cabs, others in hand-carts, and still others in the humble wheelbarrow. At six o'clock the doors were mercilessly closed, with the result that several would-be exhibitors had to go disappointed away. On Monday the election of the jury for the painting section was held amid unusual excitement, owing to the numerous rival lists that had been put forward and the uncertainty of the result. The poll was open from 9 A.M. to 4 P.M., being presided over in turns by MM. Bonnat, Yon, Jules Lefebvre, and Humbert—officers of the *Société des Artistes Français*. It must be noted that this body had caused a notice to be posted indicating that the "Association remained aloof from the election struggle and patronised no candidature whatever." The counting of the votes lasted from five o'clock until two on Tuesday morning, and was found to give the following results:—MM. Henner, 1,313; Harpignies, 1,251; Bonnat, 1,230; François, 1,206; Vollon, 1,199; Jean-Paul Laurens, 1,168; Tony Robert-Fleury, 1,154; Puvis de Chavannes, 1,123; Jules Lefebvre, 1,122; Bouguereau, 1,108; Cabanel, 1,069; H. Pille, 1,057; Busson, 1,055; Duez, 1,040; Ribot, 1,006; Lalanne, 1,005; Humbert, 1,001; Hector le Roux, 948; de Vuillefroy, 942; Bernier, 937; Guillemet, 926; Carolus Duran, 920; Roll, 884;

Rapin, 870; Barrias, 862; Maignan, 834; Yon, 821; Detaille, 812; Lansyer, 797; Feyen-Perrin, 787; G. Hanoteau, 775; Baudry, 751; Benjamin Constant, 750; O. Boulanger, 748; H. Gervex, 709; de Neuville, 693; Luminais, 609; Guillaumet, 606; Jules Breton, 596; and Cormon, 568. In addition to these forty members of the jury proper, the following were named as supplementary jurors:—MM. Renouf, 553; Bastien-Lepage, 552; Van Marck, 531; Cazin, 525; Saint-Pierre, 470; Delaunay, 466; Lapostollet, 450; Hébert, 458; L. Lhermitte, 453; and Protais, 444.

No less than 7,000 oil paintings, water-colours, and drawings have this year been sent in for examination. In the section of sculpture, medallion and jewel engraving, exhibits must be delivered to the Palais de l'Industrie between March 21 and April 10; in the architectural section from April 2 to April 5; and in the section of engraving and lithography, from April 2 to April 5 also. The elections for the juries of these several sections will be held on April 11, April 7, and April 6 respectively.

The Salon Managing Committee have decided that no work of art that was exhibited in the National Triennial Exhibition of last autumn shall be admitted to the Salon. It has also declined to accept an offer made by the Edison Electric Light Company to light up the Salon in the evening on condition of receiving one-half the receipts.

The two bronze groups by Cain, so much noticed at the last Salon, and representing respectively a lion and lioness quarrelling over the carcase of a boar, and a combat between two tigers and a rhinoceros, are to be placed one on each side of the ground flight of steps in the Tuileries Gardens, facing the Rue Castiglione.

The painting by M. Roll, representing the passage of troops on the Place de la République on their return from a distribution of colours, has been presented by the State (which purchased it from the Salon of 1882) to the City of Paris, and will be placed in the new Hôtel-de-Ville.

The Syndical Chambers of the Paris Trades announce an exhibition of their manufactures for May 1, to last three months. It is to be held in the Salle des Etats at the Tuileries, and will comprise two distinct sections. The exhibits on the modern side will consist of jewellery, precious stones, bronzes, enamels, coins, and medals, &c., while the retrospective section will comprise collections of similar articles to be lent by private individuals and the State, among which will appear the famous French Crown jewels. As these are shortly to be disposed of by public auction, it will probably prove the very last occasion for their inspection. The Syndical Chambers pursue a double object:—First, to show what the Parisian artisan has already accomplished, and is able to do; and next, to raise funds for the encouragement of industrial art, and the alleviation, as far as may be, of the existing crisis. They already keep up several schools of design and professional establishments in the shape of industrial museums; while another good work they are striving to realise is the creation of an industrial asylum for the reception of children abandoned by their parents, whose unruly spirits or vices preclude the idea of their being apprenticed to private masters. For this purpose the Prefect of the Seine, at their suggestion, is negotiating with the State for the acquisition of the Iseure estate.

The first stage of the competition for the Grand Prix de Rome in architecture has resulted in the admission to *loges* of the following young artists, ranked in order of merit:—(1) M. Maillard, pupil of M. Guadet; (2) M. Devienne, pupil of MM. Simonnet, Coquart, and Gerhardt; (3) M. D'Espony, pupil of M. Daumet; (4) M. Debie, pupil of M. Gnadet; (5) M. Pierre André, pupil of M. André; (6) M. Lafon, pupil of M. André; (7) M. Marcel, pupil of M. André; (8) M. Quatesons, pupil of M. Pascal; (9) M. Louvet, pupil of MM. Louvet and Ginain; (10) M. Defrasse, pupil of M. André. The subject given for this preliminary competition was the plan of a polytechnic school or college.

Eight artists have been admitted to take part in the second stage of the competition for the Grand Prix in medallion and jewel engraving, in which competitors have to undergo two ordeals

previous to entering *loges*. In this stage the work set consists in modelling a nude figure in bas-relief on a ground 26 inches by 20 inches. It must be executed in four sittings of seven hours each, and the relief of the figure is not to exceed 6 centimètres ( $2\frac{2}{5}$  inches).

It may not be generally known that every competitor for the Grand Prix de Rome is entitled to a certain indemnity, the amount of which is at present fixed at 300 frs. for painters and sculptors, 200 frs. for architects and engravers, and 100 frs. for musicians. A petition is now being signed among students of the three last-named branches, praying the Minister of Public Instruction and Fine Arts to put them on a par with their *confrères* of the brush and chisel.

The Biennial Prize, founded in connection with the Académie des Beaux-Arts by the late M. Viollet le Duc, to encourage the study of the higher branches of architectonic art, will be offered for competition this year. Essays must be sent in to the secretary of the Academy before the 1st of next month, and those that take prizes will remain the property of the Academy. The declared object of the founder was to "determine as far as possible, by special study and research, the style and form of the elements of modern architecture."

Another relic of old Paris, the Rue Vauvilliers, is about to disappear to make room for an extension of the Halles Centrales. This narrow thoroughfare contains, or did contain, several hotels or restaurants that once enjoyed a great celebrity, chief among them being the "Pied de Mouton," the "Soleil d'Or," the "Vieux Bouchon," and the "Chat qui pélite," an inn which dated from the early years of Louis XV's reign. There still exist a dancing-room, and a little barber's shop, more than a century old. The street was once called the Rue du Four, as it contained the public baking-oven kept up by the Bishop of Paris; and under Louis XV. and XVI. it was the headquarters of the pottery and glass trades. Lavoisier inhabited a house in the Rue Vauvilliers in 1769, and it is said that Napoleon I., when a lieutenant of Artillery, lodged at the Hôtel de Cherbourg, adjoining the "Pied de Mouton."

A measure similar to that recently carried out at the National Library is about to be adopted for the National Archives Office and Ecole des Chartes. This building, in which priceless documentary treasures bearing upon the history of France and Europe are contained, is surrounded by workshops in the midst of a densely-populated neighbourhood, and thus greatly exposed to destruction by fire. A chemical manufactory, in fact, adjoins the Archives. The Government now propose to expend two million francs in buying the surrounding houses; so as to completely isolate the building, and give room for enlarging it at some future time. There are said to be upwards of 30 million portfolios of papers piled up within the walls, and to them access can be obtained at present only with great difficulty. The proper classification of papers sent in by the various Government offices is also quite impossible.

Two arcades from the Tuileries Palace have been preserved, and will be shortly erected in the gardens facing their old site near the Orangery. One of these formed part of the right wing of the Pavillon de l'Horloge, and is the work of Philibert Delorme himself; the other, from the left wing of the same, was executed by Jean Bullant.

The Exhibition of the Aquarellistes in the Rue de Sèze will close on Sunday next, the 23rd, after which the galleries will be placed at the disposal of Madame Louis Leloir, for the exhibition and sale of the works of her late husband.

M. de Sabouloff, formerly Russian Ambassador at Berlin, has sold his celebrated collection of Tanagra figures, collected during his residence as Minister at Athens, to the Swiss Government, for 375,000 frs. It is also stated in the Paris papers that the remainder of his collection of antiquities has been purchased by England for the sum of 25,000*l*.

A commemorative tablet is to be erected at the Ecole des Beaux-Arts in honour of the great painter Louis David, whose

remains are interred at Brussels, where he died in exile. The inscription will be as follows:—"To Jacques Louis David, restorer of the modern school of painting in France; born in Paris on August 18, 1748; deceased at Brussels on December 29, 1825."

### THE ARCHITECTURAL ASSOCIATION.

THE ninth ordinary meeting of the Association was held on Friday evening, the 14th inst., Mr. Cole A. Adams, president, in the chair. The following gentlemen were elected members:—Messrs. F. W. Marks, R. W. Sampson, H. G. Driver, C. H. Driver, J. P. Oliver, C. J. A. Steven, J. G. Hart, W. A. Chambers, D. Blow, and H. Messer. A vote of thanks was then passed to Mr. Gribble in connection with the late visit to the Brompton Oratory. The next visit was announced for Saturday, the 22nd inst., to Mr. MacVicar Anderson's National Scottish Church, Belgravia.

Mr. A. B. PITE presented the Sketch-book of the Boston Architectural Association, which that Society had just sent for presentation to the Association. He said that those who looked into the book would rather tremble for their spurs, and he hoped that one effect of the gift would be that they would all be stirred up in the matter of sketching.

The PRESIDENT said the Association would feel great pleasure in forwarding by the hon. secretaries their thanks to the Boston Architectural Association. He agreed with Mr. Pite as to the excellence of the sketches, but he was not prepared to surrender the palm to their friends across the water in the matter of sketching. A vote of thanks was passed.

Mr. HAMPDEN W. PRATT then read a paper, as follows, on

#### "Shams."

I feel I must claim your indulgence in addressing you this evening on the subject which I have chosen, for I must of necessity traverse familiar ground and dwell on principles which have constantly engaged our thoughts. But believing as I do, in putting more into practice the true principles which we profess, and which underlie all good art, I have ventured to bring before you some few methods of construction we adopt and materials we use, with the view of considering how far we legitimately employ such, and wherein we fail to attain the standard of perfection. As architects, we should do all in our power to uphold the dignity of our noble art; in other hands much is done in the name of architecture which makes our blood boil, and we must look to it that we ourselves are blameless, and endeavour to maintain the glorious traditions of the past and hand down to posterity works, whether great or small, which are worthy of the age we live in. No work should be considered too insignificant to receive honest thought, for if we are not careful in the small things, the probability is we shall neglect to some extent the more important ones. Let us remember that the foundation of all good work is Truth, and that to be beautiful it must be truthful.

When I joined the ranks of this Association some fourteen years ago, and worked in the class of design, I found myself surrounded by students who looked upon honesty in construction as an essential condition of good design, and if a member of the class ventured to produce anything of doubtful character, he was well and deservedly sat upon. Such training was calculated to impress upon one the paramount importance and necessity of adhering to all risks to truthful design. It was no mere slavish acceptance of a principle, but an eager and enthusiastic compliance. I need hardly say, perhaps, that most of the members were at that time ardent disciples of the Gothic school, and it was considered as utterly opposed to the principles of that style, to adopt anything but what was perfectly straightforward, honest, and true. I do not know how far honest principles govern design in the class at this period, and under the influence of the current fashion in style. My fear is that conscience in these days is more elastic, and that there is a tendency to strain a point here and ignore one there. Are we not inclined to be too lax nowadays? Things which the Goths a few years ago would have scorned to do, they now unhesitatingly put their names to, and a race of young architects will be springing up presently, who will have no masters to look up to for inspiration and guidance in the way they should go, unless they give more heed to the traditions of the good old days, and drink more deeply at the fountain-head.

Now the view I take of "shams" is a broad one; if it were not so, I might say in a few words all that could be said in denunciation of them, and few or none would dissent, I imagine; but I am not prepared to dismiss the subject in so off-hand a way. The truth is we are too much inclined to palliation in these matters; we endeavour to quiet our conscience (if we have not lost it), and we say, that life is too short to burden ourselves with unnecessary cares and anxieties. A sham may be defined, not only as a deception or an imitation, but also as an imposition and a pretence. To be "tricky" is thought by many to be clever, but we should denounce a man who, by devices or tricks, took advantage of us, however clever he might be. If we avoid shams of all sorts, and

produce work in every respect unsullied, we should become "purists," and you will say that there can be no such position tenable. No doubt there are many difficulties to contend with, that it is not easy to practise all we preach, but may we not at least set a high ideal before us, and strive with what powers and faculties we possess to impress our work with the genuine stamp, and raise architecture above mere building?

It is far from my purpose to decry picturesqueness, for one can only wish to see more relief from the dull, commonplace, utterly uninteresting buildings which abound everywhere; but I think there can be too much of a good thing, and on looking around one is disposed to say that there is a tendency to overdo it. Some, apparently, have a strong desire to be original—too original. Features are introduced by the grafting process; the growth is not natural; there is what one would call a straining after effect. May not this be rightly characterised as *pretence*? Disquieting, fidgety forms and details are to be reprobated; they should have no place in our work; they are excrescences, and as such must be regarded as fictitious. Then, with respect to the harmonious blending of interior and exterior design, much might be said; if we could do more to make our exteriors reflect the interior arrangement and purpose, we should accomplish much in the direction of natural development and treatment; there would be more reality about our architecture, and less of the masking propensity. Take, for instance, the treatment of staircases. I regard it as an unpardonable sin to disregard window openings in planning a staircase, or to take no notice of the stairs when designing an elevation, and yet this is being perpetrated every day, and, one regrets to say, unblushingly. I cannot defend the practice. It shows to my mind either poverty of invention on the part of the architect, or wilful disregard of fitness and truth. It is not only with staircases, but with other parts, that the plan is made subservient to the elevation. Windows, fireplaces, and doors are placed in all sorts of awkward positions, regardless alike of comfort, convenience, and health. How frequently it happens that windows are placed nearer the floor than the ceiling, so as to accommodate some fine cornice, or to fulfil the requirements of some order or other! Is this honest treatment? If a style is not capable of being adapted to the requirements of a building, then better by far adopt some other or none at all. Why sacrifice common sense and honest treatment for the sake of a style, or in order to gratify some conceit? Blank windows and doors are not very often met with in an architect's work, and it is to be hoped that he is never guilty of painting false fanlights, sashes, and blinds complete, such as may be seen sometimes. I am aware that architects have difficulty sometimes in dealing with clients, who insist that symmetry cannot be obtained apart from uniformity; and, as a consequence, windows are inserted in the wrong place, and useless features introduced, in order to gratify the wish of those who possess no true eye for balance and proportion. It is this class of people, too, who are dreadfully afraid of putting a tower on one side of a gable, and think the design is incomplete without a corresponding one on the other side, and they have been known to liken such a building to a pig with one ear. Speaking on this subject reminds me that a tower is often introduced and used in a meaningless way, and I am disposed to question the practice of building towers where they are of no use, and especially when louvred openings are formed, where bells are never intended to be hung, and in towers incapable of standing the vibration.

Street architecture has done much to spoil architects for other work; it consists as a rule of a façade, and this idea is too often introduced into a building, even when wholly detached; in other words, perspective is not sufficiently studied. It is a very edifying sight to have a back view of our street fronts from the chimney-pot level, such as we may obtain from the railways passing through the metropolis. It gives us an insight into the efforts often made to secure a commanding or picturesque front, as seen from the street. It will be remembered how the new *Times* office, in Queen Victoria Street, was erected with a large crowning gable, without any roof behind, until public ridicule was brought to bear upon it. The shop-front itself is, however, generally the most unsatisfactory feature in street architecture. Many a building, otherwise good, has been entirely ruined in appearance, owing to the lamentable want of support for the upper storeys—that is, sufficient to satisfy the eye. Every contrivance is adopted to conceal what support there is; columns and stanchions are stowed away mysteriously, and stone facias are bolted and hung up to iron girders in a wonderful way; the apparent strength, without the substance, of polished granite is brought into requisition for pilasters and piers, as in five cases out of six only a veneer of the material is applied. It wouldn't be right for me to blame architects entirely for this kind of construction, doubtless they are often hampered by their clients; but, nevertheless, I think it is their duty whenever opportunity offers, to persuade those who employ them to adopt a sounder, truer, and more satisfactory construction.

Coming now to the question of materials for building purposes, one must express their regret that buildings are fast losing their local character, owing to the increased facilities for bringing materials from distant parts. I am not prepared to say that there are no advantages in this, but I think we should, when possible,

make use of suitable materials at hand, and not go out of our way quite so much to introduce one thing and another. The question of using the right material in the right place, and for the right purpose, ought also to receive at our hands a great deal more consideration than it usually does. Touching the use of manufactured materials, it may be asked how far it is legitimate to use some of these? Bricks have been made from time immemorial of all shapes, sizes, colour, and contour, but I suppose it was not until the last century that they were shaped and worked after being burnt. At the present time there seems to be quite a mania for cut, rubbed, carved, and gauged brickwork, and I would respectfully ask those who defend this treatment, whether they really consider it legitimate? It seems to me a strange, not to say wrong, use to make of bricks. Most marvellous productions of the joiner-bricklayer's art may be seen almost anywhere—bricks cut and carved like soap, and jointed with putty. Strange construction some of this! Terra-cotta has been largely used, and, properly applied, it is a most valuable material. Artificial stone does not sound nice, but I think it may be used legitimately for paving, steps, and such purposes; but for moulded and carved work, and where hand-labour should be bestowed, I think natural stone ought alone to be used. Stucco has never been favourably received, except by speculative builders, who, at comparatively small expense, produce the forms and details appertaining to stone structures. It is needless to say that this treatment is entirely imitative, and unworthy of adoption by any architect. I will say no more on this point. Mr. Aston Webb, in his recent interesting paper on "Plaster-work," alluded to stucco-work in words which I heartily endorse. Of iron it is difficult to speak. It is probable that we are at present only on the threshold of its career; but it is to be sincerely hoped that the day will never come when whole iron fronts will supersede brick and stone construction in this country, as in some parts of America. Fancy describing galvanised iron cornices, window-cills, pilasters, and what not! Such construction seems repugnant to one's sense of fitness, and, as carried out across the Atlantic, must bear a strong resemblance to stone construction. One of our chief faults is in making cast iron to resemble and imitate wrought and hammered work, and architects are very often much to blame in this respect. As a structural material, iron is invaluable; but it is now a recognised fact that to withstand fire it must be encased. This concealment we must accept as lawful, though, I admit, not wholly satisfactory; and I think we ought to make some effort to carry out this encasing in such a way as to show the purpose for which it is employed. One word before leaving the subject of iron. I think architects are too fond of substituting rolled iron joists for brains. If a little difficulty arises in planning or construction, the problem is apt to be solved by the friendly use of iron girders or joists. They are made too much a convenience of, and I think we ought to recognise this.

Half-timber construction calls for some notice. I fear a great deal of the so-called half-timber work is considerably more than half brickwork, by which it is so often backed; and a good deal of it is merely a piece of framework 2 or 3 inches in thickness. Such construction is not worthy of the name, and can only be characterised as sham.

Then as to mouldings in joiners' work, it is getting almost a rare thing to see mouldings worked on the solid. Mouldings are planted on, stuck, and bracketed out, without any compunction; brads, screws, and glue taking the place of what was formerly sound, solid construction. I know it will be admitted, that you would prefer to have solid moulded work, if expense were no object; but this admission only proves that you endeavour to obtain the effect of solid work by the sacrifice of principle. Why not be content with simpler work legitimately executed?

I have referred hitherto, more particularly, to what may be termed structural pretences. I should like now to say a word on those more strictly decorative, and it is in this direction where imitations abound. Marble, being a costly material, is in great demand, and there is an abundant supply of clever imitations. It surprises me to see architects so frequently using scagliola; it is a downright sham, of course, and so are all the marbles made of slate, and it would be a great blessing if all this false stuff could be swept away. Chimneypieces, perhaps more than anything else, are conspicuous features in a room, and how often they are constructed of false material, and boxed out to appear solid. If people are accustomed to endure false things at their hearth, no wonder they will put up with, not to say revel in, all sorts of imitations and deceptions elsewhere. The marble mania also extends to painting or marbling, even to the absurdity of making a metal bath resemble marble! Porcelain is also marbled, and the difficulty is sometimes to obtain goods of this class which are not imitations.

Graining is an old device, and seems never likely to die out. Trade decorators are perhaps most responsible for its survival; give such a man *carte blanche* to decorate your house, and I believe he would grain or marble it from top to bottom! Of late years a good deal of walnut wood has been used, and now walnut instead of oak graining is beginning to be used. If our friend the decorator takes a fancy to this sort of wood, we shall be one day nauseated with walnut graining. It is a poor excuse which people offer for graining, when they say that it is done to preserve the wood, and wears ever so much better than paint. One thing they

omit to add is that the woodwork grained is of an inferior kind to that imitated—herein is the dishonesty. I don't say that one is deceived into believing that the graining is the natural wood, but it is none the less a fraud. What shall we say, too, for veneering? Veneering of wood hardly comes within the range of an architect's work, it is more in the cabinet-maker's line, and it is to be hoped architects will give no countenance to this method when they are called upon to design furniture.

But we are often concerned, not only with things we design, but with articles we select; and it is necessary that we should follow the same principles in one as in the other. The market is flooded with imitations of all sorts; we must be on our guard lest we unwittingly encourage the manufacture of that which is false. It is within our power, possibly, to create and maintain a healthy tone, and we should let no opportunity pass for condemning what we believe to be bad and unprincipled. There is more temptation to produce imitations with the manufacture of new materials, or the introduction of new inventions, and therefore we should carefully watch such and give no encouragement to things of a doubtful or dishonest nature.

With the general adoption of the electric light, we shall be called upon to consider the appropriateness of fittings for it. We are too conservative in this respect, I think; there is too much resemblance, for instance, between the fittings used for candles, gas, and the electric light, and imitations easily creep in. An example of what I mean you will find in the Arbitration room in this building, where the gas in the chandelier passes through imitation candles—a very senseless contrivance, I think. I don't know who admires such things, I shouldn't think architects do; and yet, this particular chandelier is placed in a room mostly used by such. But probably you will not attach much importance to that, for you will agree with me, that the ventilation of this room is a sham, and, if we were anybody else than architects, I expect we should have called for, or applied a remedy, by this time.

In conclusion, let me urge upon all those who are just entering the profession to resolve only to practise the things that are true, to shun all excess, to let the lamp of truth guide them throughout their career, and to remember that the sin no beauty can redeem is sham.

The PRESIDENT condemned the use of shams, but observed that what were and what were not shams was a question open to argument. He then put forward reasons justifying many of the practices which Mr. Pratt had dealt with. Carved and gauged brickwork was peculiarly suited to withstand the London climate, and it remained quite as sharp as when first put, while stonework, on the contrary, rapidly began to flake away. By the use of cast materials, concrete, &c., a durable and impermeable surface was obtained, and at a moderate cost. Besides this, its colour was pleasing, and it had, moreover, been used by leading architects. Purists would have iron construction when used shown, but in the work of nature they found that the framework of bones in a man's body, his ribs, &c., were clothed with flesh, and this was a justification for seeking to clothe iron construction with beautiful forms. There was no deception in these things. The decoration round the stalls at Worcester College, Oxford, was in marbling, done, he had been told, by Mr. Burges. That gentleman no doubt had recognised the beauty of line and colour in marble, and designed to reproduce this beauty as a colour effect for decorative purposes. Simple painting required renewing every few years. Graining did not. Graining would wash well and come up richer in effect every time it was cleaned. In the matter of veneering, Mr. Burges had proposed to carry out the decoration of St. Paul's by veneering it with slabs of marble. It would, therefore, be seen that in carrying their desire for truth too far they might possibly overstep the mark, and fall back on a quaker-like simplicity altogether unsuitable to the present age.

Mr. A. B. PITE proposed a vote of thanks to Mr. Pratt for his paper. He said he thought they ought to distinguish between imitations and simple shams, for it was quite possible to imitate without producing a sham.

Mr. STANNUS seconded the vote of thanks, and said that the President had, he thought, shown that many things Mr. Pratt had treated as shams deceived no one. The use of veneering was quite allowable under certain circumstances, and when done according to proper rules. If it were allowable only to use solid materials, gilding must be condemned. Instead of setting men to beat out gold into leaf, one would have to put up solid gold. Mr. Burges, he believed, had felt there was a wealth and changefulness of colour in marble that no other material would give, and, not being perhaps allowed by the authorities to use marble, he no doubt determined to get the same beautiful effect by a cheaper method. Mr. Pratt had no doubt held up a high standard before them, so that he might get them to meet him half-way, and end by being temperate and consistent, just in the same way as teetotalers had succeeded in making many men temperate because they had taken the highest ground; because they insisted on teetotalism. People would not meet them so far as that, though they would meet them half-way in the matter of being temperate.

Mr. GOTCH said that in the Association they strove for the ideal. He had started with very correct principles, but he soon found, in regard of architects carrying out shams, that they all

did it. Clients insisted in many cases on the perpetration of shams, and he did not remember any case in which an architect had thrown up his commission rather than do these wicked things. He thought himself that it was rather a good thing to let such a client imprint his individuality on his house, viz. the individuality of a man of no taste.

Mr. BRODIE and Mr. BERRY, hon. secretary, then made some remarks.

Mr. MOUNTFORD said he agreed with every word that Mr. Pratt had said, but thought there were several shams that had been overlooked—one, for instance, was the fusion of one or more styles in a building.

The vote was then put and carried by acclamation.

Mr. PRATT, in replying, acknowledged that he had put his subject somewhat in an hypothetical way, and he quite agreed with the various speakers as to the impossibility of carrying out his advice strictly. If the ideal were a high one, they would, as Mr. Stannus said, rise half-way, more than which could not be expected.

## DISCOVERY OF A ROMAN ALTAR.

THE following account of the Roman altar discovered by workmen in digging the foundations of the new tower of St. Swithin's Church, Lincoln, has been given by the Rev. Canon Venables:—This interesting relic of a remote past stands 3 feet in height, by 1 foot 8 inches in breadth at the base, and 1 foot  $3\frac{1}{2}$  inches in the upper part; the corresponding depths are 1 foot 2 inches, and  $12\frac{1}{2}$  inches. The altar is hewn out of a single block of oolite, of the same bed from which the Roman arch at Newport Gate was built, and belonging probably to the same period; perhaps, early in the second century of our era. The upper part is unfortunately mutilated, and there are hardly any traces of the basin-shaped cavity or *focus* in which the sacrifice was consumed. Each side is carved in low relief; the right hand side bearing the *praefriculus* or pitcher containing the wine for the libation, the left hand side the *patra* or shallow dish used for pouring the wine upon the offering. The sacrificial knife, which is a usual companion of these vessels on Roman altars, is wanting. The inscription on the face is happily perfect, the letters being nearly as sharp as the day they were first cut. It is as follows:—

PARCIS. DEA  
BVS. ET. M  
MINIBVS. AUG  
C ANTISTIVS  
FRONTINVS  
CVRATOR. TER  
AR. D. S. D.

Which may be thus rendered, "To the goddesses, the Fates, and to the Deities of Augustus, Caius Antistius Frontionus, being curator for the third time, erects this altar at his own cost." The last three letters are a common contraction for "*de suo dat.*" A word or two may be added concerning the dedication of the altar, and the person who dedicated it. Hitherto only three altars dedicated to the "Parcae," or Fates, have been found in Britain; at least only three are recorded in Hubner's great work. All of these belong to the Carlisle district, viz. two found in Carlisle itself, and one near Silloth. In two of these the Fates are designated as "Mothers," "*Matribus Parcis*," not "Goddesses," as here. This is what we might expect, for the Fates was only another name for the Mother Goddesses, "*Deæ Matis*," whose worship was a favourite one among all the Teutonic races. Roman monuments, commemorating these goddesses, are far from uncommon in Britain. One was found some years ago at Ancaster, and, according to Mr. Thomas Wright, one also at Lincoln. This is perhaps now in the British Museum. An altar dedicated to them has been found at York, and they are frequent in the vicinity of the Roman wall. These local deities answer to the *waelcyrian* of the Anglo-Saxons, transformed by Shakespeare into his three witches of Macbeth, answered to the "*Parcae*" of the Romans, or the "*Tre Fate*" of the Italians, and were regarded as having the life and death and fortunes of mankind at their disposal. They were always three in number. The dedicator of the altar, Caius Antistius Frontionus, is described as holding the office of "curator" or "warden" for the third time. "Curator" is a general term applying, among other matters, to those who had charge of the roads, the navigation, the water supply, the games, &c. It was also a military office. There is an epitaph at Chester to one who had been curator of the second "*ala*" of the Asturian troops, a regiment of which it is interesting to notice the officers, whose funeral slab now in the cloisters was dug up at the foot of Motherby Hill, was a "*decurio*." The second dedication "to the deities of Augustus" has reference not to the deities worshipped by Augustus but to the Superior himself, whose "*memer*" or divinity was, as is well known, a constant object of adoration. The plural form is found on many altars in the vicinity of the Roman wall, being employed to add dignity to the phrase. The name "Antistius" appears in several inscriptions, one of which, now

in the British Museum, was found in Lincoln. That, however, belonged to a different person, "Antistius Adventus," of the 14th legion. Another Antistius, commemorated at Maryport, was commander of the first cohort of Spanish cavalry. The cognomen or surname "Frontionus" is of less frequent occurrence. It is found chiefly as the name of a potter, whose workshop stamp is borne by many fragments of Roman earthenware. Enough has been said to indicate the great interest attaching to this monument. May I add that the Dean and Chapter will be happy to act as guardians of it, and give it a place with the Roman milestone and other relics in the cloisters, until it is claimed for the museum which must soon be established in our historic city.

### THE WATER SUPPLY OF LONDON.

THE discussion on General Rundall's paper on "A System of National Water Regulation," which was read at a meeting of the Society of Arts on the 12th inst., was opened by Sir Robert Rawlinson, C.B., who spoke as follows:—Mr. Ruskin some time since recommended compensating reservoirs to regulate the floods in Italian rivers; but if he knew as much about floods as he said he knew about pictures, he would never have hazarded any such remarks. Reservoirs might be made for any purpose, and he did not disparage them for the purpose of canals or water supply, but as to making compensation reservoirs to regulate or diminish river floods all the capital in the country would not do it. Such reservoirs must be either full or empty; if they were full they would be of no use, as they would hold no more water, and if they were empty, probably two days' very heavy rain would fill them. In a small area he had under his own control, where the dry-weather flow was about 250,000 gallons per day for months continuously, the flood flow was in one day upwards of 90,000,000 gallons. What size, then, must be the compensating reservoirs for such a district? Where would you find the sites or the money necessary to make compensating reservoirs for the Thames? Last week he went down to inspect the water supply recently formed for the town of Leeds; not quite finished. The reservoirs were about the finest he had ever seen; they were in the valley of the Wharfe, three in number, one below the other; they cost from 150,000*l.* to 200,000*l.* each, and were capable of impounding 20,000,000 gallons per day. Out of that they were obliged to send 6,000,000 for compensation, leaving 14,000,000 for Leeds, and at one point they had pumping power by which they could raise 6,000,000 more if required. Those works, with the necessary distributing apparatus, had cost some 1,500,000*l.*, the population being about 320,000, or about 5*l.* per head. The metropolitan water supply took each day about 150,000,000 gallons of water from the Thames, the Lea, and the chalk springs, equal to about one-third the dry-weather flow of the Thames; but the quantity actually taken from that river was about 80,000,000 gallons. The various works were valued by Mr. Smith for the late Government at 33,000,000*l.*, but the present Government repudiated the bargain, and denounced it as a job. As an engineer, having some knowledge of the value of water-works, he said it was not a job; he believed it was as honest a valuation as ever was made, by as able a man as ever undertook such a task, and that London would never again have so good a bargain offered it. He made this remark because the subject must come up again. He quite agreed with General Rundall, that the utilisation of water should, in many respects, be both national and municipal. Water should not be dealt with like sugar, butter, or beer; it should not be dealt out so as to produce the largest dividend, but should be so stored that it could be utilised by the community at the cheapest cost, and that all surplus might be used for public purposes at prime cost. Dwellers in London knew what a condition the streets and footways were in after two or three small falls of rain; but if the water-supply were in the hands of the municipality, every public footway might be washed with water, not costing more than  $\frac{1}{4}$ *d.* per 1,000 gallons, instead of 6*d.* or 8*d.*, as was charged by the companies now; and they would then be made as clean as they were after a heavy thunderstorm, every week, and every day, if necessary. All the great municipal bodies were acquiring the water-supply in the same way as London would have to do, if any municipal body were established which could have the control of it. They would have to pay a fair and honest price for it, not a confiscating price. That price would necessarily be large, but it would not be dear, if in future they had no more dividends to pay, but only the interest on the capital, which a community like London could borrow at  $3\frac{1}{4}$  per cent. The companies were now paying 8, 10, and 12 per cent., hence the great value they put on their works; and as the works extended, that interest went on in the same ratio on a larger capital. If the municipality had the works, they would only have to pay the cost of management, and by consolidation from 50,000*l.* to 100,000*l.* a year might be saved in management. It was just the same with regard to gas. Manchester, Birmingham, and Leeds had acquired the gas. Leeds gave a large price for the existing works, but they now supplied gas at 1*s.* 10*d.* per 1,000 feet, and made a surplus. In Birmingham there was not a man in the Corporation who dared

to face the large expenditure involved in purchasing the water and gas works until Mr. Chamberlain became mayor, the idea being that it would saddle the town with an enormous debt, forgetting that when you bought a paying property you were not incurring a debt, but acquiring an estate. In 1852 he valued the Birmingham Waterworks, and they could then have been bought for some 350,000*l.*; but they were afraid of it. When Mr. Chamberlain became mayor he showed them that they had been losing about 7,000*l.* a-year by not having bought them, and they then gave some 1,250,000*l.* They had been considerably enlarged, the result being that the water was cheaper and better in quality, and was distributed over a wider area, and produced an income which more than paid the interest on the capital and maintained the works in efficiency.

### THE NEW YORK PRODUCE EXCHANGE.

THE new buildings which are in course of erection for "The New York Produce Exchange," will excel in magnitude any commercial building in Europe. The buildings stand on a site facing Broadway, and forming part of Whitehall Street; they can also be approached from Stone and Beaver Streets by means of a new street. No more desirable or convenient site could be found in all New York. The windows in the front of the building will open on the Bowling Green, and in the immediate vicinity is the Battery Park, and beyond, the Bay of New York. The building is within a few seconds' reach of both Broad and Wall Streets, the centres of American financing operations. A short distance from the site all the Transatlantic steamers embark and disembark their passengers and cargoes; the Elevated Railroad cars have a terminus on the spot, bringing it into communication with the whole city; and almost all the ferries converge at this point.

The building, which is Renaissance in style, will be 300 feet in length facing Broadway, and 150 feet deep facing Whitehall Street. Its shape will therefore be that of an oblong rectangle; the height will be about 120 feet, exclusive of clock-tower. The materials will be red and white stone, brick, and iron, thus rendering the structure fireproof. The ground-floor, basement, and upper storeys will be let for offices. There will be over one hundred and sixty offices of all sizes, large and small, available for letting purposes, most of which are already bespoken; and some idea of the rents paid may be imagined from the fact that already the Maritime Exchange and the Pennsylvania Railroad Company have engaged two corner rooms for a long term of years at rents of 9,000*dols.* and 12,000*dols.* respectively. On the first storey will be the great Exchange Hall, the finest room in America, the floor of which will measure 30,000 square feet. On the next floor the committee-rooms, library, reading-rooms, managers' and staff offices will be situated. All will be reached by wide staircases and a number of elevators. Most elaborate measures have been taken for providing every part of the premises with heat and ventilation. The estimated cost of the entire scheme will be between 3,000,000*dols.* and 4,000,000*dols.*; the Exchange has about one-half of this amount already to its credit, and bonds will be issued on the security of the premises, the rents and subscriptions for the other half.

It is roughly estimated by the Committee of Management that the rents of the offices and basements will produce an annual income of about 150,000*dols.*, which can be all applied to the liquidation of the building debt, if necessary. This estimate was made before any one imagined the possibility of such rents being offered for the larger offices as those to which we have referred; and, as the advantages and the value of offices in the building become more thoroughly appreciated, it is almost certain that fancy figures will be offered for the rooms on the more important corridors.

The facilities provided for the speedy transaction of business will be as perfect as it is possible for enterprise and science to make them. There will be a spacious telegraph office on the premises, where members can wire or cable messages to their correspondents all over the world and await the reply, which will be available in a few minutes—thus completely annihilating space, and practically bringing the world within the walls of the Exchange for the convenience of its members. There will also be a telephone exchange, by which the members can constantly communicate with their offices and homes, or from the latter with their agents on 'Change. The commercial library will also be a most important feature, as it will contain a complete library of volumes connected with trade and commerce, and members can in a few moments ascertain any information they require as to commercial statistics, reports, or Acts of Congress. In fact, nothing that money or foresight could provide for the accommodation or convenience of members has been omitted.

Messrs. Walter Macfarlane & Co., Saracen Foundry, Glasgow, have been awarded the highest class gold medal for their exhibits, embracing architectural, sanitary, and engineering art castings at the Calcutta Exhibition.

## NOTES AND COMMENTS.

THE tercentenary of the University of Edinburgh, which is to be celebrated in the course of a few weeks, will bring honours to two painters. SIR FREDERICK LEIGHTON and SIR W. FETTES DOUGLAS are to have the degree of D.C.L. conferred upon them. There are to be sixty-seven other doctors created in April. On such an occasion when so many branches of science and literature and so many nationalities are recognised, it is remarkable that no architect's name appears among the proposed honorary graduates. The University authorities would hardly say that in Scotland there is no architect who in utility can be compared with a Dutch lawyer or a fashionable physician from London. A more catholic spirit should have inspired those who framed the programme, and architecture and sculpture, as well as music and painting, should have their representatives in the United Presbyterian Hall.

THE judgment of the Master of the Rolls in the interminable case *BELT v. LAWES* is not likely to commend itself to the minds of artists. For, if we understand it aright, the meaning is that a work of art is like work described as manufactured, and that it would be absurd for a purchaser in either case to trouble himself with inquiring into how the work was produced, and how many hands were employed. That, we suppose, is the correct interpretation of the law, but it does not tally with people's notions of right and wrong. A picture is bought because it is supposed to have been painted by the artist whose name is upon it. An assistant might produce one as good, but the world does not think so, and it is the world's valuation, not the Court's, which is paramount in such cases. The judgment of the Master of the Rolls will not improve the position of artists, and architects especially will suffer. It was open to anyone to call himself an architect, although he had not received professional training, but henceforth it will be dangerous to say of a man of that class that he receives an undue amount of help. The Master of the Rolls may have said to himself, it is impossible to fix a limit to a "devil's" duties among barristers, and why should not artists be also allowed unlimited aid?

THE CHANCELLOR OF THE EXCHEQUER has not approved of the scheme by which it was proposed that the conservation of Westminster Abbey and the Cathedrals should be undertaken by a Government Department. As generally happens with proposals, there is much to be said in favour of governmental control of those buildings, and much also against it. The Abbey and Cathedrals are national property, and it is unwise to allow them to depend for safety upon chance donations. An appeal was lately made in Dublin for assistance towards the expense of constructing drains at St. Patrick's Cathedral, and the response was a few pence. There is more liberality in England, but it may be said that money might be well laid out on every one of the cathedrals, if it could be obtained. Some people would say that the official builders would not be restrained by reverential ideas, but it must be said that of late years what has been done by the Office of Works does not in any way recall the deeds of JEFFREY WYATT.

THE two French battle painters, M. DETAILLE and M. DE NEUVILLE, will have pictures at the next salon of scenes in the Franco-German war. M. DETAILLE's canvas will be about nineteen feet long, and represents the field of Rézonville, on the evening after the battle. It will contain portraits of officers and men who took part in the victory, and every one who remembers the artist's picture of the *Distribution of the Standards* will acknowledge that M. DETAILLE has a happy knack of catching a likeness. M. DE NEUVILLE's work shows M. CARAYON LATOUR at the head of the Mobiles advancing to attack the Prussian lines. The French artists are doing their best to overcome the cynical apathy with which the war was at one time regarded in France.

THE new Museum of Classical Art and Archæology at Cambridge will, it is expected, be opened during the present term. But money is still needed to obtain an adequate library of books, and to provide in part for the expenses of transporting and arranging the casts and models. Professor SIDNEY COLVIN has therefore appealed to members of the University for aid, and upwards of 600% has been already raised.

THE case of *FRAZER & Co. v. EHRENSPERGER & ECKENSTEIN*, to which attention was lately called, is likely to interfere with the even tenour of the arbitrator's duties. As there must be two parties visible in a fencing match, so plaintiff and defendant must appear before an arbitrator, or his office is fruitless. Apparently it does not matter what kind of agreement may have been entered into when the contract was signed, since either party can revoke their share in the appointment of the arbitrator, and leave him without *locus standi*. It will be difficult to say how far this view of the law will affect disputes over building contracts, which have given rise to an immense number of arbitrations. According to the Master of the Rolls, the arbitrator is the mandatory of both parties, and his mandate can be drawn and revoked before it is completely executed. It would, therefore, seem that an arbitration might be upset in the course of the sittings. The only remedy for this anomalous power of conferring and revoking, is "some clear legislative enactment," and if economy and expedition in law proceedings are of any importance in the eyes of Parliament, the enactment cannot too soon appear among the statutes.

THE Council of the Cambridge Antiquarian Society are desirous to undertake the publication of a catalogue of the pictures, chiefly portraits, belonging to the University of Cambridge and the colleges, which should embody all the information attainable respecting the history of each picture. In many cases, however, this information is extremely defective. The correct names, both of persons and of artists, have been forgotten, or replaced by wrong ones, while several portraits preserved in different places profess to represent the same person, or to have been painted by the same artist, on evidence which is either manifestly erroneous or wholly insufficient. The council have come to the conclusion that the correct way to throw light upon these difficult questions would be to place side by side the pictures supposed to have been painted in a given period, and then to submit them to critical examination. They propose to begin with the pictures believed to have been painted before 1600 or 1650. Should the number belonging to the former period prove smaller than they believe it to be, and afterwards should the exhibition prove successful, they will proceed with the pictures belonging to later periods. It is manifest that those who possess these works will decline to lend them without a guarantee for their safe custody and proper exhibition in a building where they could be well seen and easily studied. It is suggested that no building is so well suited as the Fitzwilliam Museum. It is proposed that the pictures should be hung on screens in one or more of the principal rooms of the museum for a period of a month or six weeks during the Eastern term, the council of the Antiquarian Society to defray all expenses. The Museum Syndicate have approved of the scheme. All the arrangements are to be subject to the approval of the Syndicate.

It is well known that the late MR. BLANCHARD JERROLD had in hand a biography of his friend GUSTAVE DORÉ. It appears that a few months ago he came over to Paris with the object of adding to his materials, and applied to M. PAUL DALLOZ, the publisher and an intimate friend of the artist, who cheerfully supplied him with ample data. It is to be hoped that the materials collected may not all be lost through MR. BLANCHARD'S death.

THE publication of hand-books in connection with the Fisheries Exhibition was so successful, the experiment is to be again tried with the forthcoming Health Exhibition. Among the hand-books announced are the following:—"Measurements of Men," by Mr. Francis Galton; "A Manual of Heating," by Captain Douglas Galton; "Healthy Bedrooms and Nurseries," by Mrs. Gladstone; "The Dwellings of the Poor," by Miss Octavia Hill; "Healthy Villages," by Dr. Acland; "Principles of Cookery," by Mr. Septimus Berdmore; "Dress in Relation to Health and Climate," by Mr. E. W. Godwin; "Athletics," Part I., by Rev. E. Warre; Part II., by Hon. E. Lyttelton and Mr. Gerard F. Cobb; "Alcoholic Drinks," by Dr. Thudichum; "Non-Alcoholic Drinks," by Dr. Atfield; "Scavenging and Other Such Work in Large Cities," by Mr. W. Booth Scott; "Fire Brigades," by Captain Shaw; "Healthy Town Houses and Country Houses," by Mr. Eassie and Mr. Rogers Field; "Fruits of all Countries," by Mr. Thiselton Dyer.

## ILLUSTRATIONS.

BAUCIS AND PHILEMON.

WE give this week an illustration from one of the wall paintings at Wyfold Court, which represent some of the old Greek legends. The late Mr. HERMON, who gave the commission for the works, was a connoisseur whose discernment was almost infallible, and the immense prices realised by his collection of pictures was the best evidence of his sagacity. To be selected by such a man for the adornment of Wyfold Court is enough to mark the position attained by Mr. BRITTEN in decorative art. It will be seen from the illustration that the story has been depicted in a manner which is as much unlike that of the painter of an easel picture as that of the book illustrator. The figures and scenery have been kept flat, and are as low in colour as if the eye was only to glide over them. But while the subsidiary character of decoration is accepted with frankness, the artist has, in the painting, expressed the contention of the "fretful elements," what SHAKESPEARE calls "the to-and-fro conflicting wind and rain," in a most vigorous style. Landscape and figures are combined so as to produce effect in a way that is neither conventional nor commonplace. It is hard to say which is the more important, the pitiless storm or the two gods who have exposed themselves to its fury. Rags and drenching rain have not been able to destroy the dignity of JUPITER, while MERCURY, as becomes so practised an actor, appears to be more chilled than he is in reality. A decorative artist cannot restrict himself to one style, and the Wyfold Court pictures are very different in character from some other works which have been executed by Mr. BRITTEN. One of his latest—a frieze in a morning room in Lord LECONFIELD'S house in Mayfair, of which Mr. AITCHISON is architect—has for its subject the gambols of boys and dolphins. Notwithstanding the number of the figures and the length of the work, there is no monotony. Every action is infantile, a quality which does not always characterise some Continental works which have gained renown. Decorative art is not as yet appreciated in England as fully as it is abroad. A painter who devotes himself to that class of work must think of something more than financial profit, and is therefore entitled to the good wishes of all lovers of art.

The story which forms the subject of the painting relates to one of the adventures of JUPITER and his attendant MERCURY. OVID derived it from Greece, and something corresponding with it is found among the most ancient legends. The following extract from Mr. A. S. MURRAY'S "Mythology" will explain the illustration:—

Philemon and Baucis, an aged couple of the poorer class, lived peacefully, and full of piety towards the gods, in their cottage in Phrygia. Zeus, who often in disguise visited the earth to inquire into the behaviour of men, paid a visit, in passing through Phrygia on such a journey, to these poor people. He was received by them very kindly as a weary traveller, which he pretended to be. Bidding him welcome to the house, they set about preparing for their guest (who was accompanied by Hermes) as excellent a meal as they could afford, and for this purpose were about to kill the only goose they had left, when Zeus interfered. He was touched by their kindness and genuine piety, and that all the more because he had observed among the other inhabitants of the district nothing but cruelty of disposition and a habit of reproaching and despising the gods. To punish this conduct, he determined to visit the country with a destroying flood, but to save from it Philemon and Baucis, the good aged couple, and to reward them in a striking manner. To this end he revealed himself to them before opening the gates of the great flood, transformed their poor cottage on the hill into a splendid temple, installed the aged pair as his priest and priestess, and granted their prayer that they might both die together. When after many years death overtook them, they were changed into two trees, that grew side by side in the neighbourhood—an oak and a linden.

THE BUGHTIES, BROUGHTY FERRY.

THIS house, which has just been erected by Mr. W. H. FERGUSSON, stands on the hill called the Bughties (from which the house gets its name), to the east of Broughty Ferry. It commands a magnificent sea view, and of the mouth of the Tay and of Fifeshire.

The rubble and dressings are of red Camperdown stone, and the chimneys of red pressed bricks. The roofs are covered with brown tiles supplied by Mr. DOUGHTY, Ironbridge.

The building has been designed and carried out under the superintendence of Mr. J. MURRAY ROBERTSON, architect, Dundee.

EASTWOOD'S BUILDINGS, PARK LANE, LEEDS.

IN designing these buildings, the desire of the architects has been to gain a picturesque effect with simple and inexpensive means. With the exception of the piers between the shop windows, the heads and sills of the upper windows and the coping of the gables, both the fronts are carried out in red pressed bricks, some specially moulded to the details furnished by the architects being used for the strings, corbelling, &c. The upper storeys are planned for warehouse purposes, and are used for such.

HOUSES IN THE LOWER ADDISCOMBE ROAD, CROYDON.

THESE houses stand on a corner site in the main road of Addiscombe. Plans being given, no reference to the accommodation is necessary. Red bricks with cut and rubbed dressings have been used throughout, half-timber work being introduced in the gables and dormers. The work has been carefully carried out by Mr. WILLIAM MARRIAGE, contractor, of the Oval, Croydon, from designs by Mr. GEORGE FRISCH, A.R.I.B.A., 64 Cannon Street, E.C.

WESLEYAN CHAPEL, NEW ROAD, BROMSGROVE.

THIS illustration represents a view of the above church, now nearly completed, and to be opened on March 26. It occupies a commanding site on the New Road near the main entrance into the town of Bromsgrove, and undoubtedly forms an effective architectural ornament to the locality. The style adopted is sufficiently described by the illustration. The walls are brick relieved by Bath, Gressall, and local stone dressings and brick mouldings.

The main building comprises the chapel proper, providing an accommodation on floor and gallery of 450 sittings. In front are commodious lobbies containing gallery stairs, and at rear are the minister's and stewards' vestries, with passages leading through a covered way to school-room at back of site, which is constructed to accommodate (with class-rooms) 300 children.

The total cost (inclusive of site) is about 3,000*l.*, and the works have been creditably carried out by Mr. JOSEPH TILT, contractor, Birmingham Road, Bromsgrove. The internal fittings are by Mr. SAMUEL MEAD, church and school furniture manufacturer, Sparkbrook, Birmingham. The architect is Mr. F. J. YATES, of 1 Colmore Chambers, Newhall Street, Birmingham.

## EX PARTE ARBITRATIONS.

AT the desire of some correspondents we print the judgments of the Master of the Rolls and Lord Justice Bowen, which were referred to in Mr. Appleton's letter, published on the 8th inst. The case before the Court of Appeal was *Fraser & Co. v. Ehrensperger and Another*, and although it did not relate to building, the judgment is applicable to arbitrations in which architects are concerned. It appears that a contract had been entered into between the parties for the delivery of a cargo of rice. As the cargo was not shipped, the plaintiffs demanded an arbitration, to ascertain the amount of damages. There was a clause in the contract-deed, by which a dispute was to be referred for settlement to the arbitration of two London brokers or their umpire, one nominated by the sellers, and the other by the buyers, each party having the right of rejecting one nominee. Messrs. Ehrensperger disputed their liability on the grounds that they signed merely as agents, and that the sale was conditional on the arrival of the cargo. They proposed to state a special case to obtain the opinion of the Court. This proposal was declined. The plaintiffs gave notice that they had appointed an arbitrator, and that if the defendants failed to appoint another, the arbitrator named by Messrs. Fraser would proceed alone under section 13 of the Common Law Procedure Act, 1854. Immediately afterwards Messrs. Ehrensperger gave notice to the plaintiffs that they revoked, annulled, and made void the power and authority which had been given under the agreement to the arbitrators, and that they discharged and prohibited the arbitrator named from making any award or from any further proceeding in the intended arbitration. A corresponding notice was sent by them to the arbitrator. A second notice was served by the plaintiffs on the defendants stating that the nominee would act as sole arbitrator, and the next day the arbitrator was reminded by

the defendants of the previous notice, and the prohibition was repeated. The arbitrator proceeded with the reference *ex parte*, and awarded the plaintiffs damages amounting to 1,239*l*. The submission was afterwards made a rule of court, and application was made to enforce the award.

The case came before the Queen's Bench Division, and the application was refused, but without costs. The Court held that Messrs. Ehrensperger & Co. had the right to revoke the authority of the arbitrator. That authority was derived from the agreement of both parties, and was accordingly revocable at the option of either. It was held that the Common Law Procedure Act, 1854, was not intended to extend the operation of 3 & 4 Will. 4, c. 42, s. 39, or to take away the common-law right to revoke the appointment of an arbitrator in a case not within the provisions of the latter statute. The plaintiffs appealed; but it will be seen from the judgments given below that the Court of Appeal took the same view as the Queen's Bench Division.

The Master of the Rolls said: In this case a dispute arose between the two parties to a contract. That contract contained a clause providing for an arbitration under the Common Law Procedure Act, 1854, in case such a dispute should arise.

Section 13 of that Act is the section which applies to this case, and that section provides that when the reference is to two arbitrators, as was the case here, if, on such a reference, one party fail to appoint an arbitrator—and that is what happened in this case—the party who has appointed an arbitrator may give the other party notice, and may then appoint the arbitrator to act as sole arbitrator in the reference. This was done in this case, and the sole arbitrator heard the evidence; but before he made his award, the defendant, who had failed to appoint an arbitrator, revoked the authority of the sole arbitrator, and gave him notice not to proceed with the reference. The arbitrator, however, did proceed, and made what he intended to be an award, and it is this award which the Court is now asked to enforce. The question is, whether such an award is an award in law, for if the submission was legally revoked, then there is no award which the Court can enforce.

It was urged on behalf of the appellants that as section 13 of the Common Law Procedure Act, 1854, enables one party to a dispute to name a sole arbitrator, therefore the party so nominated is not the mandatory of both parties, but only of the one who nominates him, and that the person so named is in fact a judge and not an arbitrator, that the matter brought before him is brought for judicial decision, that what is given is a judgment, and that the authority of this judge cannot be revoked. I cannot think that this argument ought to prevail. Judges are well known persons, with well known characters and positions; they are nominated in the authorised way to act as judges between all suitors; they are not persons nominated to decide matters between two particular persons or sets of persons. An arbitrator, however, is a person who is appointed by agreement to settle matters in dispute between two specified parties; an arbitrator is clearly not a judge, and he is, on the contrary, a mandatory, his authority issuing entirely from those persons who agree to give that authority to him. It has not been denied that if each of two parties appoints an arbitrator, either of them can withdraw the mandate from his own arbitrator; but it is argued that in a case such as the present the provisions of the Common Law Procedure Act, 1854, s. 13, alter the law. That must depend upon the question whether an arbitrator appointed under that Act is an arbitrator having the attributes of an arbitrator, or whether he is something else, and whether or not he is subject to the usual incidents which attach to an arbitrator. I am of opinion that he is an arbitrator appointed to act between the parties in the manner in which any other arbitrator would act. The Common Law Procedure Act, 1854, only interferes with the manner of his nomination, and therefore his authority may be revoked; and he is, I think, a statutory mandatory appointed by statute to act for both parties, and therefore either can revoke his authority within the proper time. It has been said that the judgment of Lord Chief Justice Bovill in *In re Rouse and Meier* is correct, and that the reasoning of that judgment supports the case of the appellants, and it is said that section 7 of the Common Law Procedure Act, 1854, incorporates the provisions of section 39 of 3 and 4 Will. 4, c. 42, in such a way that neither party can revoke the authority of the arbitrator. Without doubt the appellants must succeed if the view taken by Lord Chief Justice Bovill be correct. We can, it is truly said, review the judgment of the Court in *In re Rouse and Meier*; but I own that, even if I dissented from the judgment of the Court in that case, I should hesitate to overrule it. That judgment contains a decision on a rule of procedure which was brought thus before the public, the profession, and the Legislature several years ago; it has been acted on, the subject has been dealt with in statutes and rules of Court, and yet the rule has not been altered or abrogated. I maintain, however, the opinion which I expressed in that case, and I think that section 7 applies only to what the arbitrator can do and what the Court can do, and not to what the parties may do, and that it does not incorporate into the Act the enactments of the earlier statute affecting the power of the parties to revoke the arbitrator's authority. It has been further urged that section 13 of the Act of 1854 prevents the parties from revoking the authority of

the arbitrator; but I adopt the reasoning of the decision in *In re Rouse and Meier*, and I think that it is an incident which is affixed to the appointment of an arbitrator that he is a mandatory, and that where he is appointed to act between two parties he is the mandatory of both: so that before the mandate is completely executed it can be withdrawn and revoked, unless there is some clear legislative enactment which takes this power away from those who confer the authority on the arbitrator. I find no such words in section 13 of the Common Law Procedure Act, 1854, and I am, therefore, of opinion that that section does not take the power away. I think that the cases referred to support this view, which is that adopted in the judgment of the Divisional Court, and this seems to be especially true of the judgment of the late Master of the Rolls in *Piercy v. Young*.

Lord Justice Bowen said: I am of the same opinion, and I agree that this appeal must fail. At common law the case is clear, and I think that an arbitrator appointed under the Common Law Procedure Act, 1854, has not a statutory and indefeasible function to bind both parties by his award, if either of them revokes the authority in time. Section 13 does not give him this, although it makes him in certain circumstances the mandatory of both parties. Nor does the latter part of the section alter his position; that provision enables a party to go to the Court in certain circumstances without attempting to revoke the submission. The judgment of the Court in *In re Rouse and Meier* shows that the provisions of section 39 of 3 & 4 Will. 4, c. 42, do not govern such a case as this.

### THE BELT CASE.

ON Monday last judgment in the case *Belt v. Lawes* was delivered in the Court of Appeal by the Master of the Rolls, Lord Justice Baggallay, and Lord Justice Lindley. Their Lordships were unanimous in favour of the plaintiff, and were of opinion that the damages given by the jury at the trial, amounting to 5,000*l*., with all the costs, should not be disturbed. The following remarks of the Master of the Rolls on the relation between an artist and his assistants merit attention:—The libel attacks the plaintiff in his character of a professional sculptor. It was admitted that it accuses him of mean, dishonourable, and dishonest conduct as a professional sculptor, and I think of such conduct habitually and up to the time of the accusation. By what standard is the truth of those accusations to be tried? I answer by the standard which the majority of careful, simple, honest-minded men of ordinary intelligence and ordinary sensitiveness of right and wrong will apply. Such accusations are not to be determined by the sensitive delicacy of a high-minded profession, which is often too sensitive. It is not to be determined by a puritanism of honour, which belongs sometimes to minds of the highest order. It is to be decided by the ordinary standard of honour of ordinary honourable men. If that be so, I know of no tribunal, I will not say superior, I will say equal to an honest jury of twelve men of something like the social quality of the accuser and the accused. The mind of a single man may be too high-pitched, the minds of men of a different class might be too low-pitched; but the concurrent opinion of a jury reasonably and fairly selected is probably safe. What we have now to see is what view such a tribunal might not unreasonably take of this case. The charge is that the plaintiff had made use of assistance in sculpture, more especially in cases where he has sent in models by way of competition with other sculptors for an order for works, to an extent and in a manner which was mean, dishonourable, and dishonest. It is necessary to bring one's mind clearly to the conception of what men of ordinary honourable feelings might consider a kind of, or an amount of, assistance which would be mean, or dishonourable, or dishonest respectively. 1. With regard to whom or to what would the assistance, however great, of skilled helpers paid for their skill be dishonest in the case of such a person as the plaintiff. It is not dishonest towards the persons employed and paid. It makes no difference to the purchasers—none to competing artists. It is difficult to see whom it cheats or defrauds, or in what respect it is an injurious fraud. Is one then bound to say it is dishonest? 2. Would the use of more assistance than other sculptors usually accept be of itself mean or dishonourable? I say certainly not if it were used with an innocent mind. I abhor the idea of stigmatising a man as mean or dishonourable unless he has a mean or dishonourable mind. If there was too much assistance—if more than usual assistance, whether at the beginning or end of the sculpture, is accepted or hired, though such assistance be a breach of professional etiquette, I am of opinion that men of ordinary honour might refuse to consider such conduct to be either mean or dishonourable in the sense of this libel, if it were only the result of ignorance, or idleness, or negligence, or even of a wilful disregard of mere professional regulations. Men of ordinary honourable feelings might refuse to class the suggested conduct as mean or dishonourable unless the person accused adopted the suggested conduct from a mean motive, or with a dishonourable intention, or pursued such conduct in an intentionally mean, degrading, and deceptive manner. If,

therefore, it can be said that the defendant proved by evidence, which ought to be conclusive that the plaintiff had accepted more than usual assistance, or more assistance than professional artists usually accept, or more than is understood to be allowed by the regulations of his profession, it seems to me that a reasonable jury might refuse to find such conduct to be either mean or dishonourable, unless the plaintiff had further proved by evidence which ought to be conclusive that the plaintiff accepted such assistance from a mean motive, or with a dishonourable intention, or used such assistance in an intentionally mean, degrading, and deceptive manner. And I take it that it is in the latter sense that the defendant has accused the plaintiff, both in the libel and in the evidence brought forward to prove the justification. If the evidence ought to be considered to have conclusively proved that the plaintiff did habitually allow Verheyden to design and execute the sculpture for which the plaintiff took credit as his own, and at the same time, in order to obtain personal fame, which he felt he did not deserve, hid Verheyden in the ludicrous manner which Verheyden describes, I cannot hesitate to say that his acts were mean and dishonourable, because his mind would be mean and dishonourable, and the jury ought to have said so. But if the evidence failed conclusively to prove this, even although it was proved conclusively that the plaintiff accepted more assistance than is recognised as legitimate in his profession, yet as it has failed to prove that he did so meanly or dishonourably, then the verdict cannot be set aside as against the weight of the evidence. It was urged on behalf of the defendant that our consideration ought to be confined to the question whether the plaintiff could design and execute works of artistic merit, and that we ought not to consider the question whether he could or could not perform some part of the work of a sculptor. In one sense that is so, as the counsel for the plaintiff at the trial declined to accept a verdict that he could do some work, but that he could do no artistic work, and that he knew he could not, and that by mean and unworthy expedients he endeavoured to conceal his deficiency. Of course he did; but in order to induce the jury to come to the conclusion that the plaintiff could do no work of artistic merit, and that he knew he could not, and therefore endeavoured to conceal his deficiency, the libel alleged, and the witnesses for the defendant intended to prove, that the plaintiff could not do any substantial part of the work of a sculptor-artist. And though the plaintiff would not willingly accept a verdict that he could only do some part of the work of an accomplished sculptor, the jury were entitled, and the Court is now bound, in weighing the amount of credit to be given to conflicting evidence, to consider that some of the defendant's witnesses intended to discredit the plaintiff to the fullest extent. If Verheyden, for instance, intended to swear that the plaintiff could not perform even the rudest part of a bust, and the plaintiff proved to the eyes of the jury that he could, the jury were entitled to consider whether Verheyden could be a truthful witness when he denied to the plaintiff the power of finishing a valuable bust.

#### EDINBURGH ARCHITECTURAL ASSOCIATION.

A meeting of the Association was held in the Professional Hall on the 10th inst., the President, Mr. David MacGibbon, in the chair. After some preliminary business had been disposed of, and after several gentlemen had been balloted for and admitted to the membership of the Association, the President called upon Mr. W. W. Macfarlane, who then read a paper, entitled "Some Notes, Thoughts, and Sketches on the Decorative Arts à Pot-pourri," in which he endeavoured to show that good decorative work was not necessarily the outcome of lavish expenditure. Hints were given as to some simple and artistic modes of treating the interiors of town houses. The decorations and furnishings of an ideal bedroom were sketched, and other topics of importance in decorative matter discussed. Mr. Macfarlane thought that a practical demonstration in the use of colours, &c., would be of much more value than essay reading, and expressed his willingness to give this at some future time, provided a subject could be procured, and the necessary daylight. The paper was illustrated by numerous sketches. At the conclusion of the paper a vote of thanks was awarded to Mr. Macfarlane.

#### ARTISANS' DWELLINGS IN GLASGOW.

THE closing meeting of the architectural section of the Glasgow Philosophical Society was held on Monday. Mr. James Sellars, president of the section, occupied the chair. A brief discussion took place on the paper read at a former meeting by Mr. John Dansken, entitled "Notes on the Fire-resisting Properties of the Leading Building Materials." The President delivered the closing address, in the course of which he reviewed the work of the session. Referring to the paper read by Mr. Honeyman on "Free Spaces in Densely-populated Districts, and how to obtain them," he said that it had a direct bearing on the subject which was agitating the country, namely, the dwellings of the poor.

How to supply healthy houses for the class who lived in hovels in the lowest slums was the question which had to be considered now. The Royal Commission which was now engaged inquiring into the subject would, he trusted, be able to throw some light on it. He understood it had been suggested to the Commission by a well-known authority in Glasgow that among the first things they should inquire into were the existing laws or restrictions which prevented the erection of suitable houses for the very poor. There was not the slightest doubt that in Glasgow it would be impossible, under the restrictions sought to be obtained in the new Police Act, to erect houses for the poor at a cost which would permit of them being let for a rent which that class of persons could pay. They must have something like free trade in house building if they were to provide for the very poor. The restrictions, if they existed at all, must be of the most elastic kind, and even then the cost of the ground would be a serious difficulty. Mr. Honeyman, in moving a vote of thanks to the President, said he was extremely glad that Mr. Sellars had taken that opportunity of uttering another protest against unnecessary restrictions which stood in the way of houses for the very poorest classes being erected here and elsewhere. On the motion of Mr. Landless, Mr. Sellars was re-elected president. The proceedings were afterwards brought to a close.

#### THE DESIGNS ON COINAGE.

THE first of a series of Cantor lectures was given on Monday at the Society of Arts by Professor Chandler Roberts, of the Royal Mint. In the course of it the methods adopted by the Greeks in striking coins and the casting of coins as conducted in late Roman times were indicated, while more recent plans were illustrated by cutting discs of metal, by means of an appliance formerly used in the Mint in the Tower of London, and by striking them by a press devised in the Paris Mint early in the present century. Professor Roberts said it had often been contended that art had suffered serious loss by the replacement of old hand-struck money by coins struck by machinery. It was, therefore, not a little remarkable that the artists who were connected with mints appear to have been the very people to insist on the introduction of mechanical improvements. For instance—to take only the comparatively well-known names from those mentioned—Benvenuto Cellini described, in 1586, the screw press which, in a form modified to enable it to be worked by steam-power, has only just been abandoned in the Mint in this country. Leonardo da Vinci, as Dr. Richter has recently shown, devised in 1515, for use in the Mint at Rome, a method of cutting out discs of metal for coinage, which was a great advance on the crude methods employed in the sixteenth century. Briot, Engraver-General of the Paris Mint, invented a machine, used in this country in the reign of Charles I., which depends upon a principle definitely adopted in the new lever-coining presses now at work; and his pupil, Simon, the best engraver England ever had, employed an elaborate mechanical contrivance, which enabled him to produce one of the most beautiful coins known. In order to meet the objection that the artistic side of minting was hardly within the province of the chemist, Professor Roberts quoted Biringuccio, one of the greatest of the early metallurgists, whose advice to the Mint Master, written in 1540, might be briefly stated as follows:—"If the coins are very accurate as regards 'standards of fineness,' but small profits can be made; while, if too much base metal is introduced, the execrations of the people will follow; but especial care should be devoted to the preparation of the dies for striking artistic coins, so as to give the people pleasure in things they are obliged to use."

#### THE STONE CIRCLES AT STANTON DREW.

AT the last meeting for the session of the Bath Natural History and Antiquarian Field Club, Mr. Allon Tucker read a paper on "Stanton Drew." Prefacing his paper by remarking that so much had been written on the subject that there was little room for originality, he, in the first place, touched on the meaning of the word Stanton, of which there were many examples in the manor of Keynsham, and then of the other word Drew, which of course had no reference to the so-called Druids, but was of quite a different origin. He then gave a description of the stone circles, and the various other stones scattered about—their position, size, and composition—and concluded by bringing in review the various suggestions of the purposes for which they were erected.

Mr. Dymond, who had written papers for the Proceedings of the Somerset Archaeological Society and the Archaeological Association on these circles, and was called on by the chairman, the Rev. Canon Ellacombe, to give his views as one well versed in the subject, said that he quite corroborated Mr. Tucker's view that the Cove had never been a Dolmen, and that the third stone now fallen could never have been a top covering stone. He considered that very little change had occurred in the position of the stones since Aubrey's time, and that he had, with Mr. Perfect, accounted

for all of them, making a total of sixty-six in number. As to the purposes for which they were placed, he thought that in addition to an original religious use, they subsequently developed into uses judicial as well as funereal.

The Rev. H. H. Winwood having been called on by the chairman, said that he congratulated the club that one of their younger members had given so careful and judicious a paper, merely stating the plain facts of the case without launching out into any fanciful theories. With regard, however, to one point he must demur. Mr. Tucker had spoken of one of the stones being "limestone," and having a "shell" in it. Now he thought it would be safer to say that they were all a conglomerate. He had never seen any one of the stones there that could be called a "limestone," and as to the shell he challenged Mr. Tucker to show him one. They probably came from the neighbourhood, and were a peculiar form of the conglomerate which fringed our Mendips. At the same time, it was an object worthy of the members of the club to try and ascertain whence these stones came; they were probably not far off. One other point—as to their future preservation. He stated that during a recent visit there with General Pitt Rivers, the Government Inspector of Ancient Monuments, arrangements were made for their future security, and they were in the process of being scheduled amongst the other remains in the county worthy of preservation.

The chairman returned the thanks of the club to Mr. Allon Tucker for his paper, and the judicious restraining of his fancy from going into theories. As to the name of Drew being derived from a family of that name, he would mention one fact in corroboration. Drew Steignton, a well-known place in Devonshire, was the same name slightly altered, and records show that a family of the name of Drew, who lived in Exeter, was connected with that place. There was yet another derivation he could venture to give. Drew was the old name for a stream, and the little river Chew ran close alongside. The word was to be found, but somewhat hidden, in the word Derwent. "Stanton," he thought, was connected more with a Roman station than a paved road; the word "Stratton" was more likely to suit the latter idea. The remains nearest allied to this were the standing stones of Stainness (a stony promontory instead of a stone village or town). There was a Maes How near Stainness as there was a Maesbury near Stanton; and moreover there was a single stone corresponding with "de Hauteville's quoit." In conclusion, he ventured upon some theories of his own as to the date being post-Roman, and said his views were held by others whose opinion was of weight in these matters.

#### Design Piracy.

SIR,—A few years back you were good enough to illustrate, in a beautiful photo-lithograph, from a photo, my original design for the Durham Cross, erected at Fence Houses, Durham. In a building journal of recent date I find my design, line for line, detail for detail, published as a memorial cross to Lord Frederick Cavendish, by Messrs. Lockwood & Mawson, architects, and executed by Messrs. Farmer & Brindley. With distinct purpose my design was a copy of no ancient example. In this Cavendish Cross there is not a distinctive peculiarity of my design which has not been adopted. Possibly the Durham Cross has been reproduced by request, but I am amazed that in ordinary courtesy any architects would permit the reproduction to be stated in all the public prints, the reproduction of another man's design, simply, purely, as their own.

Yours faithfully,  
THOMAS DREW, R.H.A.

#### The Reform of the Institute.

SIR,—The gentlemen who are clamouring for a rival to the Institute do not show the sagacity of their countrymen, a sagacity which has kept England free from many of the troubles that have afflicted other nations.

The Institute has now been in existence nearly fifty years, and till comparatively lately has had but a struggling existence. It is more or less known to the public and to foreign architects, it is beginning to exercise a beneficial influence on public opinion, to be consulted by the Government when it wants to know the opinions of the profession, and it is generally admitted to have raised the position of architects. Is the profession so powerful and independent that it needs no aid? Are its members so wealthy and so highly esteemed that they can always dispense with corporate assistance? My conclusions lie in the opposite direction. It seems to me that all who now stand aloof should enroll themselves in the ranks of the Institute, and thus form a powerful and organised body to act in case of need, and to prevent isolated re-

sistance from being overcome, rather than lessen the little corporate power we have by schism.

If there are grievances they can be clearly stated and temperately argued, and I should think if found to be real must certainly be redressed, for every member who fulfils any duty does it purely for the benefit of his profession; he gets neither pleasure nor profit. Want of space, want of time, and want of funds check many improvements that are needed. Could a lowering of the subscription be afforded, it would doubtless increase the number of the members.

We have no parliamentary representative, so every possible architectural work is given by the Government to a military engineer or to the Board of Works. It would be interesting to know what the percentage on the outlay is at the Board of Works, if the real cost of design and supervision could be known, if we knew the present value of the land on which the offices are built, what the rent and taxes would come to, and what the expenses, salaries, and the like really are. I am told that in India these amount to 200 per cent. in the Public Works Department, *i.e.* that when all works are stopped only one rupee is saved out of three, yet when independent architects are employed by Government, the ordinary starvation pay of 5 per cent. is refused. Were the architects a powerful body these abuses would be stopped.

150 Harley Street, W.: GEORGE AITCHISON.  
March 19, 1884.

#### WORKS IN PROGRESS.

**The Contract for Lifts** for Messrs. Silber & Fleming's new premises, Wood Street, for which Messrs. Ford & Hesketh are the architects, has been placed with Messrs. R. Waygood & Co., Newington Ironworks, Falmouth Road, S.E., who have received instructions to supply one of their patent hydraulic balanced passenger lifts, two direct-acting platform basement hoists, one goods lift, and one hydraulic warehouse crane, all to be worked by water supplied from the General Hydraulic Power Company's high-pressure mains.

**The Brighton Aquarium Concert Hall** has been brilliantly illuminated nightly for the past three months by the "Bower duplex regenerative gas lamps," as fitted by Mr. J. Coley Bromfield, consulting engineer, of 49 Selborne Road, Hove, Brighton. The steadiness and brilliancy of the light has excited the admiration of all who have seen them, whilst the small quantity of gas required to produce such an intense illumination appears to most people incredible. This extraordinary new light will be exhibited nightly at the Building Exhibition.

**Mr. R. Adams**, whose new offices and show-rooms are at 17 Blackman Street, Borough, S.E., has received the order for his patent secure fanlight-opener for the whole number required—which is very large—in the new and extensive office buildings in Burge Yard, Queen Victoria Street, of which Mr. Whichcord is the architect. Mr. Adams's adjustable fanlight-opener, and also his spring hinges, are being extensively used by Messrs. Colls & Son at their new buildings in Fenchurch Avenue, Lime Street, E.C. The fanlights in the latter are large, and, being made of iron, with heavy plate-glass, require an opener, closer, and fastener that is perfectly safe and capable of being worked by clerks and inexperienced persons. For such requirements this opener is pre-eminent, as the screw by which it is worked is not only the neatest arrangement we know of, but is guaranteed against accidents, and does its work easy.

**Mr. Charles D. Phillips**, Emlyn Works, Newport, Mon., has just completed the covering of a large new blast-engine house at the Ebbw Vale Steel, Iron and Coal Company's Works, at Victoria, with his new patent double grip lock-jaw roofing tiles. It is in a particularly bleak situation, and the roof has proved itself to be most effective, ornamental, and economical. Mr. Phillips is also supplying the tiles for covering some roofs for the Right Hon. Earl of Shaftesbury. These tiles are rapidly growing into public favour, and a large quantity of them are continually being used in the neighbourhood of London.

**The Covent Garden Hotel**, Southampton Street, Strand, has been redecorated, Messrs. Rottmann, Strome & Co.'s leather paper being introduced for the wall decorations.

**Messrs. Andrews & Co.'s** improved system of wood-block flooring is being extensively specified for hospitals, churches, schools, and other buildings in various parts of the country. This system possesses an undoubted superiority in having the blocks "keyed" firmly to the cement bed underneath, rendering it an impossibility for them to become loose, and doing away with the hitherto well-founded objection to these floors—the liability of the blocks kicking up. Now that this drawback has been remedied we have no doubt that wood-block floors will be more generally adopted, as they are in every way to be preferred to the ordinary floors, being free from echo and very durable. The blocks used by Messrs. Andrews & Co. are thoroughly seasoned and undergo a chemical process to render them impregnable to dry rot. They are laid so that damp cannot rise from beneath.

## LEGAL.

**Queen's Bench Division.—March 19.**

(Before Mr. JUSTICE HAWKINS.)

FELIX Z. GORDON.

AN EXPENSIVE SIDEBOARD.

The plaintiffs in this case were upholsterers in Charles Street, Soho, and also in Paris. The action was to recover 100*l.*, a balance said to be due as part of the price of a sideboard which the plaintiffs had made for the defendant.

The case for the plaintiffs was that in the spring of 1882 the defendant wanted a sideboard for his dining-room, and desired the plaintiffs to make a sketch from three drawings which he sent them. It was agreed that they should make the piece of furniture for about 130*l.* It was said, however, that there was afterwards some alteration in the design, in respect of which 20*l.* was paid, and especially that the ornaments, which were to have been moulded from carton-pierre, were instead carved in mahogany, and afterwards enamelled to give a sort of ivory surface. It was said also that the enamel could be better applied to the wood than to the other material. This increased the cost of manufacture, and the price that the plaintiffs charged was 230*l.*

The case for the defendant was that the cost was to be 130*l.*, and this sum he had paid, leaving the extra 100*l.* in dispute. It was further said that 130*l.* was enough to compensate the plaintiffs for the work that they had done.

The jury, having considered the matter for half an hour, gave their opinion that the sideboard was worth 155*l.*, and a verdict was entered for the plaintiffs for 25*l.* beyond the 130*l.* which had been paid.

## ART WORKMANSHIP.

**Gloucester.**—A faculty for the reredos to be erected in the St. Catharine's Church, Gloucester, has been granted. The reredos has been designed by Messrs. Medland & Son, of Gloucester, architects of the church. The reredos is in the form of three panels, with canopies, which will be executed in Caen stone. The back of the central panel will be diapered, and beneath the canopy will be a brass cross. In each of the side niches will be the figure of an angel in adoration, and the reredos will be supported on either side by a small stone buttress. Alabaster and small Devonshire marble columns will be used, and the work promises to be very effective. The present vestry of the church is to be taken down, and a new and larger one built, on a plan to allow it hereafter to be used as the base for a spire to the church.

**Whitley.**—The large west windows of Christ Church have recently been filled with painted glass, the cost of which has been defrayed by an anonymous donor. The designing and execution of the work were entrusted to Messrs. Westlake & Co., of Endell Street, London. The subjects of the windows are devoted to the Incarnation, and illustrate the earlier scenes in our Lord's life, together with the types which foreshadow them. There are three rows of figures in each window. In the central and upper rows of the window on the south side there are representations of the Annunciation, the Adoration of the Magi, and in the lower row appear the types predicting this event, the manifestation of Jehovah to Moses at the Burning Bush, and the visit of the Queen of Sheba to Solomon. On the north side the central figure is the Presentation of Christ in the Temple, and above it the Baptism of our Lord. In the lower series the Old Testament types are the presentation of Samuel to Eli, and the passage of the Israelites through the Red Sea. In the tracery there is a representation of the infant Saviour and the Virgin, with angels in adoration. The style of the details of the windows is that which prevailed in the fourteenth century.

## ARCHÆOLOGY.

**The Archæological Survey of India.**—The sixteenth volume of reports of this department has been recently issued from the Government Press at Calcutta. One of the most interesting discoveries recorded on the pages is that of another Asoka pillar at a village on the frontier of Nepal. Although the figure of the lion forming the capital of the monument has been so damaged that only the paw or foot remains, there is sufficient to show that originally it must have been similar to the beautiful lion-pillar still standing at Lauriya. It is not certain for what purpose these pillars were erected; but it seems probable that they may have been raised to mark the high route to Nepal and the Himalaya, or to celebrate some famous march in history. They are all found along the principal road north of Patna. The artistic excellencies of the earlier pillars are far superior to the later ones. It seems more than probable that they were due to the influence and co-operation of Greek art, which completely ceased after the overthrow of the Bactrian dynasty. General Cunningham also gives a brief account of the Kauwa Dol or Crow's Rocking-stone, a ruined

column on the top of a hill which is now proved to cover the site of the famous Silabadhra monastery, visited by Hwen Thsang in the seventh century. The Archæological Survey is still doing the good work commenced by the efforts of individuals like Kirkpatrick and Brian Hodgson.

**The Manor House, Chelsea.**—In making some excavations in ground formerly attached to the Manor House at Chelsea, built by Henry VIII. as a residence for his daughter, the Princess Elizabeth, the workmen came upon probably the only portion existing of a historically-known subterranean communication leading northwards from the three great houses—Manor House, Winchester Palace, and Shrewsbury House—in the direction of Kensington. The great leaden ducts constructed by Henry VIII. to supply Winchester Palace and the King's New Manor House with water, from a conduit built by him in the grounds at Kensington, had already been found, and removed as obstacles to building. Remains of the ancient crucible works for gold refining, and the Chelsea china works, both in close proximity, had also been dug up, but this curious passage was not known to have any existing remains. About 30 feet of it, in good preservation and carefully arched, have now been uncovered.

## CHURCH BUILDING AND RESTORATION.

**Plymouth.**—The Presbyterian church, Wyndham Street, has been reopened after restoration, necessitated by the fire which occurred fifteen months ago. Beneath the chapel, as before, there is a spacious schoolroom, to which five new class-rooms have been added on the east side; and the space formerly occupied by class-rooms at the end has been thrown into the main room. The architect for the restoration was the architect of the original building, Mr. J. L. Hodge, of Courtenay Street, Plymouth; the contractors were Messrs. Palk & Partridge; Mr. Rowe, of Old Town Street, supplied the gas fittings; Messrs. Randle & Prowse, of Courtenay Street, were the painters; and Messrs. Harding & Sons, of Union Street, were the upholsterers.

**South Gosforth.**—The memorial-stone of a Wesleyan chapel has been laid. The plans have been prepared by Mr. J. J. Lish, Newcastle-on-Tyne, for a handsome building with spire and galleries, though the spire and galleries are parts of the project which will not be immediately carried out. The cost of the building, so far as it is this year intended to proceed with it, will be about 3,000*l.*, and for that sum accommodation for 450 persons will be provided.

**Monkswood.**—Monkswood church, Monmouthshire, has been opened. It is built with hammer-dressed local stone, relieved by Westwood ground dressings, and the roofs are covered with silver-grey slates. The style is that of the early part of the fourteenth century, accommodation for 136 worshippers being provided, at a cost of about 1,000*l.* The fabric consists of a nave, 35½ feet by 19½ feet, with double bell-turret at the west end and an open-timbered porch on the south side; a chancel, 22½ feet by 13½ feet, screened off from the nave by a dwarf wall, and having lofty arch, with sub-arch, supported on red Mansfield responds; and vestry, 11 feet by 8 feet, leading from chancel on the north side. The cathedral rolled glazing was supplied by Mr. Ben Gay, of Bristol, the carving by Mr. J. T. Davies, of Brynmawr. The architect was Mr. E. H. Lingen Barker, of Hereford; and the builder, Mr. E. Giles, of Little Mill.

**Market Rasen.**—The safety of the old tower of St. Thomas's Church has lately been a subject of consideration. The upper portion has been found to show signs of rapid decay and imminent danger. On the top several iron ties were found to be loose, and some of the stones might be separated by the hands. In the bell-chamber the mullions and transoms of the windows on the east, west, and north sides are in a dilapidated and dangerous condition. The vicar has considered it advisable to discontinue the "ringing up" of the bells, and to call in some competent person to give an opinion as to the best course to be pursued, and the name of Mr. Kirk, architect, of Sleaford, has been suggested. The fine old tower is from 60 to 70 feet high, is strongly buttressed, and is believed to be about 600 years old. After the tower has been inspected an appeal will be made for pecuniary help.

## SCHOOL BUILDINGS.

**Stoke-upon-Trent.**—A monthly meeting of the School Board was held recently. Mr. Kirkham moved that Mr. Charles Lynam be instructed to prepare plans for the new school and superintend the erection, at a commission of 3 per cent. The Rev. H. C. Turner seconded. Mr. Ford intimated that Mr. Beardmore, architect, would undertake the work at 2½ per cent., and he consequently objected to the payment of 3 per cent. to Mr. Lynam. He proposed that the matter should be adjourned until the next meeting, and the subject then placed upon the agenda. Mr. Walley seconded this amendment. Mr. Minton observed that an architect would probably take the work at even less commission than 2½ per

cent. so as to get a connection with a public body. Mr. Lynam had served the Board well for thirteen years, and at a fair marketable price; and he saw no reason why the Board should change. Mr. Ford said that some of the members were absent from the meeting, and he should object to the appointment being made in a hole-and-corner way. The Chairman said he must protest against this latter remark, seeing that the consideration of the minutes of the Building Committee was mentioned upon the agenda, and the matter was ready for the Board's decision. The amendment was defeated by four votes to three, as was also a further one, moved by the Vice-Chairman, seconded by Mr. Walley, that the services of an architect be advertised for, the original motion being carried.

**Little Hulton.**—An appeal has been issued for support towards the proposed new church schools. There are at present 400 scholars upon the register of Peel School. Plans prepared by Mr. R. K. Freeman have been approved by the Education Department. Arrangements have been made for entering into a contract with Messrs. Coope Bros., of Farnworth, to erect the buildings, offices, &c., for the sum of 2,180*l.* 10*s.* This sum is exclusive of the architect's commission, the cost of furnishing and fitting-up, &c.

**Wolstanton.**—The memorial-stones of new Sunday Schools, to be erected at the rear of the Primitive Methodist Chapel, Wolstanton, have been laid. The schools are designed to accommodate over 300 scholars, and will cost nearly 400*l.* The building contract has been taken by Mr. F. Seabridge.

### NEW BUILDINGS.

**Organ Manufactory, Kendal.**—Messrs. Wilkinson and Sons, of Kendal, are about to erect a large organ manufactory, pianoforte saloons, offices, &c., and residence. The available floor space for business purposes will be over 9,000 feet, and when complete will be one of the largest buildings of this class in the north of England. The design will be Gothic, freely treated; freestone dressings will be used to front elevations, and the works will be entered by a handsome porch with deeply moulded arch and granite columns. The entire frontage of the whole block will be 170 feet, which will face the river Kent, and will form a nice feature in the centre of the town. The plans have been arranged and the designs made by Mr. Eli Cox, architect, of Kendal.

**Hall at Plantation, Glasgow.**—The new hall erected in Cornwall Street, Plantation, by the Plantation U.P. congregation has been completed. The buildings are erected on a piece of ground on the south side of the church, and cover an area of about 400 square yards. The hall is 40 feet by 54 feet, and is ceiled at the collar beam, 25 feet from the floor. Four bound couples carry the roof, which are supported by semicircular and moulded ribs, springing from stone corbels and tied with malleable-iron tie rods and queen-rods. There is an end gallery, seated for 100. On the ground floor of the front building there are two class-rooms, the one 15 feet 6 inches by 21 feet 6 inches, the other 15 feet 6 inches by 10 feet, with kitchen and lavatory accommodation. The second story is devoted entirely to the officer's house, which contains four apartments. The stair to this house, is also used as the stair to the gallery. Jutting out from the main building at the platform end a small side-room has been erected for the accommodation of the speakers and others. The forms are portable and in short lengths, and are convenient to arrange for Sabbath school, mission, concerts, and the various purposes for which the hall has been erected. The entrance lobby to the hall, which is laid with a simple pattern of tiles, is 8 feet wide. The vestibule door and door to the hall are hinged with spring hinges, opening both ways. At night the hall will be lighted by six coronas and wall brackets beneath and over the gallery, and at the sides of the platform. The hall is seated to accommodate 550. The buildings have been erected to the designs and under the personal superintendence of Mr. R. A. Wightman, architect, West Regent Street, Glasgow.

**Westminster Training School and Home for Nurses.**—This institution was founded by Lady Augusta Stanley in 1874, and has occupied No. 8 Broad Sanctuary for some years. After the death of the foundress, it was proposed that it would be a fitting memorial to her to erect a new building suitable for the requirements of the school and home, and, after considerable time, a freehold site in Queen Anne's Gate, Westminster, was obtained, and the new building has been erected at a cost of about 7,800*l.*, exclusive of land. The home is replete with every comfort for the nurses, and contains, in the basement, the usual kitchen offices, with ample store-rooms, box-room, and other conveniences; on the ground floor, a handsome hall and staircase, with a stained glass window, with portraits in it of Lady Augusta Stanley and the late Dean of Westminster, and the hall is laid with encaustic tiles. On the left of the doorway is the matron's room, overlooking the street, with telephonic communication with Westminster Hospital; and to the right the nurses' day-room, 24 feet by 16 feet, also overlooking the street. The fireplace has a marble and carved oak mantelpiece, with the badge of the institution carved over it. On the

side of the staircase is a waiting-room, and there is a good lavatory and cloak-room, with every convenience provided at the side of the passage for the nurses. The refectory for the nurses is at the back, and is 30 feet by 16 feet, and adjacent to it is a serving-room, with lift from the kitchen, and also a serving staircase. In the passage also is a lift for coals and luggage, which goes from the basement and delivers at every floor to the top of the building. On the first floor is the matron's bedroom, which has a speaking-tube and bell from the front door for night applications for nurses; there is also a good linen-room, and eight bedrooms for nurses; there is a good bath-room and other accommodation. On the second floor are ten bedrooms for nurses, with bath-room and other accommodation as below; and on the third floor nine bedrooms, housemaid's closet, sinks, and other conveniences. At the back is a small detached building for the reception of nurses who may return from infectious cases, with bath-room and other conveniences; there is also a disinfecting-room and apparatus in the back yard. The rooms are ventilated by Tobin's tubes, and ceiling ventilators. The sanitary arrangements are of the best kind, the drinking water being entirely separated from all other water; the drains are carefully constructed on the most scientific principles, with air inlet, ventilation, and automatic flushing tank. The style adopted is the Queen Anne style, like the houses in the neighbourhood, and the internal finishings are all carried out in the same style. The woodwork is stained and varnished, and an air of old-fashioned comfort pervades the whole building. The builders have been Messrs. Adamson & Sons, and the architect Mr. Stephen Salter, F.R.I.B.A., of 28 Woburn Place, W.

### GENERAL.

**The Liverpool Art Gallery Committee** propose that the Royal Society of Water-Colour Painters, the Institute, which encourages both oil and water-colour work, and some other London and provincial societies, shall each have a room for the exhibition of the work of their members. The selection and hanging is to be done by a committee chosen by each society.

**The Spring Exhibition** of the works of members and associates of the Manchester Academy of Fine Arts, which has been open for about a month, was closed on Saturday evening last.

**A Deputation** from the Manchester Art Gallery Committee has just returned from visiting the chief London studios. Contributions of works are expected from Sir F. Leighton, Messrs. J. E. Millais, F. Holl, J. Pettie, Marks, Yeames, Morris, Gregory, Prinsep, A. W. Hunt, M<sup>rs</sup> Whirter, Shields, Wylie, Whistler, J. D. Linton, Macbeth, G. F. Watts, and other artists.

**The Duke of Northumberland** has subscribed 8,000*l.* towards the Bishop of Newcastle's fund for new churches.

**Mr. J. J. Bradshaw** (Messrs. Bradshaw & Gass, architects, &c., Bolton) has been appointed one of the surveyors to the Board of Trade under the provisions of the Lands Clauses Consolidation Act, 1845, and the Lands Clauses (Umpire) Act, 1883.

**The St. John's Church Site** has been recommended for the proposed Liverpool Cathedral.

**The Promenade Pier** at Ramsgate, which cost 12,000*l.*, has been purchased by Messrs. Head, Wrightson & Co., for 2,000*l.*

**Mr. James Howorth**, of the Victoria Works, Farnworth, near Manchester, has been awarded a gold medal at Calcutta for his ventilating apparatus.

**Messrs. Thomas Lawrence & Son** supplied the facing bricks for the stables at Ashburnham Mews, illustrated in last week's *Architect*.

**The Pennycook Patent Glazing and Engineering Company** have been awarded a first-class certificate and silver medal at the Calcutta Exhibition for their patent system of glazing without putty.

**The Worcester Architectural Society** intend to obtain photographs of all churches in the diocese that require restoration, and also of the churches that have been restored.

**Mrs. Perry-Herrick**, Beaumanor Park, Leicester, has contributed 1,000*l.* towards the fund for the restoration of Peterborough Cathedral.

**Mr. William Russell**, builder, Queensferry, N.B., who has been provost of the burgh since November 1880, died suddenly on Monday morning. Mr. Russell was a native of Queensferry, and his ancestors had resided there for many generations, his grandfather having been for many years provost, while his father held the office of treasurer, and subsequently became one of the magistrates of the burgh.

**A Letter from Mr. Ruskin, Sen.**, will appear in the forthcoming "Life of James Hogg, the Ettrick Shepherd." The writer deprecates that his son, then sixteen years of age, should be writing so much both of prose and verse, and yet should give but scant signs of originality. He says also that he had been trying to make light of his son's abilities, such as these are, as he did not wish the public to think that he "kept a poet."

# SUPPLEMENT

TO THE

# ARCHITECT

LONDON, MARCH 22, 1884.

## THE BUILDING TRADES EXHIBITION AT THE AGRICULTURAL HALL.

ON Monday next the doors of the Agricultural Hall will be open to the Fifth Annual Exhibition of Building Trades' Materials, Architectural Designs, Sanitary Appliances, &c., and it promises to be quite equal in objects of interest to that of last year, which was generally admitted to have been the best held since the inauguration of the display. At the moment we write, when all is confusion in the Hall, owing to the reception of goods, fitting up of stands, &c., it is difficult to conjecture what appearance

the building will assume on the opening day. We, however, notice many changes. Some old *habitués* are absent, though their places are occupied by others, the number of entries being rather in excess of those of last year. With the powerful rivalry of the forthcoming International Health Exhibition, which is to remain open for months, embracing the entire London season, and in its most aristocratic precinct, that welcomes to its galleries every kind of exhibit admissible at the Building Exhibition, and with gold and silver medals spreading their magnetic influence in perspective, it is not to be wondered at if this year many firms prefer the attractions of South Kensington to those of the Agricultural Hall. Mr. SHRAPNEL may fairly be complimented on the success of his endeavours in keeping this annual display up to its usual standard as regards the number of exhibitors. Neither do we consider that a change of exhibitors detracts from the value of an exhibition. In these days of excessive competition and plethora of invention, it is well that opportunities of this character are accorded to every one of making their specialities publicly known; and although in the opinion of many experts the exhibitions succeed each other too rapidly, there is no doubt that they offer opportunities for publicity to large bodies of visitors that are lacking in the ordinary channels of trade.

### Messrs. Robert Boyle & Son.

Prominent amongst those firms who support the Building Exhibition will be Messrs. ROBERT BOYLE & SON, the ventilating engineers, of Holborn Viaduct and Glasgow. Whatever may be the differences of opinion between those who advocate "power" versus "automatic" ventilation, Messrs. BOYLE & SON have shown that their system is effective in every instance in which it has been applied; and beyond a simple gas-burner which they have occasionally used in places where a very sluggish current exists for the admission of fresh air, or to warm that air in cold weather, we believe that no additional aid has ever been called into request by them in any work they have undertaken, while their exhaust or air-pump ventilator always remains the same, viz. purely automatic, and it has this advantage—that it can be adapted to any class of building. Be it a Turkish mosque or a Chinese pagoda, let the architectural design be a "Queen-Anne" mansion or an "Early English" erection, the air pump or exhaust ventilator can be made to add grace to the building and to carry off its vitiated air. To attempt to describe each article on Messrs. BOYLE'S stand would occupy more space than we have at disposal. Nevertheless, there are certain features that call for detailed remarks. In connection with the great interest now being taken in the housing of the poor, the firm exhibit an economical arrangement for ventilating a

workman's cottage of four rooms. We must remember that in most of our manufacturing districts cottages are the "rule" and large houses let out in tenements the "exception" for the working-classes, consequently an inexpensive mode of ventilating cottages is a desideratum. A model of such a cottage as that mentioned is shown, as well as a plan marking the course of the ventilating pipes. The apparatus consists of a 16-inch diameter patent self-acting air-pump ventilator, with 8-inch pipe, 30 feet of  $4\frac{1}{2}$ -inch galvanised iron pipe, 8 feet of  $3\frac{1}{2}$ -inch ditto, one 8-inch double-junction, two  $3\frac{1}{2}$ -inch junctions, two  $4\frac{1}{2}$ -inch bends, ten galvanised iron rests, and four air inlet brackets of galvanised iron, painted with enamel paint. The whole of this is supplied for the small sum of 4*l.* 10*s.*, and the firm add that, as it is intended exclusively for the benefit of the working-classes, they are prepared to supply *bonâ-fide* orders only at the price quoted, which is the actual cost. The same appliances, if ordered for other uses, will be charged at their ordinary rates. The patent air-warmer (illustrated) is a

simple arrangement of tubes, in which a single gas jet is introduced for the purpose of raising the temperature of the fresh-air supply to a building in cold weather and to prevent draughts. It has been found to answer its purpose most successfully, the consumption of gas being very small. The air-inlet tubes are also exhibited in several varieties, some having strainers attached to them for freeing the air from smuts and dust; others, again, being provided with a water-tank for washing and purifying the incoming air. In contradistinction to the air-warming appliance, we are introduced to another for cooling the atmosphere in warm weather. This consists of an air-inlet bracket, of which we give a section on next page. This has a double jacket packed with asbestos, and is fitted with Mr. BOYLE'S improved ice receptacles, which cools and purifies the fresh air introduced from the outer atmosphere. There are, in addition, convective tubes for carrying off the heat and products of combustion from gas, ridge ventilators, and

invisible roof ventilators, and a variety of sewer, drain-pipe and soil-pipe ventilators, and cowls for them. We next illustrate a

double-action soil-pipe ventilator and a single soil-pipe cowl. All of these, with the exception of the last-named, are made on the principle of the firm's exhaust ventilator. Mr. BOYLE has applied his system with equal success to the ventilation of railway carriages, and at the Shipwrights' Exhibition, held

some two years since at the Fishmongers' Hall, the gold medal was unhesitatingly awarded to him by the judges for his novel arrangement in connection with the air-pump ventilator for preventing water, as in the shipping of seas, from entering the saloons. We give a cut of the ship ventilator; but the

other arrangement of which we speak requires a diagram to illustrate it, which we are unable to supply. Many ships have been fitted with these appliances, all of which, we are told, answer their purpose admirably. A working model, showing the *modus operandi*, can be seen on the stand. The rest of the exhibit is mainly composed of an exhaustive collection of the air-pump ventilator in different sizes, styles, &c.; and, taken in its entirety, a more complete set of ventilating appliances suitable for all purposes has been seldom seen at any exhibition.

#### The Sanitary Paint Company.

The handsome and effective stand, with its array of bright colours and examples of wall-decoration, of the Sanitary Paint Company (Messrs. GRIFFITHS, BERDOE & Co.), South John Street, Liverpool, will, as usual, form a prominent feature in the display. The advantages of non-poisonous paints are, fortunately, becoming better understood, and are in more extensive demand every year. GRIFFITHS'S patent white, which takes the place of the ordinary white-lead paint as the basis of all colours emanating from the firm, is now so well known amongst the profession and trade, and has been so often alluded to in the columns of *The Architect*, as to render it unnecessary on the present occasion to enter into the details of its manufacture; but, from an hygienic and a humane point of view, its more extended use should be impressed on all those philanthropists (such as the National Health Society, for instance) who labour in the interests of the community at large. Year by year the deadly effects arising from the manufacture of white lead on the health of the workers—of which a large percentage are females—are brought more prominently before us. The report of Mr. REDGRAVE, C.B., to the Government, and the constant representations of vestries and local boards, show too plainly the danger to life and health that all are exposed to who engage in this occupation, and the pitiable objects that from time to time enter our infirmaries and workhouses call loudly for a reform. Even if we were to admit the argument of those interested in the white-lead trade, that it is superior to sanitary paint, far better that a house should be painted a year before its time than that the health and lives of human beings should be sacrificed to a false economy. But GRIFFITHS'S patent white can offer advantages that white lead lacks. Its inventor contends, and we should not be far wrong, perhaps, if we say that it has been proved in practice, that it is more economical than lead paint, for the same quantity will cover a greater surface, and it works more freely under the brush, while in durability as well as colour it claims superiority. The latter feature may be sometimes seen where it has been used in manufacturing towns, the gases evolved attacking all paints, but from these influences the patent white appears to be exempt. Its properties of withstanding heat, which does not blister it, render it particularly adapted for seaside resorts, or where the powerful rays of the sun exert their powers unchecked. Another advantage of which the Sanitary Paint Company can boast is, that every colour they use, even the emerald greens, are non-poisonous. The most delicate tints can be obtained, all mixing harmoniously with the patent white. Several examples of artistic decoration illustrating these facts will be shown, and amongst them specimens of the Company's silicate distemper will be exhibited. The principal feature of this paint is, that it is mixed with water instead of oil, is also non-poisonous, and as a wall decoration it has advantages over paper, not only from a sanitary point, but on account of its durability and economic features. Another embodiment of the Company's speciality is shown as a silicate paint, possessing extreme hardness, and introduced especially for exposed situations, for which experience has shown it to be admirably adapted. In selecting the term "Sanitary Paint Company" the firm adopted a euphemism well borne out by the character of their productions, and to make these complete in an hygienic sense, we should omit a duty if we failed to mention their non-poisonous petrifying liquid for damp walls, &c., which we recommend every visitor to the Exhibition to see the effect of before he leaves the Hall.

#### Mr. George Jennings.

Mr. GEORGE JENNINGS, of Stangate, Lambeth, appears to view the Building Exhibition in a different light to those firms who are absentees on the present occasion, seeing that he occupies a larger space than on any previous occasion, his exhibit covering a considerable length of two avenues, with double frontage. Here are massed a most extensive assortment of those inventions with which the name of this pioneer in sanitary science has become famous, amounting almost to a replica of the contents of the Stangate show-rooms. A feature that will prove one of the most attractive in the display is a handsome combination bath in French polished mahogany casing, embracing some improvements in the fittings, tending to their simplification in use, and placing effects at the disposal of the bather not hitherto attained. The valves—which

are of the patent anti-percussion order patented by the firm—are all on one side of the upright or shower position, the “hot” being the top ones, and the “cold” at the bottom. Between these are the “douche,” “shower,” and “spray” valves. The novelty consists in the bather being enabled, by turning on the hot or cold valve, to have either one, two, or the whole of the different baths at the same time if he pleases, or even the hot and cold together if he wishes to modify the temperature, securing both a luxury and pastime in bathing. The bath itself is of copper japanned. Mr. JENNINGS is an ardent believer in copper for this purpose, and his belief will bear good justification, for not only does the copper become more quickly heated when a warm bath is required, because there is a less thick body to warm than in iron or other substances, but the metal itself when thoroughly worn out—which, with ordinary care, it will not be for perhaps nearly half a century—is worth nearly half its cost. For office use there are some compact and useful shut-up lavatories in mahogany cases, occupying a space in width and breadth of only 21 inches by 12 inches. The interiors are lined with St. Anne marble, and the basins are of the tip-up kind, hot and cold water being laid on. Then we are introduced to a combination lavatory and urinal, the latter being automatically flushed each time it is used. The lavatory is made of St. Anne marble, the urinal being contained in a cupboard underneath, the opening the door acting upon the water-valve, which continues to discharge itself until again closed. The advantage of allowing water to flow before use must be apparent to all who give a thought to the matter. Another appliance of this character forming a useful appendage to an office, is a concealed urinal. It is of polished mahogany exterior, half-circular in form, intended to be placed against the wall, with a flat top that may be utilised for any suitable purpose, and opening with double doors, this action flushing the urinal as in the others before-mentioned. A point of merit in all these appliances are the superior character of the earthenware utensils. In lavatories the firm as usual appear to great advantage, the many examples shown all exhibiting some point of interest. A commendable improvement in the tip-up basins is the firm’s patented arrangement, that when placed at a certain angle they can be lifted out to enable the under portions to be properly cleansed. A cheap form in which this arrangement is carried out is shown in the accompanying illustration, intended for warehouse or school use. The frame

is of galvanised iron, and although the basin can be lifted out as described, if considered necessary for this to be entirely under the control of an attendant, by a simple arrangement it can be locked, so as to prevent its being tampered with. Another improvement introduced a short time since by Mr.

JENNINGS is in the soap and brush trays for lavatories, which we also illustrate. In place of the sunken receptacles usually

to be found, the marble slabs which often became clogged and emitted unpleasant odours, Mr. JENNINGS introduces a loose tray, such as would be used in the ordinary wash-stand, and dropping by a “sink” into a receptacle formed for it in the marble. Our remarks on lavatories would not be complete did we not mention the patent shower and spray shampooing apparatus, which, as the drawing illustrates, can be attached to any lavatory basin, and by means of a universal joint can be

worked in any direction. In public urinals Mr. JENNINGS has scored many successes, having been called upon to supply those of his manufacture to many Continental and other foreign bodies, besides large numbers that are constantly being

erected in England. An improvement is shown here for the first time in the arrangements for automatic flushing (illustrated), dispensing with the step or treadle action. This consists in fixing a cistern overhead with a syphon and ball-valve, the latter acting in an inverse manner to the usual mode. Instead of the water flowing slower as the ball rises, by an arrangement of valves it opens a second when the cistern is nearly full, giving additional force to the syphon action immediately it is brought into play. This can be regulated to flush at given intervals, and by a branch pipe carried from the urinal it flushes the under portion at the same time, having a pressure of about 15 lbs. behind it. Mr. JENNINGS'S patent ball-traps, which were invented by him long before the Bower trap was introduced here from America, should not be overlooked, and are being extensively adopted for baths and lavatories, and for the overflows to closets. By the sectional drawing appended its action will be readily understood. As the

water flows from above, the route it takes causes the india-rubber ball to rise from its seat, and allows it to pass down the pipe, when the ball falls into its normal position, but should a back pressure occur, the ball is sealed more securely than before, as the pressure is directly upon it. This valve deserves to be universally known. A new wash-out closet of somewhat novel character is exhibited. It is composed of an entire piece of blue-pattern earthenware, complete in itself, oval in shape, flat on the bottom of the pan, with the outlet in the front; but instead of the fan to spread the water a series of holes at the back of pan sends it forward in jets with great force. A simple seat hinged is the only addition required to this closet, and by lifting this it can be used as a urinal, or for emptying slops. As this is intended to be used in the lower part of a household or for public places, where probably stone or brick floors and tile fittings would be in existence, the whole can be readily flushed with a hose-pipe, and kept scrupulously clean. Another closet intended for warehouses or factories, as illustrated, is much to be commended for its automatic

cleanly features. This has a weighted spring seat, always standing upright when the closet is not in use. The action of drawing it down opens the valve and secures a flush, and on

the person rising from it and its assuming its normal position a second flush occurs, thus securing two each time it is used. In addition to these there are specimens of all the other closets made by the firm, some of them having served as models to rival manufacturers on which to base more recent introductions. There is the original "wash-out" first invented by Mr. JENNINGS, the double-seated valve-closet, the patent valve-closet and trap in one piece of earthenware, the patent "trapless" valve-closet—all of which have been fitted up in various parts of the country in large numbers. The Bramah closet is also shown in an improved form, securing an after-flush when the discharge-valve closes. This closet is claimed to be especially adapted for Continental cities, and where the supply of water is limited, and was originally designed for the Rio de Janeiro City Improvements Company, to whom we understand some thousands have been supplied; and its great success, based upon its cleanliness and efficiency, caused the firm to introduce it into the home market, where it is securing equal approbation. Another special feature of the JENNINGS firm are household sinks, and these are exhibited suitable for all parts of the house, kitchens, sculleries, butlers' pantries, and housemaids' closets. A pattern originally made for artisans' dwellings, and of which large numbers have been supplied, would be found equally useful in houses of a better class, and with water laid on it not only offers the advantages of an ordinary sink, but, having a deep trough, may be used for washing up the household crockery, for washing linen, or a bath for children. The collection of plumbers' materials is of an exhaustive character, and there is the usual assortment of sanitary pipes and terra-cotta ware made at the firm's manufactory, Parkstone, Dorsetshire. Another section of the exhibit is devoted to electrical appliances in the form of bells, burglar-alarms, indicators, and the patent automatic electric speaking-tubes, the invention of the firm, of which a detailed account has been given in the columns of *The Architect*. There is yet one other invention of this enterprising firm that deserves mention ere we close our remarks, viz. their patent warming and ventilating apparatus. This, as the illustration depicts, is a most simple appliance, and where steam or a hot-water service is at hand a ready and effective means of heating

buildings of any size. It is formed of an upright cylinder, containing a number of tubes, communicating with the external air by means of a pipe passing through the wall. Around these the hot water or steam circulates, warming the air in its passage through the tubes, and emitting a constant and copious supply throughout the apartment in which it may be fixed, and giving warmth and ventilation at the same time. By the addition of a stop-cock the supply can be regulated to the greatest nicety. Among the notable buildings to which the system has been applied we may mention the Borough Hospital at Brighton and the Metropolitan and City Police Orphanage at Twickenham.

**Messrs. Hodkinson & Clarke.**

We are pleased to find that Messrs. HODKINSON & CLARKE, of Small Heath, Birmingham, are not amongst the absentees, and while they purpose courting the "new love" at South Kensington, they evidently do not intend to cease their attentions to the old one, for they occupy a much larger area than they have done on previous occasions, and introduce us to several of their specialities not hitherto shown here. The pretty little structure of a house in miniature, which may be termed summer arbour, smoking-room, or anything that fancy may indicate, but is here used as a means for exhibiting the various blinds the firm have become such experts in manufacturing, occupies its old position, and will no doubt be welcomed again by old friends, as well as strangers, for it always proves one of the most attractive objects in the Exhibition. Here we have the "Queen Anne" blind adapted for ordinary windows, which we have described in detail on previous occasions, providing a permanent shade for windows, and, if required, a secure shutter; and, while arresting the glare of the sun from entering the apartment, offering efficient means for ventilation. The "Early English" revolving shutter is applicable to any room, though more in keeping, perhaps, to that style of building from which it takes its name. Made to draw down as a blind, it is poised so accurately that it may be controlled by a child, and without disarranging curtains or furniture, while the surface from its shape offers free scope to the talent of the decorator to form an ornament of what is in most instances but an unsightly feature in a well-appointed room. There are several specimens of the metallic Venetian blinds that are coming largely into use, and that the firm have termed "the blind of the future." A choice collection of festoon blinds on spring rollers, are particularly worth notice. The material is Madras muslin, all having a pattern upon them, and being finished and fringed in a very tasteful manner. The Madras muslin, while arresting the rays of the sun effectually, is far more pleasing to the eye than a self-coloured cloth. The remaining objects in this *petit salon* are specimens of painted and stained glass for short blinds and other decorative purposes, for which the Midland metropolis may fairly lay claim to some reputation. Turning to the new portion of Messrs. HODKINSON & CLARKE's exhibit, we find some excellent specimens of revolving shutters—no mere toys or models, but full-size appliances that can be tried and tested, and of superior make and design. Here, too, is a large collection of school furniture and educational appliances of the best and most approved construction. There are several "reversible" seats and desks in the market, but we do not remember having seen one so simple as the "Canadian reversible seat-rail dual desk," which we illustrate. While providing a back to the seat

for the pupil when at work, it can be thrown back against the desk, as shown by the dotted lines, in the event of room being required for readings or other entertainments, a row of seats with backs being thus formed, facing the opposite direction. Another simple but useful appendage is an assistant-master's desk, which is made with either drawers or cupboard at the sides. This is usually mounted upon castors, enabling it to be readily moved to any part as necessities arise. There are several other seats and desks of different design, most of which possess some point of interest. Neither have Kindergarten appliances been lost sight of by the firm, and several pleasing and interesting features adapted to the youthful mind will be

found in the collection. Another recent introduction, which is shown here in section, is a school partition, 10 feet high and of the same width, complete with door, which offers the advantage of dividing a large room into sections entirely independent

of each other. Looking at the educational appliances in their entirety, we should say the aim of the makers appears to have been to provide them of the most suitable kind for modern requirements.

**Messrs. W. H. Lascelles & Co.**

MESSRS. W. H. LASCELLES & CO., 121 Bunhill Row, E.C., exhibit some very excellent specimens of their noted concrete, and a collection of joinery work of their manufacture, all possessing considerable merit, certain individual samples of which will no doubt attract much attention. Messrs. LASCELLES generally manage to introduce us to examples of their work made to special order, and on the present occasion the display is made up largely of such examples. Thus, in their concrete, two windows with mullions and transoms, made for the new wing of Christ's Hospital, City Road, from designs by Mr. JOHN O. ABBOTT, are sent here for inspection previous to delivery. A large portico for the Wesleyan chapel at Lynn, designed by Mr. HATCHAM SMITH, A.R.I.B.A., will have the privilege of being first seen here; and there are three enriched panels, and a piece of large cornice of a light Mansfield colour, a portion of work now in hand for some new mansions in Victoria Street, Westminster. A circular fountain curb, cast in one piece without joints, gives a fair idea of the dimensions to which it is possible to manufacture this artificial stone in a solid body, and there are sundry specimens of the material adapted for walls, pathways, copings, balusters, fender-kerbs, &c. In looking through the joinery work, we notice in particular a green dado, with fortification panels filled in with metal centres, and a pair of handsome teak entrance-doors, heavily moulded and with raised panels, together with a massive wreathed mahogany hand-rail, forming a trio of no mean merit. Three handsome wood chimney-pieces, each of different design, are also exhibited, and some excellent specimens of hard wood panelling help to swell the display. Sundry other specimens, being portions of work actually in hand, though at the moment not available for description, will complete an exhibit that on all previous occasions has collected around it a number of admirers.

**Mr. Henry Bassant.**

The Exhibition is not so "strong" in parqueterie on this occasion as it was last year, but the collection of Mr. HENRY BASSANT, of the West London Parquet-flooring Works, Wells Mews, Wells Street, Oxford Street, is of an attractive character. The designs shown are for flooring and dados, and embrace a number of very tasteful patterns, the blending of colours being remarkably good. There is a handsome design in satinwood, and the admixture of two colours in teak forms a durable and attractive floor-covering. A Grecian "key" in cedar on light oak is very pretty, and pollard oak is introduced in others with good effect. Brown oak and walnut are also used in combination with lighter woods, and a new flooring in pitch pine that can be sold at the low price of 4d. per square foot, is shown here for the first time. Mr. BASSANT's work is well known in the trade as amongst the most reliable made, and we almost regret that owing to a full complement of orders he has not been enabled to make a larger display.

## HUNTER &amp; HYLAND'S SELF-ACTING DOOR ROD,

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, MARCH 22, 1884.

### TENDERS, ETC.

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Supplement to THE ARCHITECT."*

### EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

### COMPETITIONS OPEN.

Policies falling due at Lady-day should be renewed before April 9, 1884, or the same will become void. E. COZENS SMITH, General Manager.

# BELL'S ASBESTOS.

## BELL'S ASBESTOS FLOORING FELT.

This article is manufactured from specially prepared Asbestos fibre, and by its use any building can be rendered comparatively fireproof at a very small cost. This material should be used as a substitute for brown paper under the carpet, and it can be taken up and relaid as often as required; it may be laid between the flooring boards, on the ceiling before plastering, and on the walls. Doors of pine or other wood should be so constructed as to have a sheet of the felt in the centre, so that either side being burned the other remains intact. In houses so protected fires would be localised to the rooms in which they originate. Asbestos felt, being a non-conductor of heat, is superior to any other sheathing, and used under slates has no equal. It yields no dust, lies quite flat, is soft to the tread, and its low cost places it within the reach of everybody. Made in rolls of 36 inches wide.

**BELL'S ASBESTOS BOILER AND PIPE COVERING COMPOSITION** for coating every class of steam pipe and boiler. Non-combustible, and easily applied when steam is up; adheres to metals and preserves them from rust; prevents the unequal expansion and contraction of boilers exposed to weather; covers 50 per cent. more surface than any other coating, and is absolutely indestructible. It can be stripped off after many years' use, mixed up again with 20 per cent. of fresh, and applied again. The composition is supplied dry, and only requires to be mixed with water to the consistency required for use.

A horizontal boiler, 17 ft. 6 in. long, 15 H.P., gave the following results:—

Temperature on Plates .. .. . 186 deg.

„ „ Covering .. .. . 94 „

One ton of coal was saved per week, and, although the fire was raked out every evening 20 lbs. of steam were in the boiler next morning.

The following testimonial refers to this covering:—

Dear Sir,—It may interest you to know that we save exactly 40 per cent. in fuel through using your covering.—Yours truly,  
W. SANTO CRISTO, C.E., F.G.S.,  
Offices of Wimbledon Local Board, Wimbledon, Nov. 28th, 1883.

**BELL'S ASBESTOS PAINT**, for floors, stairs, and all interior woodwork, to prevent the spread of fire. This paint is especially useful in cotton mills, and in fact in all factories and buildings exposed to risk from fire. It is quite free from poisonous ingredients, and is both easily and cheaply applied. Bell's Asbestos Paint has, on several occasions, done great service in preventing the loss of life and property. The great fire in Buchanan Street, Glasgow, in November last, produced the following testimony to the value of this material:—

Offices of the *Glasgow Herald*, the *Weekly Herald*, and the *Evening Times*.

Mr. John Bell. Glasgow, Nov. 14th, 1883.  
Sir,—As one of the means that helped to save our buildings extending from Buchanan Street to Mitchell Street from the recent great fire, I think it fair to say that your Asbestos Paint, which was applied to the outside hoist of the *Evening Times* case-room and other portions, gave valuable proof that it materially aided in resisting the flames from the immediately adjoining tenement while the fire was rapidly destroying it and threatening us in the most serious form. Since the fire, and to assure myself further of the value of the Asbestos Paint as a fire-resister, I placed a piece of wood, with your paint put on more correctly than in our case, into one of our furnaces, with the result that it was brought out without a fibre of the wood being touched, while similar pieces of wood, thrice coated with Irish Lime, at once got into a flame.—Yours truly,  
(Signed) ALEX. SINCLAIR.

**BELL'S ASBESTOS SASH-LINE CORD** is unaffected by heat and damp, and renders unnecessary the use of metallic wire and chains. Ropes made in the same form have great tensile strength, and being indestructible by fire are of incalculable value for fire escapes.

## BELL'S ASBESTOS.

The goods of this house are of the highest quality only, and no attempt is made to compete with other Manufacturers by the supply of inferior materials at low prices. All orders must be sent direct to the undermentioned depots, and not through agents or factors.

**BELL'S ASBESTOS AND INDIA-RUBBER WOVEN TAPE AND SHEETING** for making every class of steam and water joint. It can be bent by hand to the form required, without puckering, and is especially useful in making joints of man-hole and mudhole doors on boilers; also for large "still" joints, where boiling fat and steam have to be resisted. It is kept in stock in rolls of 100 feet, from 1/4 in. to 3 in. wide, and any thickness from 1/8 in. upwards. Manhole covers can be lifted many times before the renewal of the jointing material is necessary. The same material is made up into sheets about 40 in. square, and each sheet bears the trade mark, without which none is genuine. It is very necessary to guard against imitations of this useful material, and to secure themselves against being supplied with these less useful articles at my price, users are recommended to see that every 10-ft. length of the Asbestos Tape purchased by them bears the trade mark.

**BELL'S ASBESTOS CEMENT** for the backing of firebricks and furnaces. The use of this fireproof material saves the expense and annoyance occasioned by the repairs so constantly required in the firebricks and kitchen ranges of private houses. Any labourer accustomed to handle other cements can apply this.

**BELL'S ASBESTOS BOILER PRESERVATIVE.**—This useful mixture, by absorbing the free oxygen that is in the water, entirely checks pitting and corrosion. It also disintegrates incrustation so immediately as to prevent its adhering to the plates. Not only is a great economy of fuel effected by keeping boilers clean, but the risk of having the plates burned is thereby obviated. It has been computed that 1-16th inch thick of incrustation causes a waste of 15 per cent. of coal; 1/4 inch thick, 60 per cent.; and 3/4 inch, 150 per cent. Thus the Preservative avoids the great risks which are inseparable from scaled plates, lengthens the life of a boiler, and covers its own cost a hundredfold by economy of fuel. It is entirely harmless, and has no injurious action on metals. It can be put into the feed tank or boiler, as may be most convenient. Sold in drums and casks bearing the trade mark, without which none is genuine.

**BELL'S PURE ASBESTOS CLOTH**, for protection against the spread of fire. Iron curtains warp, and in the great emergency of fire will often be immovable. Asbestos cloth, being incorruptible, will remain strong and flexible for an indefinite period, and will stay the progress of a fire and the passage of smoke longer than any other known material. This cloth is also extensively used in Maignen's unequalled water filters, for which a gold medal and diploma of honour were awarded by the Special Commission appointed by Her Majesty's Government to receive the reports of the International Juries at the Fisheries Exhibition. By special arrangement with Mr. Maignen, his filters for houses, factories, and towns are supplied by this firm.

**BELL'S ASBESTOS BLOCK GAS FIRES.**—The Asbestos Block Gas Fire is formed by placing inside the ordinary grate a hollow block (burner), composed of Asbestos, and perforated. An iron sole-plate, with a single gas burner, is fixed at the bottom of the block. After being lighted a short time, both the block and asbestos fuel throw out intense heat.

**BELL'S ASBESTOS FUEL** for gas fires. This genuine Asbestos Fuel is composed of the finest hand-picked Asbestos, and its weight is about half that of any other Asbestos fuel.

**BELL'S SPECIAL LONDON-MADE ASBESTOS MILLBOARD**, for dry steam joints, made of the best Asbestos fibre, is well-known for its toughness and purity, and is absolutely free from the injurious ingredients frequently used to obtain an appearance of finish, regardless of the real utility of the material. Made in sheets measuring about 40 in. square, from 1-64th in. to 1 in. and 1/2 millimetre to 25 millimetres thick. Each sheet bears the Trade Mark.

# The Architect.

## ART INACCESSIBLE.

THE "joy for ever" produced by works of fine art may be said to be appreciated by three classes of the community, separately considered. First we have the few—we must speak of them vaguely—who are "cultured." Then we have the many who are capable of becoming cultured. Lastly we have the multitude not capable of becoming cultured. This classification does not correspond with the ordinary division of the population of the country into the upper, the middle, and the lower orders; neither is it identical

with any comparison between the more educated, the less educated, and the uneducated; or even the rich, the well-to-do, and the poor.

Culture, notwithstanding the disputed meaning of the term in itself, seems to be most generally intended to refer to something like an artistic faculty—a literary faculty is the same thing—which has been brought into critical or practical form by a special study of artistic—or literary—productions. A pure mathematician, for instance, or an eminent engineer, or even a distinguished physician or lawyer, we should hesitate to call a man of culture *ex officio*; he is a man of much knowledge, but he may be wholly devoid of those characteristics of what is called an accomplished man which seem to be also looked for in people of culture—most of whom are so ignorant of science, indeed, that it might be almost said the more the culture, as cultured people themselves understand it, the less the science, as scientific people understand that.

The cultured class, then, in this view of the case, is composed of all those who are artists by profession, or amateurs in the widest sense of the term, or people of taste, that is to say, admirers of artistic work—literary work being still the same—with a certain intelligent understanding of its aims and ends which the multitude do not arrive at by instinct or any kind of inner consciousness.

In England up to this time there are many of the better classes who make no pretensions to the possession of taste; and it must be added that there are still more who do make pretensions, but without much reason, beyond the acknowledged fact, for what it is worth, that they are purchasers of "things they like." It is a great gratification, however, to those whose interest in the arts is based on a better foundation, to be able to believe that the numbers of the well-meaning people who are behind the age in these ways are now every day decreasing. It is not to them that art is inaccessible, and they are learning more and more to enjoy it.

Apart from those to whom wealth offers a short cut to the enjoyment of art, the mass of cultured people seem to find their way to it nowadays on the whole pretty readily, and the sum total of refined pleasure which is produced daily throughout the land—and a daily augmenting sum total—is not easily overestimated. Public examples of art of every kind are being multiplied. Artistic exhibitions are becoming, not only more numerous, but of higher quality; and they are being introduced in new quarters everywhere. Private collections, from the most ambitious to the most unpretending, are acquiring a steadily-increasing value. Last not least, the shops, mere tradesmen's shops, for the sale of genuinely artistic objects and ornaments, are perhaps twenty to one compared with what they used to be, and no longer in London only, but in all towns of importance. Art, therefore, is still sufficiently accessible so far. It may be said, in a word, that the cultured classes of English people can at the present moment get a sufficiency of it anywhere for all reasonable wishes; those who can afford it may spend their money as freely as they please and as well as they know how, and those who cannot are not on that account deprived of the opportunity of keeping the artistic faculty pretty fairly busy.

But when we look at the far larger mass of rich and well-to-do English people whose knowledge of the joys of art is so limited as to be scarcely discernible, what we have to consider with regard to them is the question how to open their eyes and

thereby create the desires of taste. The answer to such a question is much more easy than might appear. "Pretty things" are pleasant to all; in fact, "prettiness" of the artificial kind is but the result of "investing with artistic merit" the primary commonplaces of life. The dullest dunderhead in existence recognises what he calls a pretty thing; the very baby loves it. The elevation of the great dead level of humanity to the appreciation of beauty of a higher and still higher order is the advancement of the public taste everywhere. What, then, is the first practical consideration here? Money.

By money we mean, of course, the price of artistic commodities; and here it is that we perceive the cause of art being so often inaccessible—inaccessible, that is, to those whose native desire for it is too sluggish to make them seek it earnestly. Cheap art, in other words, in these days when the activity of intelligence so frequently takes the place of the fire of genius, is the key to the problem how to promote the spread of art, as we are accustomed to say—how to constrain the callous to become sensitive to the divine influences of it, how to create, or at least develop, the generous passion for it.

To take a case, the simplest of all the products of art of the more important kind are the works of the sculptor; a portrait bust, that is to say, is a more unsophisticated portrait in the eyes of most people than a portrait picture, and a piece of statuary a more universally appreciable thing than a corresponding painting. We do not, however, draw this comparison for any other reason than to inquire why our sculptors should demand such high prices for their work. The question is somewhat emphasised, indeed, by certain occurrences of recent notoriety. The professional assistant has come to be a well understood functionary in the sculptor's studio—we do not mean the pointer, but the modeller—and, if tales had been told out of school a little more freely, the vulgar world might have heard of the modelling being even "put out," to be done at a very humble workshop, and nobody made the wiser. Why, then, is it necessary that a small work of the sculptor's art should cost hundreds, and a large one sometimes thousands? It is not always easy to understand why counsel's retainers run up as they do; or why a popular doctor should get such liberal fees as to be able to reject any less expensive honour than a hereditary baronetcy; but when an everyday modeller fails to persuade himself to exercise his art for such prices as people can afford, and prefers, if we may speak plainly, to work for amusement, or even stand absolutely idle, rather than earn two or three guineas a day all the year round—as hundreds might do in England, and hundreds would be only too glad to do in France and Italy, and still keep up to the highest standard of art—surely such etiquette is not only a great blunder on the part of the individuals who practise it, but a much more serious loss to the community at large who lose by it.

This is an illustration, therefore, of art inaccessible; and it is well known that we need not stop at the sculptor if it were desirable to pursue the case further. Our proposition is that the doctrine of cheap art being inferior and unworthy art is an utterly fallacious doctrine, and that, on the contrary, it is artificially dear art that is a commercial blunder—and none the less an artistic mistake. Let art, good art, the best art, be produced cheaply, and the great dead level of the public mind rises to the attraction instantly. To esteem a work of art only by the money paid for it is on the face of the thing to apply the most vulgar of all tests; and now that cotton-spinners are the buyers, not to keep but to sell to other cotton-spinners at a profit when "the market has risen," surely those who have the great traditions of the arts in their keeping must blush rather than smile in their sleeve. It is, however, one of the most remarkable traits of the present day. No matter how much delight a picture is capable of diffusing, the owner regards it with discomfort if he have a misgiving that when judged by an auction-room standard the value of the work is decreasing. Nor is this surprising, when one so often finds that what good folks discuss is, not the beauty of the pictures they see at CHRISTIE'S, but the prices which have been realised.

The case of that remaining class of the people who are not, like the preceding class, directly capable of that culture which the appreciation of the superior orders of artistic effort requires, we need not now enter upon. Suffice it to say that the numerical increase of every high class of intelligence must happily involve the decrease of a lower class; and if cheap art

is at this moment a vital consideration with the great mass of the educated people of England, it is still cheaper art that is necessary for the still greater mass of the uneducated.

## STUDIOS IN ROME: MR. ELIHU VEDDER'S.

[BY A CORRESPONDENT.]

JUST outside of the Porta del Popolo, adjoining the Villa Borghese, is the rising ground which flanks the Flaminian Way, known as Monte Parioli. Its summit is occupied by a semi-cultivated garden and grounds, upon which a group of studios have been recently built. The situation is a beautiful one. It commands fine views of Rome, of the Tiber flowing under the Janiculan Hill and Monte Mario, and on the other side, the Campagna to the ranges of the Tusculan and Sabine Hills. There could be no more suitable spot for an artist to indulge his day dreams, or tranquilly give them a more substantial being on his canvas. One of this group of studios is occupied by Mr. VEDDER, an American painter known on both sides of the Atlantic as an imaginative artist of power and considerable individuality of character. He has been recently employed in illustrating the "Rubáiyát" of OMAR KHÁYYÁM, the astronomer-poet of Persia, whose quatrains are known to English readers in two translations, and appear to have a growing popularity. They are charged with an intense but significant materialism, whether the result of philosophical conclusion, or only worn as a garb to toy with his ignorance and perplexity in regard to the unknown, one can hardly tell. He dwells upon and enforces the pleasure of to-day, disregarding and banishing from his mind the past and the future. The wine-cup is his panacea for every ill, and the oblivion it bestows the satisfaction of every desire, the answer to every perplexity. Unlike SOCRATES, PLATO, MARCUS AURELIUS, and those high lives and noble thinkers who have sought to bestow order, purpose, and moral dignity upon life, OMAR KHÁYYÁM gives up its problems, resigns its struggles, and grasps the present with an eager hand, preferring forgetfulness to pain, the exaltation of a screening excitement to a contest with the difficulties which beset the spiritual life both within and without. With all this, however, there is a profound significance in his utterances. They deal with life and time, infinity and eternity, in a highly suggestive and significant manner. Mr. VEDDER has seized in a very powerful degree the semi-mystic sentiment of the poet, and the illustrations are a very worthy pendant to his verses. His designs are rendered with a firm hand in a frank and manly way, without any mawkishness or false sentimentality. In fact, they are impressed with the seriousness of an intellectual mind and a congenial thinker, who has given himself thoroughly and sincerely to his task.

Mr. VEDDER's series begins with a symbolical representation of the stream of existence arrested by a whirlpool for a moment, then once more flowing into the unknown infinite. An amphora and a spray of vine mark the moment of earthly life ere it is lost in oblivion. The opening of the poem is inaugurated by a drawing in which the Angel of Life withdraws a curtain from a reclining figure just wakening into being, as the personified sun rolls back the clouds of arising day. A shadowy form in the background indicates the still unawakened soul. Amongst the most charming of these designs is the succeeding one, illustrating the lines—

Now the new year reviving old desires,  
The thoughtful soul to solitude retires.

A sage sits reading underneath some trees, through which the morning light struggles: two deer standing beside a jar of water in the foreground. Very impressive, too, is the soul, represented as a female figure, called by premature death to descend the steps of the tomb. Her head is drooping, but her hair floats upwards as the earthly garment falls from her, and even the poppies of oblivion drop from her hand. Palm and wreath of fame or victory are laid aside as the lamp of life flickers, weaving a thin veil of smoke before the entrance to the dark dwelling. The fruitlessness of human study and research is shown by a skull which rests amongst many well-thumbed books upon theology, the upper part of the picture being occupied by the shadowy figures of the dead hopelessly entangled in cobwebs of confusion and perplexity, which even entangle the expired lamp that once enlightened them in their

studies. The poet's comparison of the soul's entrance into being with water flowing, whether it will or no, and its exit to the blowing of the wind, as compelled by a force greater than its own, finds illustration in two serious figures borne upon a visible current, the one floating against the dawn, feeling its first impulses of life; the other gathering up its garments for its passage out of it through a descent of gloom and darkness. The poet's continual appeal to the wine-cup receives many illustrations. The first of these is marked with much seriousness. The poet raises the cup to his lips, his eyes fixed in a deep speculation as he gazes into the mystery of life. Not less beautiful is that in which the minister of wine, a graceful female figure, presents the cup to the poet, as he stoops to kiss her whilst receiving it. Still more impressive is the design in which the angel of death, gloomy and serious, is represented standing by the dark, sedge-grown brink of a stream, offering a cup to the lips of a drooping figure, with closed eyes and relaxed frame, who is fainting over the proffered draught, the sun sullenly setting in the background. With a character quite its own, Mr. VEDDER has here given us a design which in significance, seriousness, and vividness of conception partakes of the quality of the seer. The question of suicide is answered in the drawing by a figure lying on the ground, from beneath which the blood trickles as the dimly-seen soul floats upwards, lost in the gloomy region of the blurred stars, a lamenter going by on crutches looking wistfully at the corpse. Impressive, too, is the procession of the beings of Time under the rule of Death, who plays their march of progress on the pipe, and the sphinx who sits on the fossilised fauna and flora of the past, mixed with the wrecks of human existence. The divorce of Reason and the wedding of the Daughter of the Vine is conceived and expressed with the force and firmness of the antique. In the same manner the poet's draught at the tavern door, the disputes of the "two-and-seventy jarring sects," and his contempt for Science, who stands with a pair of calipers—the measure of within and without—in her hand, as he plays upon a musical instrument with indifference, are treated with remarkable energy and vigour. The latter of these illustrates the verse in which the poet expresses scorn of his own labour in having reduced the calendar to a better reckoning, alleging that it was only striking from it "the unborn-to-morrow and dead yesterday." Very significant is the youth representing the Present listening to the voices of the Past, the shades of the blessed dead appearing like a dawn in the upper part of the picture, whilst others below are dimly seen through pale flames and falling leaves which bestrew the page. The soul's passage through the "Invisible" in search of some indications of the after-life is striking and remarkable. In the upper corner we have the spirit beatified in its own sun-like radiance; in the lower one a face surrounded with billowy flames, "the shadow of the soul on fire." Suggestive also is the design representing the stream of life, emerging from and vanishing into oblivious darkness, the smoke of the wine-cup blurring its most brightly-illuminated point with an obscuring veil. But probably Mr. VEDDER's originality and peculiar power culminate in the design which represents the Fates—spindle, distaff, and shears laid aside at the end of all things, drawing in a streaming net the heavenly spheres, and laying them aside, the expiring embers of effete universes.

But it would be impossible to go all through these remarkable designs with full particularity. It may be enough to mention some of the most noteworthy ones: the Last Man standing on a world of skulls, the serpent of evil at his ear, Love lying dead at his feet; the bowed female figure and a second standing upon a serpent remonstrating with the Supreme Judge; the sage's contemplation in the potter's warehouse; the change from youth to age, in which a blithesome shepherdess spins a thread, which in another compartment Age takes up listlessly in the winter of life, now that her "spinning is all done;" last of all, we have the grave of the poet marked by a slab on which is sculptured the symbol of a broken lute placed upon the emblems of a lifetime, overhung by the branches of a grape-laden vine; and, finally, as a tail piece, a female figure who places on the flowers of his grave, flanked with poppies, a reversed wine-cup in fulfilment of the poet's last request. Other designs enter into the compositions: a bird singing on a skull; the broken rose of pleasure leaving its faded petals on the stream of Time; the Pleiades threading the stars upon a line—all of them highly suggestive.

Whether these drawings be looked upon from the imaginative or constructive point of view they are alike remarkable,

exhibiting wonderful fertility and skill. They embody a largeness of conception and a vigour of treatment characteristic of the most robust schools. Mr. VEDDER has brought to the task of illustrating the work of the philosopher-poet almost as much as he has found there. His illustrations do not follow the text with a slavish literalism; nor are they the result of the factitious disposition of a few studio models; but they are of themselves creative works bearing the stamp of strong individuality of character. It may be predicted of them that they will be received by all thoughtful lovers of earnest art with a warm welcome. We believe that they are to receive their first publication in America, where they will be reproduced in facsimile.

### MEDIÆVAL BUILDING.

AMONG the results of the investigations of the Royal Commission on Historical Manuscripts will be some increase in our knowledge of the conditions under which building was carried out in Mediæval times. A great many documents must exist in the record rooms of cathedrals, in municipal offices, in vestries, and even in private mansions, which would throw a light on the subject. Hitherto they have been neglected, but the systematic course adopted by the officers of the commission will be the means of extracting all information contained in the documents. It is not too much to anticipate that in course of time more will be known with certainty regarding such debated subjects as the relation between the master of the works and the workmen. But to attain this end it would be an advantage if an architect, who had made archæology a study, could be attached in some way to the commission. It is evident from the reports that there are expressions in the documents which puzzle the writers of the abstracts, but which might present no difficulty to an expert.

One of the contract deeds belonging to the Dean and Chapter of St. Paul's dates from July 11, 1348, in the reign of EDWARD III. THOMAS RYKELYNG, a stone-mason, agreed to pull down the walls of the chancel of the Church of Sandon, and to rebuild them on the old foundation to a height of 17 feet at the two sides. There was to be a window in the east wall which was to contain three divisions called "dayes," and each side wall was to have a similar window, but having two instead of three "dayes." At each of the two chief angles there was to be a buttress 5 feet in breadth and  $1\frac{1}{2}$  in thickness, and a buttress of like size in each of the side walls. There was to be a suitable door on the south side. The mason was to be paid twenty marks for his work, and to receive the stone of the chancel.

A deed which is drawn up in French, dated April 7, 1369, is most elaborate, and suggests the skill of CHAUCER'S sergeant, who could "make a thing that coulede no wight pinch at his writing." The parties are the Dean and Chapter of St. Paul's on one side, and ROGER FRAUNKELEYN and JOHN PAGE on the other. The work to be done was at Peterborough. The following is an abstract of the specification:—

Twenty houses are to be built as shops towards the high road, between the first two of which on the east towards the north there shall be a gate with a wicket in it made of old heart of oak. The rest of the work is to be made of new timber of heart of oak. All the windows towards the high road are to have good lintels and to be of one sort, except that at the corner in the east there shall be two fair bay windows. There are to be twenty gables towards the east and west. All the houses are to be of the same width as the existing cellar. In each of them there shall be an entreclos reaching from the ground to the summit, with good steps giving easy access to the different chambers. There are to be "pes des tables" of heart of oak lengthways in every house, and suitable benches in the halls. The carpenters are to provide planks of heart of oak, and to make all the doors and windows of tables of "estland," and the remainder of the tables in solars and in gutters alike of "planches bord" of heart of oak. All the plates in front are to measure 7 inches in thickness and 12 inches in breadth, and all those behind 6 inches in thickness and 12 inches in breadth. The principal studs of the first floor are to be 12 inches in breadth and 9 inches in thickness. The first beam (bressummer) is to be 9 inches in thickness and 13 inches in breadth. The monials in the middle of the windows of the shops are to be 6 inches in thickness and 9 inches in breadth, to fit the thickness of the beam. The joists of the first floor are each to be 10 inches in breadth and 8 inches in thickness. Moreover, the "coiffetre" which shall be between the said "joists" is to be  $5\frac{1}{2}$  inches in thickness and  $7\frac{1}{2}$  inches in breadth, and the studs over it are to be 9 inches in breadth and 7 inches in thickness.

The window studs are to be in proportion. The joists of the cellar are to be 12 inches in breadth and 10 inches in thickness. The principal posts of the building are to be 14 inches in breadth and 12 inches in thickness near the ground, and 12 inches in breadth and 10 inches in thickness at the top. The "entreteys" between the posts are to be 10 inches in breadth and 9 inches in thickness, and the "resnes des resnes" of all the houses 10 inches in breadth and 8 inches in thickness. All the rafters are to be 6 inches in breadth and 5 inches in thickness at the foot, and 5 inches in breadth and 4 inches in thickness at the top. The "lyernes" are to be 6 inches in thickness and 8 inches in breadth. The work is to be completed within two years of the next Michaelmas, and the sum of 303*l.* sterling or in gold is to be paid to the carpenters in instalments.

There is a third contract, which was entered into in 1371. PETER DE WEBBENHAM, a mason, of London (who may have worked under CHAUCER), undertook to carry out the masonry for eighteen new shops, which were to be erected at "Powles-brewerne." The size of each shop was 11 feet by 25 feet. One wall was to be 2 feet thick up to the level of the "gystes" or joists. Foundation-walls were to be carried from one wall to another for the "entercloses," while others were to carry "les principales postes." There were to be ten stone "puttes" for "preves," of which eight shall be double, and each 10 feet in depth. The ten chimneys were to be each  $5\frac{1}{2}$  feet in width between "les jambes," eight were to be double, and made "desus dez mantles de Flandrisch tyle et desouth lez mantles de perez et tylesherd." The Dean and Chapter on their part undertook to provide all the stone, lime, hurdles, &c., except "les Flandrysch tyles et plaster pour lez mantelschides des avaunt ditz chemeneyes" and to pay fifty marks, and "une cote et une chaprone del lever de Evesge del jour dez Innocentz." In those days Norman French was the language of law deeds, but there is not much difficulty in interpreting the conditions. Dutch tiles were apparently as much esteemed in the fourteenth as in the eighteenth century, and the mason was allowed to purchase them, while the Dean and Chapter supplied materials which were obtained from their own lands. In addition to the money there was to be a present of a fur hood. It deserves to be noted that there is no mention of any superintendent in this deed.

Another contract for the erection of shops, this time in Friday Street, is dated August 20, 1410. The contractors were JOHN MORE, a timbermonger, and JOHN GERARD, a carpenter. There is a mixture of English and French words in the deed. The three shops were to have three "stalles" and three "entreclos" on the ground floor, with cellars below. On the first floor each house was to have "une sale, une spence et une cusyne," and in each "sale" were to be "benches et speres." The second floor was to be divided into "une princपाल chambre, une drawingy chamber, et une forein," and was to have "une seyling pece." Each house was to have two "esteires." The height from the ground to the "gistes del primer flore" was to be ten feet and a half, the first floor was to be nine feet high, and the second to be eight feet. In this case there was a plan on parchment, which is referred to in describing the gables towards the street on the east. The doors and windows were to be made of "estricche bord."

Belonging to the same reign is a contract entered into with JOHN DOBSON, a carpenter, for building houses in Bucklersbury. In it mention is made of a "sotel house," an alley, a "garet," two "bay wyndowes," a "parlera," a great cellar, a "warehous," a hall with an "upryght roof," two lintelled windows of two bays, a "tresauce" full of windows in the hall, an "oryell" with a step to give light to the pantry and "botillery" at the east end of the hall, a stable, a "colehous," and a "wodehous." The houses evidently were of a superior class, worthy to exist in a street wherein were "the manor and tenements pertaining to one BUCKLE who there dwelt and kept his courts."

### PARIS NOTES.

DURING the past week the official programme has been issued of the National Triennial Exhibition of the works of living artists to be held at the Palais de l'Industrie in the Champs Elysées from May 1 to June 15, 1886. The works of foreign as well as of French artists will be admitted; but all those that have appeared at the Salon or other annual exhibitions previous to 1878, at universal exhibitions, or at the National Triennial one of last

year, besides all copies or other reproductions—however much the style may differ from the original—will be rigorously excluded. Only 750 works will be admitted in the first section, to comprise 600 oil paintings and 150 water-colours, sketches, &c.; in the section of sculpture the exhibits are limited to 300, in architecture to 40, and in engraving to 100. All works must be sent in and registered between March 5 and 15, from ten to six each day, at the Palais de l'Industrie. There will be absolutely no *hors-concours*, so that every work admitted will have to be passed by the jury, about one-half of which are to be selected by the Académie des Beaux-Arts from among its own members, an equal number being nominated by the Minister of Public Instruction and Fine Arts, while the Minister himself, the Director of the National Museums, the Conservator of the Luxembourg, and the honorary Directors of Fine Arts will be *de officio* members. The jury is to be divided into four sub-committees, one for each section, and each of these will receive various *de officio* members, such as the Conservators of Paintings and Drawings at the Louvre Museum for the painting section, the Conservator of Modern Sculpture at the same museum for the sculpture section, the Director of Public Buildings in architecture, and the Conservator of Stamps at the National Library in engraving. The hanging and disposition of the exhibits will be done by the administration.

The Salon Jury of Painting have elected M. Bouguereau, president; MM. Cabanel, Bonnat, and Busson, vice-presidents; MM. de Vuillefroy, Tony Robert-Fleury, Humbert, and Guillemet, secretaries. Three members of the forty—MM. Baudry, Jules Breton, and de Neuville—having declined to act, their places have been taken by MM. Renouf, Bastien-Lepage, and Van Marck, the first on the list of supplementary jurors. The number of paintings sent in exceeds by 600 those of last year; there are rather fewer drawings and enamels, but the total in the section reaches nearly 6,000. As by the regulations only 2,500 of these can be admitted, and at its first sitting the jury has already passed 562 works from artists exempt as *hors-concours* from examination for admission, less than one-third of the works sent in can be received, and the number of the disappointed must necessarily be greater even than ever. In order to preclude any suspicion of partiality, the examination is being conducted by the jury according to the strict alphabetical order of the artists' names.

Among notable painters who have sent nothing to the Salon this year are M. Meissonnier, who is preparing a private exhibition of his own works; M. Eugène Lavielle, the painter of night scenes of nature; M. Georges Bertrand, who painted *Patrie*; MM. Cazin, Bouvin, and Ferdinand Chaigneau.

MM. Thiebaut, the founders, have completed a splendid reproduction of M. Falguière's statue of *Gambetta*, which is now being exhibited in Paris previous to its inauguration at Cahors next month. The sculptor has been happily inspired. The statesman is represented in his fur-lined overcoat, his right hand resting on a broken piece of cannon, and his feet among broken swords and muskets, the unmistakable signs of national defence, and his whole attitude is one becoming the great leader and orator who never despaired of his country's destinies. The figure stands nearly 11 feet in height, and weighs about 3 tons, being cast in solid bronze.

At its last sitting the Académie des Beaux-Arts elected M. Duphot, of Bordeaux, as corresponding member of the section of Architecture, in place of M. Chenavard, deceased. During the same meeting the committee of the Sculpture section presented to the Academy its list of candidates recommended for the vacant seat in that section. This list is not long, only including two names, those of MM. Mercié and Barrias—certainly the most distinguished of the younger French sculptors. M. Barrias is only forty-three, and M. Mercié barely thirty-nine years of age. The Academy has just received another valuable legacy. A M. Brizard has left an endowment of 3,000 frs. per year to found an annual prize to be awarded to some painter of a land or seascape in oils that has been admitted to the Salon of the year. The conditions of the bequest provide that the recipient must be of French nationality, of not more than twenty-eight years of age on the 1st of January preceding the Salon, and a winner of no prize higher than a 3rd medal.

The decoration of the Victoire de Samothrace Gallery, Daru staircase, at the Louvre, has just been commenced, under the direction of M. Lenepveu. It will consist of four ceiling panels in mosaic-work, illustrating:—(1) Greece, Egypt, and Syria; (2) Holland, Spain, and England; (3) Flanders, Italy, and Belgium; and (4) France—in the sixteenth, seventeenth, eighteenth, and the present century. One of the chief objects of the work, which is expected to take ten years in execution, is to reintroduce and encourage the pursuit of mosaic art in France. In furtherance of this, the Chambers have voted 25,000 frs. a year to the Atelier National de Mosaïque, under the direction of two Italian masters.

The works commenced three years ago at the Louvre, under the direction of M. Guillaume, the architect of the museum, for the strengthening and cleansing of the basements and cellars, have occasioned the discovery of the south-east and south-west towers of the old fortress of Philip-Augustus, the site of which had hitherto been placed on the river-bank, just above the space now occupied by the Jardin de l'Infante. This portion of the old Louvre, as well as a hall with two naves and a central pillar, some ruined walls, brackets with sculptured heads, the remains of the curious drain which crossed the court of Francis I., and emptied into the Seine after passing under what is now Room No. 4 of the Venus de Milo Gallery, a stone sculptured with the knife representing a trumpet of the time of Charles IX. and bearing date 1567, a cistern, and other curiosities have all been carefully preserved, and will be exhibited permanently in the basement, which will shortly be thrown open to the public.

The death is announced, at the age of sixty-two, of Adolphe Aze, a painter who during the Empire attained considerable celebrity. He was a pupil of Robert-Fleury, and, while still under thirty, achieved sudden fame with his remarkable work *Diana surprised by Endymion*. This obtained him a second-class medal in 1851, and in 1863 he was placed amongst the *hors-concours*. For upwards of ten years he had been totally incapacitated from work by paralysis.

The friends of M. Ribot, the painter, whose reputation among his professional brethren and connoisseurs, is perhaps even greater than with the general public, gave a dinner at the Continental Hotel on Saturday last to celebrate his recovery from a protracted illness. M. Eugene Boudin, the marine painter, presided, and the guests numbered 150, among them being MM. Bardoux, Under-Secretary of State; M. Kaempfen, Director of Fine Arts; Antonin Proust, ex-Minister; and many other celebrities in the art world.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

ON Saturday afternoon a party of about seventy members of the Edinburgh Architectural Association visited Prestonfield House, Craigmillar Castle, and Peffermill, the permission to inspect which had been kindly granted them beforehand. Conducted by Mr. Thomas Ross, one of the members of council of the Association, the party first visited Prestonfield House, where they were much interested in the "heather room," and the old drawing-room, which has a quaintly grotesque ceiling, and contains a recess behind the wainscoting in which Prince Charles is said to have concealed himself. It was also explained that the Marquis of Lorne was born in this apartment. Several letters of a private nature were read by permission, and from these an interesting record was obtained of the details and construction of the present building.—its predecessor having been maliciously destroyed by fire on January 11, 1681, when its then owner (Sir James Dick) was from home.

Having, on the motion of Mr. Russell, returned their thanks to the proprietor and tenant of Prestonfield, the members subsequently made an inspection of Peffermill House, which is three storeys in height, with attics, and is on the L plan, with a circular staircase at the re-entering angle. The building is long, high, and narrow, each room extending the full width of the house, and all entering through each other. The kitchen is on the ground-floor, and, along with the room adjoining, is arched. A door alongside the fireplace admits to a small chamber behind it in the thickness of the wall. Possibly this is an alteration, and the whole space may have formed the original fireplace. The house was built by one Edgar—probably Edward Edgar—in 1636, as the date on one of the dormers indicates; and at that time, and for about a century before, the lands of Peffermyle, in the barony of Craigmillar, belonged to the Edgars, an offshoot of the Edgars of

Wedderlie, in Berwickshire. Accordingly the arms of that family are carved over the beautiful entrance doorway.

The party afterwards proceeded to Craigmillar Castle, of which the following particulars were read to the company:—The castle consists of an old Scottish keep of a style to be found all through the country, and to which extensive additions have been made at later times, until the whole has grown to be one of the large-sized castles of Scotland. The keep stands on the edge of a cliff about twenty feet high, and is so near the edge that there is scanty room left for access to the door, while at some parts a foothold on the top of the rock is all that can be obtained. Immediately in front of the door a cutting made in the rock almost severs the path, and before the additions to the castle changed the aspect of affairs at this point, this cutting must have made the castle almost impregnable. The doorway, which looks to the west, is round-headed, and surmounted by the Preston arms. It gives access to a small entrance hall from which two doors diverge—that on the left leading to the ground floor, and the one in front to the staircase. By the former you enter a small chamber in the thickness of the wall, from which you pass into the large chamber on the ground floor. This is vaulted, 17 feet 6 inches high, with an intermediate floor of wood. The under floor was divided by a partition wall into two apartments. The staircase leading to the great hall is on the corkscrew plan, and after going up for a couple of revolutions, or about 10 feet, it comes to a stop, and one is shunted to the right, on to another staircase, on which the ascent is continued. At the shunting point a door overlooks the entrance hall, and the shifting of the staircase to the side may have been done to give more room to men defending the castle in the event of the outer door being forced. The great hall is a noble apartment, 35 feet long by 20 feet 9 inches wide, and 24 feet 6 inches high to the apex of its pointed roof. The walls, which are of an average thickness of 9 feet, are pierced by windows on the north, south, and east, all provided with stone seats. The fireplace is a fine specimen of its kind, and is quite entire. The hall has been divided into two storeys, and the stone corbels for supporting the beams are painted. There is a small arched room off the hall known as Queen Mary's room. As usual, the stair leading to the top is not in continuation of the lower one, but is on the opposite side of the door and passage leading into the great hall. Ascending this stair, a door leads off to the floor over the hall, and another to an entresol room over Queen Mary's room. This is a very beautiful apartment, and adjoining it is a most complete garderobe. The main roof, almost entire, is very flat, and covered with overlapping stones, the under stone being wrought with a groove along the sides of its upper surface. Two rows thus wrought were laid in their sloping position, with a space between for the overlapping stones, which extended over the grooves, the object being that rain blown in beneath the edges of the overlapping row would be caught in the groove, and thus run down to the carefully-formed gutter. The roof was doubtless constructed flat for the convenience of working military engines. The total height of the keep from the top of the rock is about 70 feet. The additions made at various times consisted first of a great curtain wall, of which the keep itself forms a part on the south, having angle towers, and enclosing a courtyard averaging 122 feet by 80 feet. Later, and at various times, within this courtyard buildings have been added against the curtain walls of the east, west, and south sides, having the entrance through the north curtain. Beyond this, on the east, west, and north, are other walls, strong and high, enclosing a space of about  $1\frac{1}{4}$  acre within the castle bounds; and within this space, again, various offices were built at different times. The curtain walls are about 28 feet high to the top of the parapet, and 5 feet thick. Inside the entrance doorway on either hand is an arched recess about 9 feet above the ground, each having a spy-window and stone seat for a sentinel. The east range of buildings is three storeys high, with a gloomy sunk floor at the south end, all vaulted except the upper floor. The beautiful entrance doorway in connection with this range superseded the old doorway to the keep, and in connection with it a wide turnpike led up to the great hall and the upper floors of the new wing. At the side of the new door, and in the thickness of the wall, a separate stair leads up to the kitchen, which has a large arched fireplace, stone sink with drain, and service window into the corridor leading to the great hall. From the floor above the kitchen, through the south-east tower, the east and north battlements are reached. These are supported on bold corbels with intervals between, through which stones could be thrown on an enemy approaching the base of the walls. In the centre of the south-east tower is a raised platform, reached by steps, from which shooters could send arrows over the heads of those defending the battlements. When the west wing came to be added, the west curtain was nearly all taken down and rebuilt, as it is seen now, with windows and chimneys, and without the machicolations. This was the latest addition made to the castle. It is two storeys high, with vaults at the south end. The rooms are large and handsome, entering through each other, as was the style of the seventeenth century. This was evidently the family side, with its separate entrance from the courtyard, now kitchen, dining-room, and private bedrooms. The dining-room has a beautiful fireplace, once lined with Dutch tiles, and a window with mullion and transom. From the bowling-

green, immediately outside this range of buildings, a flight of steps led down to the gardens at the lower level, where the bed of the fish-pond can still be seen. Between the east curtain and the outside wall is a small roofless chapel, measuring within the walls 30 feet by 14 feet 9 inches. Except that the gables have crow-steps, the chapel is very much in the style of the late Perpendicular work of England. The large ivy-covered building at the west end was a Protestant Presbyterian meeting-house, erected upon the indulgence granted by James VI. It was probably one of the barns or offices of the castle, and turned to this purpose. All writers on Craigmillar refer to the arms of the Cockburns, Congaltons, Mowbrays, and Otterburns, as adorning the walls of the castle. None of these are there now; nor any other arms except the royal arms, which surmount the Preston arms over the entrance, and again over a door leading out to the south battlements, and the Preston arms, which occur four times. Craigmillar came into the possession of the Prestons in 1374, and remained their property for almost three hundred years. As is evident from its style, the keep was built about the early part of the fifteenth century, and the curtain walls shortly after. In 1543 it was taken by Hertford and much demolished; and probably the buildings inside the east curtain wall were built shortly after that time, and perhaps part of the west wing also, although it was undoubtedly altered and enlarged in the seventeenth century by the Gilmours, who became possessed of the castle about that time. The chapel is of fifteenth-century work, and the outer walls were probably built after the English invasion.

Previous to taking their departure, the members, on the motion of Professor Baldwin Brown, awarded a vote of thanks to Mr. Little Gilmour, the proprietor of Craigmillar.

### THE LATE MR. WILLIAM HUGGINS.

THE death has been announced in many quarters of Mr. Wm. Huggins, animal and historical painter, remarkable for his versatility and fidelity to nature. There is a branch of art in which he also excelled which peculiarly entitles him to attention from an architectural journal—we mean his truthful rendering of ancient architecture, a class of subject most difficult in itself, and requiring in almost every respect a completely opposite mode of treatment, to which he was probably led by the influence of his brother, Mr. Samuel Huggins. Be this as it may, no man perhaps ever had a more profound feeling for the picturesque in architecture, or saw further into the world of beauty enshrined in old buildings by time, wind, rain, moss, lichen, and minute vegetation. What he saw and felt keenly he translated truthfully and vividly into art, and produced from time to time pathetic and elevating pictures, more especially during his residence in Chester, to which his strong love of the picturesque and beautiful of other days warmly attached him. Charmed with the venerable beauty and quaintness of the cathedral, he devoted much of his time to committing it to canvas in a very powerful and original manner, and executed *Chester Cathedral from the City Walls*. He also painted *The Ruins of St. John's, Chester*; *View from St. John's Churchyard*; and *A General View of Chester from the Far Side of the River*. All these and many other architectural subjects throughout Cheshire and Lancashire, among the former being *Bebington Church*, and on the banks of the Thames and elsewhere, were almost perfectly rendered by him. The "Huggins Gallery," which is to be formed at the forthcoming Art Loan Exhibition at Chester, will probably contain some specimens of this class of his productions.

### SIMPLICITY IN GREEK ART.

A LECTURE was lately delivered by Professor Waldstein, of Cambridge, to the members of the Literary and Philosophical Society of Leicester, on "Simplicity the chief characteristic of Greek Art." The lecturer remarked that he had set himself the aim, and it might be an ambitious one, of attempting to convey to them, in a comparatively short address, the chief characteristic features of an art which had been admired by all appreciators of the beautiful in all historical ages, and which had since formed the groundwork for the canons of modern taste. For the purpose of a succinct title he had chosen one attribute, which seemed to him the most salient and most distinctive belonging to the art of the Greeks. He might have done better if he had chosen the epigrammatic summing-up of the chief characteristics of the works of Greek art by the founder of the study, but it was its simplicity rather than its grandeur which he wished to show was inherent in the art of the Greeks. In speaking of simplicity as applied to people and things he meant that there was a right balance between all the parts—between the expression and the thing expressed. Aristotle, in attempting to define virtue and good, did it by means of the two opposing extremes, and in the middle, between the extremes, he found the good, the perfect, and the beautiful. Half-way between the opposite extremes of foolhardiness and cowardice lay courage, and between the extremes of niggardliness and

recklessness lay the best economy. So with people and the taste displayed in their surroundings. They would call a room or a house perfect in taste if, in the first instance, they were impressed with its thorough homelike feeling; and again it would be found if, in decorating their rooms, they always considered the means at disposal, the aim and object of the structure, the thing to be expressed, and the means they had of thus expressing it. In the same way in the expression of thought by means of words, they called that the most simple and natural form in which there was thorough harmony between the thing expressed and the means of expression. Perfection in all the manifestations of human thought and feelings, in all the creations of the human hand through the intellect and the heart, could only be found when there was that simplicity, that absolute harmony between the thing expressed and the means of expression. Then how was the artist, whose work was to take a definite form, and had to appeal to definite thoughts and emotions in the spectator, to find around which subject and problem that harmony was to group itself? In the first place he must turn to the study of the material he used—the language at his disposal for conveying those thoughts and suggesting those feelings. All arts were means of expressing human thoughts and feelings, and with a certain manipulative skill or verbal fluency they could convey by means of those agents almost any thought in a more or less perfect manner. But very often when, in the period of degraded taste, the skill and dexterity with which the technical craftsman had pinched and distorted the language at his disposal into a meaning not at all suited to his language, that skill was often admired by people as being one of the chief artistic merits of the work. But it was a total aberration of taste. An artist must study not only what he could possibly express by means of the material at disposal, but he must study those subjects best suited to be put into that material or language, and then there was the greatest chance of there being that complete harmony between the thing expressed and the expression, which was essential. Sculpture was the art in which the Greeks had more distinctly brought out the spirit of their national genius, and the remains of that art which had come down to us were numerous. But a sculptor had first to study the material language by means of which he was to express certain conceptions of the mind and certain feelings of the human heart, and he must never ignore the essential nature of that material, for if he did there would be discord between the language he used and the thing he expressed—there would be a want of simplicity, and the spectator would not be affected in that harmonious manner in which art ought always to impress them. The form the sculptor placed in his material should naturally suggest the chief characteristics of life and of the organic world. The chief characteristics of stone and metal were, first, that they were lasting and unalterable. Therefore the artist should produce, by means of his technical manipulation of the material, that illusion of form, that composition of the parts of the figure, which naturally and necessarily suggested the essential characteristics of the organic world, and of a living human figure, and see that there was no discord between the life that was placed in the statue and the material used. In Greek art they had what was called the archaic, or childhood period, and they had the period of decline, which began with the end of the fourth century and reached down to the Roman times. In the work belonging to both those periods they would notice, as the characteristic feature which marked it as being imperfect, the obtrusion of the material upon the senses of the spectators, counteracting the harmony between the thing expressed and the means of expression, and devoid of that supreme simplicity which marked their highest productions. In order to illustrate this the lecturer drew attention to specimens of sculpture of the early and later periods. In the first they were chiefly impressed with the difficulty which the artist had in producing what he required. In a later example of the period of transition to greater perfection, they had just a reminiscence of that constraint; whilst in the later specimens, of the period which marked the decline of Greek art, they had the characteristic of the most accurate study of the anatomy of the human figure. That presented itself so much that it was called the anatomical school. But anatomy was not the first study of art. The obtrusion of that skill in modelling, however perfect it might be in itself, was again to the detriment of that complete harmony which the artist ought to express. The spectator was carried away by the manipulative skill of the sculptor. The artist chose the most dramatic scenes from life, which were transient, and therefore absurd when set in bronze or marble. The attitude was momentary, whilst the material in which it was set was durable, and therefore the lack of harmony still prevailed. Between the two extreme schools that he had mentioned came the perfection of Greek art, and that was inseparably associated with the name of Phidias, born at the beginning of the fifth century B.C. Unfortunately not one of his great works had come down to them. But they had full accounts of all descriptions of his work by many authors, and from those they could form an idea of what his work was. The remains which had been preserved were from his designs, and mainly executed by his assistants, so that they had only a faint reflex of the greatness of his own art. But still there was hardly an artist, however eccentric, who would not say that never since that time to the present day had the same perfection

been attained. Professor Waldstein then described the sculpture and the mouldings of the eastern and western pediments of the Parthenon at Athens, the work of Phidias, of which he had sketches, going into details to show the breadth and perfectness of the conception and the harmony of feeling and mode of expression which was throughout it apparent. In this they had the characteristics belonging to the best of Greek art. However grand and noble the subjects were that Phidias chose for expression in the most lasting and monumental material, there was always that simplicity in the work which appealed to the meanest and most childlike understanding of the Greek mind. That was carried out in the whole composition, and not simply by one figure. The artist by every means at his disposal suggested, in the figures themselves and the lines of the composition, the great thought which he wished to convey to the simplest spectator. And not only in the composition, but in the subject, that complete harmony obtained between the means at his disposal and the thought he wished to convey, whilst in each separate figure they had the perfect power of model. In Phidias they had that simplicity which was required. In all his figures they felt that he had the power of representing just what he wished to represent, and that varied simplicity, that naïveté, and noble grandeur which characterised the works of the Greek.

### PRICES IN THE IRON TRADE.

THE return of Mr. Waterhouse, accountant to the Board of Arbitration for the Manufactured Iron Trade of the North of England was issued on Saturday. It gives the net selling prices of the leading classes of manufactured iron—viz., rails, plates, bars, and angles—for the first two months of the year. This return confirms the statement of the iron manufacturers, made at the late Arbitration Board meeting at Darlington, that prices of iron had seriously fallen this year. It also goes to show in a very marked manner the decline of trade, production being lessened. In the two months ending February 29 the production of all classes of manufactured iron amounted to only 90,616 tons, as against 109,220 tons in the two months ending December, and 117,365 tons in the previous two months ending October 31. A comparison of the returns shows that the falling-off of 27,000 tons in the output, as compared with the October return, is due altogether to the lessened demand for shipbuilding iron. Bars and rails have maintained their tonnage, but plates and angles are very much reduced. In the October return plates were 77,628 tons, in the December return 74,393, and in that just issued 60,874 tons. Angles have declined still more in proportion, for in the October statement they stood at 24,159 tons, in December 20,079 tons, and in February 14,050 tons. Bars stood for 15,215 tons in October, 14,227 tons in December, and 15,178 tons in February. In the matter of prices the trade wears an equally unsatisfactory aspect. In the October return plates were 6*l.* 3*s.* 2*d.* per ton, in December 5*l.* 19*s.* 11*d.*, and in February 5*l.* 14*s.* 7*d.* Bars in October stood at 6*l.* 3*s.* 11*d.*, in December at 6*l.* 0*s.* 5*d.*, and in February at 5*l.* 18*s.* 10*d.* per ton. Angles were 5*l.* 10*s.* at the first period, 5*l.* 9*s.* 1*d.* at the second, and are 5*l.* 3*s.* 8*d.* in the present return. Rails present only a few hundred tons production in each return, and the price does not vary so much as the other descriptions. The decline of 4*s.* 4*d.* in the last two months comes upon a previous reduction, taking the whole of last year of 10*s.* 7*d.* per ton, and gives for the fourteen months 14*s.* 11*d.* This return, showing so much depression in trade, and such a reduction in price since the present year commenced, cannot fail to have an important bearing upon the forthcoming arbitration, to be undertaken by Dr. R. S. Watson, upon the claim of the iron manufacturers for a reduction of 10 per cent. in wages.

### EDINBURGH CASTLE.

THE Cockburn Association have forwarded a memorial to the Marquis of Hartington, Secretary of State for War, on the restoration of Edinburgh Castle, in the course of which they say:—"The matter which your memorialists now respectfully desire to submit for your Lordship's consideration affects the amenity of the ancient Castle of Edinburgh. It is the restoration of the great Hall, in which the Scottish Parliament sat for a very long period prior to the erection of the present Parliament House in 1634. It is now used as a hospital, to provide the necessary space for which the original building has been subdivided by partitions, and by the insertion of two storeys between the floor and roof, with a staircase to give access thereto. The restoration of this ancient and beautiful Hall is a matter not merely of local but of national interest, and your memorialists are satisfied that its importance will be recognised by your Lordship. They understand that the work of restoration would be attended with little or no difficulty, and would meet with general approval if undertaken under the direction of the Government officers. The hospital accommodation which the

building now affords is of the poorest and most unsatisfactory nature, and your memorialists believe that better is urgently demanded, and might be otherwise supplied without any serious difficulty or expense. Were the hospital provided for elsewhere, the old *'Aula Castri'* of Scottish history, restored to its pristine beauty, and used for purposes of State festivity or recreation, might become once more a pride and honour, not merely to Edinburgh but to Scotland."

In some "Notes" on "The Parliament House of Edinburgh Castle," the Association say:—"This ancient hall is far more identified with Scottish historical events than the building now forming the vestibule of the Courts of Law, which dates only from the reign of Charles I. It was in the former edifice that, when they met in Edinburgh, the Estates were convened during most of the fifteenth and sixteenth centuries, and till the Tolbooth superseded the hall as the place of assemblage of Parliament. It was here that the hasty trial and condemnation of the sixth Earl of Douglas and his brother took place in 1440. It was here 'where Knox conferred with Grange and Lethington, where Charles I. held his coronation banquets, where Argyll feasted Cromwell.' . . . In the process of sub-dividing the hall certain struts have been removed; but the direction of the vacant mortises seems to afford a satisfactory clue to their position and a guide to the restoration of what is wanting. The roof-timbers are in good preservation, and are from their size and appearance presumably of foreign growth. Were an opportunity afforded for more careful examination by the erection of scaffolding, and were the partitions and floors cleared out and the walls stripped of the plaster, there can be no doubt that the original features of the building would be still more clearly discernible, and ample materials afforded for a faithful restoration."

### MR. W. E. LOCKHART'S DRAWINGS.

ON Saturday last, Mr. Dowell sold by auction, in Edinburgh, a collection of water-colour pictures by Mr. W. E. Lockhart, R.S.A., who is about to leave for London. The following were the principal prices:—

"The Town Hall, Crail," 15*l.* 15*s.*; "Church Interior, Majorca," 21*l.*; "The Last of the Old Pier, St. Monance," 32*l.* 11*s.*; "Moonlight on the Clyde," 15*l.* 15*s.*; "Cambuskenneth," 18*l.* 18*s.*; "A Harvest Field in Fife," 38*l.* 17*s.*; "The Last Haul of the Season," 18*l.* 18*s.*; "A Spanish Venta—Muleteers Departing," 52*l.* 10*s.*; "The Towers of St. Machar's, Aberdeen," 23*l.* 2*s.*; "A Clover Field in Fife," 17*l.* 6*s.* 6*d.*; "Harvest Time, Crail," 43*l.* 1*s.*; "Palace of the Duke of Montpensier, Seville," 21*l.*; "In the Highlands," 17*l.* 17*s.*; "St. Andrews," 23*l.* 2*s.*; "On the Forth, near Stirling," 36*l.* 15*s.*; "House in Granada where the Empress Eugenie was born," 25*l.* 4*s.*; "A Palace in Palma," 52*l.* 10*s.*; "A Farm in Fife," 25*l.* 14*s.* 6*d.*; "The Beacons of Crail," 27*l.* 6*s.*; "A Summer Day," 34*l.* 13*s.*; "Snow Scene from my Drawing-room Window," 28*l.* 7*s.*; "West Wemyss," 18*l.* 18*s.*; "Ford's Hospital, Coventry," 17*l.* 17*s.*; "Glengarry," 35*l.* 14*s.*; "Cowie, near Stonehaven," 42*l.*; "Cottages near the Borestone, Bannockburn," 33*l.* 17*s.*; "Street in Siena," 31*l.* 10*s.*; "Morning in St. Andrews Bay," 27*l.* 6*s.*; "A Rocky Shore," 15*l.* 15*s.*; "Stirling, from the Forth," 17*l.* 17*s.*; "Dunnottar Castle," 17*l.* 17*s.*; "In St. Andrews Harbour," 31*l.* 10*s.*; "Carting Seaweed," 18*l.* 18*s.*; "Alcala de los Panaderos, Spain," 21*l.*; "The Cottar's Hairst," 21*l.*; "Moorish Mills, Cordova, Spain," 21*l.*; "A Fishing Village," 52*l.* 10*s.*; "On the Seashore, St. Andrews Bay," 16*l.* 5*s.* 6*d.*; "Queensferry—Sunset," 15*l.* 15*s.*; "Glen Errochie—Sunset," 15*l.* 15*s.*; "A Fife Village," 15*l.* 15*s.*; "A Wet Day," 27*l.* 6*s.*; "The Funeral of Robert Burns," engraved, 73*l.* 10*s.*; "Dunblane—A Rainy Day," 37*l.* 16*s.*; "Dunstanborough Castle," 15*l.* 15*s.*; "Norham," 18*l.* 18*s.*; "The Gleaners," 16*l.* 16*s.*; "The Village of St. Ninians, Stirling Castle in the distance," 26*l.* 5*s.*; "An Old Scottish Harbour," 57*l.* 15*s.*; "Moorish Mills, Cordova, Spain," 29*l.* 8*s.*; "Breaking up the Wreck, Dunbar," 15*l.* 15*s.*; "The Poet's Rest, Stratford-on-Avon," 29*l.* 8*s.*; "The Towers of the Alhambra," 21*l.*; "A Calm Day off Corrie, Arran," 16*l.* 5*s.* 6*d.*; "Evening," 21*l.*; "Don Quixote at the Puppet Show," 126*l.*; "Stonehaven—Early Morning, the boats coming in," 26*l.* 15*s.* 6*d.*; "At the Window, Andalusia," 16*l.* 16*s.*; "Warkworth," 32*l.* 11*s.*; "A Baptism in San Giovanni, Siena," 89*l.* 5*s.*; "Kenilworth," 25*l.* 4*s.*; "The Duke of Wellington's Trees, Alhambra," 15*l.* 15*s.*; "Berwick-on-Tweed," 33*l.* 12*s.*; "The High Street, Crail," 31*l.* 10*s.*; "The Piazza del Annunziata, Florence," 48*l.* 17*s.*; "Warkworth, looking up the River," 29*l.* 8*s.*; "A Turnip Field, Crail," 22*l.* 1*s.*; "Spanish Beggars," 21*l.*; "Staircase in Lord Provost Ure's House," 27*l.* 6*s.*; "A Quiet Fisher Village," 17*l.* 17*s.*; "An Orange Grove, Majorca," 27*l.* 6*s.*; "The Salmon Nets, Crail," 21*l.*; "Holy Island Church," 17*l.* 17*s.*; "The Alhambra, Granada," 44*l.* 2*s.*; "San Telmo, Seville," 15*l.* 15*s.*; "Dunblane Cathedral," 26*l.* 5*s.*; "Sunny Hours," 23*l.* 2*s.*; "In an old Moorish Patio, Granada," 35*l.* 4*s.*; "His Eminence" (painting in oil), 75*l.* 12*s.*; "Itálica (Spain), the Birthplace of the Emperor Trajan," 21*l.*; "A Spate on the Garry" (painting in oil), 23*l.* 12*s.* Paintings by other artists (the property of Mr. Lockhart):—"Aberdour Castle," by Sam Bough, R.S.A., 18*l.* 18*s.*; "The Cattle Shed," by David

Cox, R.A., 42*l.*; "The Iron Spire—Rouen Cathedral," by Jules Lessore, 15*l.* 15*s.*; and "Dutch Canal Scene," by James Maris, 31*l.* 10*s.*

### BIRMINGHAM ARCHITECTURAL ASSOCIATION.

A MEETING of the Birmingham Architectural Association was held on Tuesday, Mr. W. H. Kendrick in the chair, when a paper was read by Mr. Franklin Cross (hon. sec.), upon "John Henry Chamberlain and Architecture." The author of the paper discussed generally the principles and spirit of the work of the late Mr. J. H. Chamberlain as an architect and as an artist, and while highly praising the beauty of detail which it displayed, urged that it was wanting in rhythm and coherency between the parts. In fact, it was too much in the nature of architectural patchwork. It was more as a decorator than as an architect that they must admire Mr. Chamberlain. In his buildings might be seen peeping out here and there bits of the loveliest detail, often equalling in beauty the best in ancient examples; but those they only regarded as costly buttons on the garment. They required the good figure first, and then the gilded garnishing of the garment. Probably to this intense desire of decoration, instead of form for its own sake, might be attributed the general monotony of his buildings and the similarity between all classes of his buildings. In Mr. Chamberlain's work there was a great deal to love for its prettiness, but little to admire for its nobleness. He always composed love-songs such as to attract their eye, but their imaginations were never captivated and conducted to regions afar off. He was one whom it would take a man of no mean power to emulate, much more to surpass. He rode well towards the crest of the great art-wave of naturalism now tossing over the continent of Europe. He was artistic, but he did not go meandering into mediævalism and reproduce in his architecture relics of an exploded feudalism. A modern utilitarian architect in every sense, he seized the materials of modern introduction, such as iron and terra-cotta, and made them bend to his will as his judgment and taste dictated. The "little garden" had blossomed under Mr. Chamberlain's tender care, and the result might be that our homes would be better, our streets more beautiful, our churches and chapels fit for the worship of a sublime Creator. Art might, then, be as cheap as the cheapest commodity, and it would grow in our highways and byways of modern life, and our cities and towns would become the Athens and Venice of modern times.

A discussion followed, in which Messrs. Doubleday, V. Scruton, J. Cotton, and others took part. All the speakers referred in terms of admiration to Mr. Chamberlain's work, although some of them criticised particular features of it. All of them also confessed to a debt of gratitude to him for having lifted architecture in Birmingham from the dull level into which it had fallen, and expressed the conviction that his example would be attended with most beneficial results in the time to come. A vote of thanks was unanimously passed to Mr. Cross, and the proceedings terminated.

### HOUSE SANITATION.

A PAPER was read by Dr. Robert Bell at the meeting on the 19th inst. of the Glasgow Philosophical Society, upon house sanitation. The author said that dishonest plumbers and builders were frequently as guilty of manslaughter as were the wretches who from time to time were convicted of that crime at the bar of justice. He referred to two cases of bad drainage met with in his own experience. In one of the cases four children had been attacked with typhoid fever, while in the other case a number of children had been attacked with diphtheria, as a consequence of defective drainage. It was appalling to contemplate how many valuable lives might have been sacrificed to the avarice of tradesmen in the construction of defective drains. As a protection against bad drains he suggested that the work should not be covered in until it had been inspected by a surveyor, and certified to be in perfect order. The pipes should also be examined periodically. He recommended that the surveyor should be appointed by Government, and that he should be independent of plumber or proprietor.

Dr. Ebenezer Duncan said that if sewage gas propagated fever at all, it did so in a very small degree. In his own practice he found that where there were defects in the sewage pipes of a house the inhabitants suffered from headaches and sore throats, but he had no reason to believe that epidemics were propagated by sewer gases. It was too frequently the case with medical men when they were called in to a case, and found there was a defect in the drainage of the house, they considered the defect sufficient to account for the disease. That, he thought, was a false position for any man to take up. He agreed with Dr. Bell that Government inspectors should be appointed, and he thought that the smoke test should be applied to all pipes in order to ascertain whether they were in proper working condition.

Mr. Thomson, architect, said the present state of the drainage in Glasgow was a disgrace to civilisation.

A vote of thanks was accorded to Dr. Bell for his paper.

## NOTES AND COMMENTS.

WE have to announce with great regret the death of Mr. JAMES THOMAS KNOWLES, the well-known architect, which took place at his house in Russell Square on Sunday last. Mr. KNOWLES had attained the ripe age of seventy-six, and for some years past had retired from practice. He was a Fellow of the Institute of old standing, and died a member of the Council and Chairman of the Board of Examiners for District Surveyors under the Buildings Act. His professional work was of a miscellaneous private character, the Grosvenor Hotel at Victoria Station and the Thatched House Clubhouse in St. James's Street being perhaps his best-known buildings. He was to be congratulated upon having made a considerable fortune by his practice. Of his character and disposition we cannot speak too highly; he was signally a man of broad views and large experience, upright and honourable, courteous and considerate, a sound adviser, and a staunch friend. One principle of his is worth quoting for the benefit of the younger men of his profession:—"Don't merely make your work strong," he used to say, "make it stronger than strong." His son is Mr. JAMES KNOWLES, the distinguished editor of the *Nineteenth Century*, an architect also by profession, and a member of the Institute.

AN association of manufacturers and exporters has been founded in Stuttgart which might be imitated elsewhere with advantage. The agency does no business on its own account, but leaves the execution of all orders to the respective manufacturers, its only aim being the furtherance of the export trade by bringing buyer and seller into contact. With this object it publishes an annual catalogue in four different languages, containing the names and addresses of the various firms belonging to the society, and undertakes to transmit to the different manufacturers any orders received from abroad. Sample orders may be addressed to the agency whenever a personal selection is impracticable, and assistance and advice are readily granted in all transactions. The society guarantees the reliability of the firms composing its members, and undertakes to transmit goods ordered, packed and complete, within a specified time. Should a manufacturer, from any cause whatever, be prevented from executing an order, the agency undertakes to transmit it to another equally good house.

THE forthcoming Health Exhibition will be remarkable for the number of exhibitors; that is, if a conclusion may be drawn from the complaints of exhibitors who have been allotted no more than a fraction of the space they solicited. It would seem as if the programme had been based on too large a scale, or too many foreigners had been invited. If the visitors are in proportion, the committee will have no reason to be dissatisfied. It deserves to be noted that, although the work is apparently carried out in an inexpensive style, these exhibitions are costly. At the Fisheries Exhibition there was a daily average of over 18,000 visitors, the total number being 2,703,051, yet the balance remaining, after paying expenses, did not reach 9,000*l*. In other words, the profit on every visitor was only about  $\frac{1}{4}$ *d*. By taking credit for the rent due on the Health Exhibition, the furniture, &c., the balance has been brought up to 16,753*l*. The expenditure amounted to 131,392*l*.

A BUSINESS meeting of the Royal Institute of British Architects was held on Monday, the 24th, the President, Mr. H. JONES, in the chair. Upon a resolution proposed by the Council that two old members of that body should go out of office every year, an amendment was moved by Mr. RIDGE, and seconded by Professor KERR, to the effect that this was not a satisfactory response to the wish of the general meeting expressed on a former occasion. The amendment was carried by a small majority, all the members of Council present voting against it, although Mr. WATERHOUSE explained that he and some of his colleagues within the Council had opposed the conclusion arrived at. Notice of two motions was given by Professor KERR for a meeting which is to be held on April 21st, to the effect that the distinction made on the face of the voting papers between the old members of Council and the new nominees is undesirable, and that the honorary secretaryship ought to be restored to its old form of one secretary for home business, and another for foreign. A new arrangement was agreed to respecting the examination for the admission of

Associates, whereby to extend its application to the colonies, it being already extended to all parts of the United Kingdom. A further proposal that after 1887 the principle of examination should be applied to candidates for admission as Fellows, was postponed for consideration at another meeting. The business, we are pleased to hear, was conducted without asperity; and we are fain to hope that a good deal more of the spirit of concession (to adopt a phrase employed by the Honorary Secretary with less tact than we had given him credit for) may now be exhibited on the part of the members of Council generally, as the only means of avoiding further complications. It is quite clear that such a body as a Royal Institute of Architects in England cannot possibly for any length of time be made the subject of autocratic experiments by casual office-bearers; the very instinct of the national character is against it.

BUYERS of Eastern rugs like those which flood the market are disappointed when they find that the beautiful colours are fleeting. The Persian Government have issued a decree prohibiting the importation of aniline dyes, which were found to exercise an injurious effect upon the textile industries of the country. If this prohibition is strictly enforced, there is reason to expect that Persian carpets will resume their former reputation for durability of colour, and thus improve the demand for them in Europe.

THE annual Spring Exhibition of the Manchester Academy of Fine Arts, which was held last month, has been fairly successful. The sales of pictures amounted to 802*l*, as against 760*l* last year, the number of works sold being about the same; 233 season tickets were purchased, and 2,275 persons paid for admission at the turnstiles, being an increase of 72 season tickets and 783 admissions on payment over last year. At a meeting of the Academy, which was held on Tuesday evening, the following architects were elected associates—viz., Messrs. WILLIAM A. ROYLE, ROBERT J. BENNETT, W. K. BOOTH, and HAROLD G. GRIMSHAW.

THE abolition of the duty on silver plate is now demanded with increased vigour, and it would seem as if the duty was an impediment to the production of artistic work. It has been said that English pottery must have been in a different position to what it now holds if an institution analogous to Goldsmiths' Hall exercised sway over the pottery. The duty has, however, the advantage of keeping the English trade in the hands of English goldsmiths. Some of the German Chambers of Commerce have been complaining of the duties upon silver plate and table accessories in England, which amount to a complete exclusion of German wares from the English market, and an abatement of the import duty by at least 5 per cent. on the value is demanded. The trade with England, it is believed, would, under conditions more favourable, be no inconsiderable one.

THE Edinburgh Architectural Association have published a lecture which was delivered in the last session by Mr. MARSHALL, M.A., the rector of the High School. The subject is "Amateur House Decoration." One extract will show that the author has embodied "an experience in picturesque treatment of interior which was very suggestive and valuable at the present time." "The separation of so-called high art from the art of the decorator has a ruinous effect on both. Our pictures are poor in style, mean in design, pale and ineffective in colour; our furniture and our draperies are ugly and unmeaning. No painter can be a fine painter, in the sense in which Titian, or Veronese, or Reynolds was a fine painter, who is not essentially a decorator, painting with a view to the walls of noble rooms and galleries. No decorator can be a fine decorator who is not essentially an artist, that is, an exponent through skilful handiwork, of an ideal—of something too great and too deep for words, which unites our souls and bodies with the songs of birds, and the bloom of flowers, and all the large magnificence of visible nature. An architect's aim, it seems to me, should be exactly the same in kind with that of a sculptor—to fix noble emotions in noble form; a decorator's should be that of the painter—to express in line and colour, in a given space, the passion of mankind, its love and its joy. I do not see where the line is to be drawn between them. If there is any sacredness in noble flow of line or splendour of colour in statue or in painting, there is just the same sacredness in noble design of frieze or column; in splendid harmony of curtains, and carpets, and wall paper."

THE HEN AND CHICKENS HOTEL AND ARCADE, BIRMINGHAM.

A COMPANY has recently been formed for restoring the well-known Hen and Chickens to its former uses as an hotel, and for forming an arcade of shops from the portico and vestibule of the hotel, connecting New Street with Worcester Street, emerging into the open space near the front of the Market Hall, and thus enabling foot passengers to avoid the acute angle formed by the junction of these streets.

The arcade will be divided into twelve bays on each side, each comprising a shop 12 feet wide, with a room over it; the depth of the shops will vary from 17 to 23 feet, and any number of shops on the same side may be connected if desired.

The avenue is about 14 feet wide, covered by a semi-circular arched roof, formed of cast-iron main ribs, with wooden sub-divisions glazed with ornamental glass. The floor, which will have a slight incline, will be of Val de Travers asphalte. Each shop will have a room over it of the same size, reached by a staircase at the back of the shop. On the eastern side there will be a row of bedrooms on the second floor, to be used in connection with the hotel.

Underneath the whole area of the ground floor will be a large vaulted apartment, well suited to the purposes of a restaurant, as ample accommodation for kitchen and other offices may be provided; and beneath a part of the lower level of the site will be a sub-basement for cellars, &c.

The style of the architecture will be Renaissance with somewhat of a French character, of rather an ornate description. The architect is Mr. JETHRO A. COSSINS, of Warwick Chambers, Corporation Street, Birmingham.

MUNICIPAL BUILDINGS, LERWICK.

WE publish a view of the town-hall in Lerwick, the chief town of Shetland, which was opened in July 1883. The site is on the most elevated part of the ridge on which the town of Lerwick is built, and adjoins the county buildings, with which it groups. The materials are local free-stone, with Isle Edday stone dressings, the former being of a grey, the latter of a cream colour. On the ground floor are burgh court-hall, measuring 24 feet by 30 feet, magistrates' rooms, safes, and police-cells. On the opposite side of the main corridor are Custom House offices and Inland Revenue offices, with various departmental offices and stores attached, and with entrance from the north elevation. On the first floor, which is reached by a wide stone stair, is placed the town-hall, measuring 60 feet by 30 feet, and 25 feet high, with timber ceiling running up to the roof. On the left side of the main stair are placed refreshment and retiring rooms, and on the right side a reading and news room, 22 feet wide by 23 feet long. Over this portion of the building are two smaller halls, respectively measuring 22 feet by 23 feet, with smaller side-rooms and a staircase opening into the tower. The building was designed by Mr. ALEXANDER ROSS, architect, Inverness, the contractor for the works being Mr. JOHN M. AITKEN, Lerwick. The cost of the building, exclusive of gifts, was about 4,500*l*.

REREDOS, ST. JOHN'S, WEYMOUTH.

OUR illustration of St. John's Church, Weymouth, shows a new reredos, organ-case, and mural decoration recently completed. The central subject of the reredos is the *Good Shepherd* in white alabaster. The reredos was carried out by Mr. EARP, of Kennington Road, and the colouring by Messrs. RUBARDT, from the designs and under the personal direction of Mr. E. FRANCIS CLARKE, architect, of 7 Westminster Chambers, S.W.

ST. PHILIP'S CHURCH, SOUTHPORT.

THIS design, by Messrs. CLARK & MOSCROP, of Darlington, was submitted in the competition recently decided. The committee's report concerning it states that they "unanimously regret that they could not adopt it for want of funds." Accommodation is provided for 800 persons, with transept extension of 100. All the seats are arranged so that the congregation have uninterrupted view of the pulpit. The external walls are proposed to be faced in parpoint Yorkshire stone,

with internal brick lining. Wagon-shaped roof, divided into panels with moulded ribs, stopped upon elaborately carved and moulded cornice. Hammer-beam principal rafters, with traceried spandrels. Roofs to be covered with Welsh grey slating. All internal exposed woodwork to be of pitch pine. The exits are specially attended to, and the plan is well adapted to carrying out the ritual of the Church as required by a large congregation.

ST. OUEN, ROUEN.

THE view shown in the illustration is taken from the east perambulatory looking into the choir. The original drawing is by Mr. HUON MATEAR, of Liverpool. It suggests the beauty of an interior which has always charmed English visitors. Long before Mr. RUSKIN discoursed upon St. Ouen, Dr. DIBDIN, the bibliographer, gave the following account of his impression upon entering the building:—

You gaze, and are first struck with its matchless window: call it rose or marigold as you please. I think for delicacy and richness of ornament this window is perfectly unrivalled. There is a play of line in the mullions which, considering their size and strength, may be pronounced quite a masterpiece of art. It was towards sunset when we made our first entrance. The evening was beautiful, and the variegated tints of sunbeam admitted through the stained glass of the window just noticed were perfectly enchanting. The window itself as you look upwards, or rather as you fix your eye upon the centre of it from the remote end of the Abbey, or the Lady's Chapel, was a perfect blaze of dazzling light, and nave, choir, and side aisles seemed magically illumined. We declared instinctively that the Abbey of St. Ouen could hardly have a rival, certainly no superior.

The grand western entrance presents you with the most perfect view of the choir. Nothing more airy and more captivating of the kind can be imagined. The finish and delicacy of the pillars are quite surprising. Above, below, around, everything is in the purest style of the fourteenth and fifteenth centuries. On the whole, it is the absence of all obtrusive and inappropriate ornament which gives to the interior of the building that light, unencumbered, and fairy-like effect which so peculiarly belongs to it, and which creates a sensation that I never remember to have felt within any other similar edifice.

The Abbey of St. Ouen was founded in A.D. 533, and it is therefore the most ancient of the abbeys of Normandy. It was destroyed by the Normans when they landed at Rouen in the ninth century; but when the leader, ROLLO, became a Christian a new building was erected. After undergoing many vicissitudes, the monastery was again destroyed by a fire in A.D. 1248. In the beginning of the fourteenth century JEAN ROUSSEL MARC D'ARGENT was elected abbot, and in 1319 he was enabled, by the aid of CHARLES DE VALOIS, the brother of PHILIP LE BEL, to lay the foundation-stone of the new buildings. The works continued until the abbot's death in 1339, when they were interrupted; but it has been estimated that the cost up to that time was 2,600,000 frs. Although much remained to be executed, there was a long period of inaction, until the abbacy of D'ANTOINE BOHIER, who was called "Le Grand Bâisseur"—that is, about 1510.

The architect of St. Ouen was ALEXANDRE DE BERNEVAL, who was called "Maître des Œuvres de Machonnerie du Roy," and he was a sculptor as well as an architect. He died in 1440, and was buried in the Chapel of St. Cecile, which is one of those around the choir. There is a legend that, in a fit of jealousy, he killed his pupil for introducing the pentapla, which was made the basis of the rose window in the northern transept. But the story is now supposed to have no more foundation in fact than many other legends. That DE BERNEVAL was skilled in the arrangement of windows is plain from the southern rose window.

The quality of the style of St. Ouen has been truly described by the late AMBROSE PYNTER, when he wrote:—"The Normandy Gothic touched its highest point about the middle of the fourteenth century, and the church of St. Ouen at Rouen may be considered as the most perfect type of the most perfect style of Gothic the world has seen. It needs no description; and no description, no pencil, could do justice to its elegance, its magnificence, and its purity. It is in the eastern portion of the edifice that the character of the Gothique Rayonnant is the most perfect; but though long in progress, the original design was always respected, and none of its progressive details have been suffered to injure the general effect."

## THE AMSTERDAM EXHIBITION.

THE following is the official report by Consul Robinson on the International and Colonial Exhibition at Amsterdam :—

The history of this very interesting exhibition includes experiences which may be of value in similar cases in future. The projector and subsequent manager of the exhibition, M. Ed. Agostini, of Paris, commenced his operations about three years ago, having formed a well-grounded opinion that the city of Amsterdam presented many favourable features for such an enterprise. His original idea was the creation of an exhibition under the direct patronage and management of the Netherlands Government and the city of Amsterdam, by means of a guarantee fund to be subscribed among the citizens of the latter. This proved, however, to be impracticable, in consequence of their want of confidence in the success of the undertaking; and eventually an arrangement was concluded with a private firm in Brussels, who accepted the entire financial responsibility of the exhibition for themselves and their sub-contractors, on condition of being permitted to make their own bargain with the exhibitors and the public. The Government consented to give its direct patronage and a considerable subsidy, and the city authorities placed an ample space of ground, in an excellent situation on the western border of the city and adjoining the fine buildings of the National Museum, gratuitously at the disposal of the executive committee. The organisation of the exhibition was embodied in a set of regulations, and the executive committee undertook the general management, the administration being placed in the hands of M. Ed. Agostini, with the title of Commissary-General of the Exhibition.

Negotiations were entered into with all foreign Governments, and some of them granted subsidies. The absolute amount appropriated cannot at present be exactly determined in all cases.

It will be seen that, in consequence of the arrangement by which the exhibition became practically entirely a private speculation, though advertised as being under Government patronage, many difficulties and disappointments were experienced by exhibitors. The contractors were naturally anxious to make the best bargains in their power, and to secure themselves as far as possible against the chance of loss. Under these circumstances, it was natural that conflicts should occur; and at the very outset a difficulty arose which jeopardised for a short time the whole enterprise. It was found that the contractors had granted to one firm of forwarding agents the monopoly of the local transport of exhibits into and out of the exhibition buildings, on a tariff which, though perhaps not exorbitant for single packages, was decidedly so for larger lots of goods. The firm in question had, of course, on the basis of their contract, made the necessary arrangements in the way of lighters, bridges, rails, &c., for bringing in the goods; and when these arrived exhibitors found themselves before an accomplished fact, and pledged without their consent to the payment of what they considered very exorbitant transport charges. Much indignation was felt and expressed, and many exhibitors threatening to withdraw altogether, the Executive Committee found it necessary to allow exhibitors to make their own arrangements—a decision which, however, by no means put an end to the difficulty, as no other means of bringing the goods into the buildings existed than those constructed by, and the property of, the firm to whom the monopoly had been given. Hurried measures were adopted to supply the want, but the result was an unavoidable amount of confusion and expense. The dual character of the exhibition reacted upon its success in many ways. Exhibitors were deterred from taking part in it from a want of certainty as to the parties with whom they were really dealing; and Colonial Commissioners found on their arrival here that, though accredited to the Netherlands Government, they had practically to deal with persons over whom the Government neither had nor professed to exercise any real control.

In spite, however, of all these drawbacks, the exhibition itself was undoubtedly a great success, and offered many novel and interesting features. This object of the promoters was to combine with an ordinary exhibition of international manufactures, products, and fine arts, a colonial exhibition on a scale hitherto unattempted; and in this latter enterprise they were eminently successful, owing to the patronage extended to the exhibition by the greater Colonial Powers and their Colonies. It is not necessary to go into any great detail as to the International European part of the show. Though many countries were creditably and extensively represented, it cannot be said that the total impression could be compared with that of its predecessors at London, Paris, and Vienna, nor was this to be expected.

France decidedly bore away the palm in the number and quality of its exhibits, followed very closely by Holland and Belgium. Germany, though fairly well represented by numerous exhibits, did not compare favourably with the three first-named countries. The other European nations offered little worthy of special remark; and the show of British goods, with few exceptions, was of the very poorest character, so much so as to make every British visitor regret that his country was represented at all. The number of British visitors was comparatively small, no doubt in consequence of the exhibition being practically almost ignored

by the British press—a matter the more to be regretted, as in its other features it should have been especially interesting to the British nation. In the Fine Arts Galleries the exhibits of France and Holland were of exceptional excellence, but those from other countries were neither numerous nor of any great interest. England was entirely unrepresented.

There was an excellent show of machinery, principally from France, Belgium, and Holland, the colonial sugar industry being especially well exhibited by several complete installations for cane-crushing and boiling. The paper-making of Belgium and the shipbuilding industry of Holland also figured prominently and well. England, with one or two exceptions, was again very indifferently represented. Part of the new National Museum was occupied by a loan exhibition of retrospective art of quite unusual excellence, attached to which were the loan exhibits from South Kensington, part of the collection of H.R.H. the Prince of Wales and of Lord Lytton, with other private collections from British India, which were much admired.

But the chief feature of the Amsterdam Exhibition, and that which gave it its distinct and characteristic interest, was the colonial section, together with the sections of China and Japan. In these the elaborate art productions of the ancient civilisation of the Chinese and Japanese Empires, of British India, and of the Dutch East Indies, were shown on a scale hitherto unapproached as a whole; the manner of living, dwellings, utensils, and home industries of the great peoples of the East as well as of the West Indies, were spread out in almost endless detail. The peoples themselves were numerous represented, and Chinese, Japanese, Hindoos, Javanese, Malays, the native and negro races of Surinam, Arabs, Turks, Tunisians, could be studied at their work and in their homes. Even a Javanese concert and ballet could be enjoyed, and proved a great attraction.

The Dutch East and West India Governments had erected a spacious separate building on the grounds of the exhibition, containing certainly the most complete collection of the products, arts, and industries of these countries, and of models of every possible description of dwelling, household utensils, modes of transport, roads, bridges, and plantations, which has ever been brought together. It will be a great pity if such a splendid collection should ever be dispersed again; and I understand that steps are being taken to give it a permanent character. The Surinam native, negro, and mulatto races were housed in another large separate building, and were a source of endless curiosity and interest—the people themselves, their houses, dresses, rude arts and industries, and mode of life forming a lively picture. This was a private speculation, about thirty of the natives having been brought to Amsterdam for this purpose, and lodged in a large and lofty circular building, with ample room to display themselves and their belongings.

The exceedingly tasteful and interesting British Indian court did very much to counterbalance the painful impression made by the English exhibits. The raw produce of British India, its ancient arts and industries, were well and compactly set forth. The novel experiment of a tea-room, in which at certain hours the Calcutta Tea Syndicate provided an excellent cup of tea gratuitously, was a great success as far as the constant crowd of visitors was concerned; and it may be hoped that the object of the syndicate, the introduction here of Indian tea for consumption, has been thereby advanced. The textile fabrics exhibited were of special interest, and altogether the arrangement and appearance of the court was very satisfactory.

Siam was represented by a small but interesting exhibition of products and models. The Chinese exhibits, which were attended to entirely by natives of that empire, occupied a very large space, and were of almost endless variety. With the exception, however, of some very beautiful examples of cabinet work and of porcelain, &c., they compared rather to their disadvantage with their Japanese neighbours, who had brought together an immense collection of objects of art, of considerably greater intrinsic richness and excellence. So large and beautiful a collection of the best products of Japanese art has probably never been seen.

The French colonies were represented by Tunis, Algeria, Senegal, New Caledonia, French Guiana, Réunion, Cochin China, Pondicherry, and Tahiti, the Tunisian exhibition occupying a large building specially erected for the purpose, and containing a fine collection of industrial and artistic productions, together with the raw produce of the country, such as the splendid iron ores of Mokta and Benisaf, and the North African marbles.

The Australian Colonies of New South Wales and Victoria were especially prominent, with a magnificent show of their raw produce—wools, gold and other metals and ores, coal and shale, wheat, woods, &c., together with their native wines, tinned and preserved meats, and other industries. Their ethnological, botanical, mineral, and natural historical collections were deservedly admired for their completeness and excellence. Altogether, these two Colonies made an excellent figure, and their exhibits have certainly left an abiding impression on the trading world here.

Of other British Colonies, the Cape of Good Hope, Trinidad, Singapore, Natal, Mauritius, Demerara, and Queensland, were more or less adequately represented by exhibits. Brazil and Uruguay showed very fine collections of raw produce, coffees,

sugars, wools, &c. The Transvaal had a small but well-selected show of wools, wines, ostrich feathers, wheat, and other raw produce and minerals. The Republic of Haiti was also represented by a small but carefully selected collection of its products.

It will be seen from the above short summary that the object of the promoters of the exhibition, as far as they aimed at a comparative show of the colonial products of the whole world, was very fairly attained. In many instances the collections were of unique excellence and interest.

As to the results of the exhibition, as far as the pecuniary speculation of the promoters is concerned, it is difficult to say whether the final winding up has been a profitable one for them, but there seems much reason to doubt it, as they have involved themselves in endless responsibilities, disputes, and lawsuits. The great lottery, which formed part of the programme, has certainly contributed its share of discredit to exhibition lotteries in general, by the apparent disproportion between the nominal and the intrinsic value of the prizes.

It does not seem at all likely that it would be possible to get up another International exhibition on the same basis as that on which this one was founded: nor that it is advisable for Governments to join, or to give their patronage to international exhibitions in which private speculation plays the foremost part. That private enterprise in connection with exhibitions is becoming very general, and in many cases indispensable is clear, but it seems desirable that it should be confined to the construction and management, and that the Government or some public body should accept the final responsibility if the exhibition is to be of a truly international character.

As far as the city of Amsterdam itself is concerned, it must be confessed that the balance of results appears to be a very beneficial one. No doubt many expectations have been disappointed, and many speculations have proved failures. But, on the whole, the city and its inhabitants have greatly profited by the Exhibition. The improvements which it called forth are permanent, as is the information and experience acquired: new blood has been poured into the veins of the old city, and new ideas have made themselves felt.

## THE INTERNATIONAL FORESTRY EXHIBITION.

AT the last weekly meeting on of the executive committee of the International Forestry Exhibition in Edinburgh, the tenders for erecting the exhibition buildings were under consideration. The plans for these buildings, which will be of wood, with incombustible felt roofing, have now been prepared by Mr. Robert Morham, City Superintendent, and will suit the site—Donaldson's Hospital grounds—on which they are to be erected. Access will be obtained by the western gateway of the hospital, the eastern being reserved for the ordinary traffic to and from the institution. The principal entrance to the exhibition will be situated on the gravel walk, about twenty yards within the grounds. Entering by a vestibule, in which will be six turnstiles, visitors will proceed along a covered roadway for a short distance, and then, turning to the right, will pass between a jurors' and a left-baggage room into the exhibition building at its western end. The plan of the building is a parallelogram, about 500 feet in length by 60 feet in breadth, with three transepts about 80 feet in depth. At the southern end of each transept a doorway and flight of steps communicate with the outside grounds. A handsome dome will surmount the building at the intersection of the centre transept, and the symmetry will be maintained by cupolas of somewhat similar construction, where the other transepts intersect the main building. Light will be obtained from these, as well as from a zone of glass along each side of the roof-ridge. The walls are to be constructed of upright six-inch flooring, grooved and dressed, except the gable walls of the transepts, the woodwork of which will be arranged diagonally, giving a more ornate aspect to the exterior of the structure. In the interior a series of over forty arches, with the open woodwork of the roof and copious decorations, will enliven the scene. In rear of the main structure, in the space between the transepts, refreshment-rooms, kitchen, lavatories, &c., will be situated. It is proposed to erect several minor buildings of an ornamental nature in the grounds, and the plan of one of these, in the form of a Swiss chalet, has been sent to Her Majesty the Queen for her approval. The railings enclosing the hospital grounds will be boarded up to secure the privacy of the exhibition, and with the same object wooden fencing, 8 feet high, will enclose the exhibition ground upon the remaining three sides. Buildings of a commodious nature, for the accommodation of the executive committee, are to be situated in a field to the west of the hospital grounds, altogether outside the exhibition.

A printed list has been forwarded to the committee by order of the Government of India, showing the publications and maps relating to forest administration in that country which have been sent to the Edinburgh exhibition. A further communication has been received, applying for space for wood, bamboos, &c., which are also in course of transmission. The Maharajah of Johore is an exhibitor in almost every class, while the Governments of Chili and Denmark have applied for 630 and 600 feet respectively. The

Scottish Papermakers' Association have obtained a space of 400 feet in the exhibition, and the number of contributions promised by our foresters, as well as the models and carvings of private individuals, point to a most exhaustive and interesting display of the arboricultural resources of the country. In the New Brunswick Legislature a speech was made by the Hon. Duncan Wilmot, the Lieutenant-Governor, in which he said that the attention of his Government had been called to the proposed International Forestry Exhibition to be held in Edinburgh during the present year, and intended to be illustrative of the forest produce of the world. He had deemed the occasion a fitting one in which to make more widely known the variety and extent of the forest resources of that province, and by which public attention was thus being attracted to New Brunswick through the medium of a display of its forest wealth. He had thought it expedient to seize the opportunity to disseminate information as to their splendid agricultural capabilities. Mr. Peter White, M.P., was also moving in the direction of having Canada properly represented at the Forestry Exhibition.

## THE ECCLESIASTICAL COMMISSIONERS' SOUTHWARK ESTATE.

THE Select Committee of the Ecclesiastical Commissioners, appointed on December 13, "to consider and report upon the subject of certain house property in Southwark of an inferior and dilapidated character," have issued their report. The committee, having inquired into all the circumstances of the property, many of their number having visited it personally, state that it is a part only of the Southwark Estate, formerly known as Winchester Park, and consists of a number of small and narrow courts abutting on Redcross Street, and is adjacent to, but not a part of, the district known as the Mint, the boundary of the Commissioners' property being that of the ancient "Liberty of the Clink." The occupiers of the houses—about 1,056 in number—"are labouring people, almost entirely 'unskilled' workers, employed in the water-side warehouses, in hat-making, &c. Some obtain their living by 'rabbit-pulling,' an employment peculiar, apparently, to this district, and said to be very detrimental to the health of those engaged in it, and to the comfort of their immediate neighbours." The report states that the weekly-rented property which had come into the possession of the Board in this district is of "a very poor character"; much of it is in a wretched condition, and such as "could not, by any process short of rebuilding, be brought up to the standard of modern sanitary requirements." The committee had had no difficulty in coming to the conclusion that the right course to pursue was to let the greater part of the area, if possible, for the erection of labourers' dwellings. A builder of good repute had taken a lease for a long term of years of a large part of the Redcross Street site, to build dwellings of the character required, and they will be erected under the supervision of the agents of the Commissioners. The committee add:—"They will accommodate a much greater number of persons than that now occupying the same ground, and they will be so planned as to include a large number of rooms which may be let either singly or in sets of two or more." In arranging this letting the Estates Committee had taken special care that any removal of the present tenants "shall be as gradual as is possible." The old buildings would not all be removed at once, but those on part of the site will be allowed to stand until the new blocks on the remainder are ready for occupation. Arrangements had also been made for giving an option to the Commissioners' tenants of becoming occupiers of rooms in the new buildings at moderate rents, and by these means no large number of the tenants will be disturbed at one time. Tenements becoming vacant will not be relet, and thus a number of houses and rooms in the old buildings will be available for temporary occupation by those who had had to leave the houses cleared for removal. The committee think that some further portion of the estate may be appropriated for erection of labourers' dwellings of a similar character. Concluding their report, the committee say:—"In dealing with the matter referred to them, the committee felt bound not to overlook various social and public aspects of the question as to the provision of artisans' or labourers' dwellings. Without touching further on these larger bearings of the subject, they may say that they are fully aware of the considerations often urged in favour of diminishing the density of the poor populations in the centre of London by encouraging their migration to the suburbs. They think, however, that the special local circumstances afford good reasons for adopting in this case the policy which is being followed by the Estates Committee. They find one strong recommendation of this policy in the fact that it is in substance an application of the principles sanctioned by the Legislature in the passing of the Artisans' Dwellings Acts.

A Permanent Hospital for Newbury, Berks, is proposed to be erected. Substantial donations have already been received towards the cost of erecting a suitable building.

## A FIREPROOF PAINT.

A MEETING of the Royal Scottish Society of Arts was held in Edinburgh on Monday last, Professor Swan, president, in the chair. Mr. S. B. Wilkins, firemaster, read a paper, descriptive of a fireproof paint which he has invented. Within the last few years there had, he said, been different paints introduced for the purpose of resisting fire, and several large buildings had been coated with them, and a number of very successful experiments made. Among the objections raised against these paints were that when they got dirty they would not stand washing, and that when woodwork was once coated with them, oil paint would not dry on them. They were also very expensive, and did not keep their colour long when exposed to a strong light. His invention was particularly serviceable for painting all woodwork in connection with the roof, stage, and scenic appliances in theatres, and other places of amusement, and would also be found invaluable where wood was extensively used in the construction of stairs, hoist ways, the shelving and lining of rooms, and in painting offices and public buildings. It would also exclude insects, and was non-poisonous; and the painted woodwork could be washed by having a coat or two of oil-paint over the fireproof composition without in any way destroying its properties as a fire-resisting material. There was no asbestos used in the manufacture of the paint. Mr. Wilkins subjected several pieces of wood coated with his paint to the action of fire, and all stood the test admirably. One piece was thrust into the heart of a strong fire, and after remaining for over ten minutes it was only blistered. A gas flame was applied to some half-dozen others for an hour and a half, but beyond being slightly charred on the outside there was no injury done to the wood, which had never taken fire. In one instance the paint was cut away from a part of the wood, so as to expose it to the flame in its natural state, but the fire made no progress whatever, the outer coating of paint proving sufficient to resist the heat. The cost of the composition, Mr. Wilkins stated, would be one-third less than of ordinary paint, and he expressed his belief that, with a paint-mill, it could be turned out with profit at from 12s. to 15s. per cwt. The chairman and other members of the Society spoke of the remarkable efficacy of the paint, as shown by the severe test to which it had been subjected, and Mr. Wilkins was advised to protect his invention by taking out a patent. The chairman also suggested that Mr. Wilkins should, in a future paper, disclose the ingredients of which his paint was composed, and the matter would then be referred to a committee. Mr. Wilkins expressed his willingness to do so, and he was then heartily thanked for his important communication, which, it was said, held out the prospect of bringing about a great diminution in the number of fires.

## WARWICKSHIRE BRASSES.

A MEETING of the Archæological Section of the Birmingham and Midland Institute was held on Wednesday. Mr. Charles Williams read a paper on "Warwickshire Brasses," in which he said his one great object was to place on record the local habitations of the brasses at present existing in Warwickshire. He was sorry to say that since the time Dugdale wrote the brasses had decreased to the extent of at least twelve. As to the origin of brasses very little could positively be stated. Haines considered that they were the development of the idea sown by incised slabs, and the process known as enamelling. Brasses seemed to have appeared in England, France, and the Low Countries about the same period—viz., the thirteenth century. The date of the earliest known incised slab was about the eighth century, whilst the art of enamelling was introduced into Europe about the close of the tenth century. The earliest brass recorded in England was that of Simon de Beauchamp, who died before 1208; and the earliest existing specimen was that of Sir John D'Albernon, of Stoke D'Albernon, Surrey, who died in 1277. The earliest recorded brass in Warwickshire was that of a lady, probably of the Astley family, who died at Astley in 1400; and the next in date was 1401, being that of Thomas de Beauchamp, Earl of Warwick, and his wife. There were many advantages to be derived from the study of brasses, and not the least was the ease with which they were able to put themselves in possession of accurate copies of them. Should they require an incentive other than the love of such antiquities, they might remember that England was the only country in which anything like a series of those interesting relics was to be found. Scarcely one was to be found in France, only one was known in Scotland (in Glasgow Cathedral), two in Ireland, and not more than six in Wales. The lover of architecture would find his reward in the knowledge to be obtained by the study of the various styles of architecture prevailing at different periods, as seen in the accessories, such as brackets, canopies, &c. To the genealogist it would commend itself as affording contemporary evidence not elsewhere to be found. To the lover of heraldry it would give many examples of ancient usage in bearing arms and many instances of heraldic design, such as a clevis or relus, which were sure indications of date, frequently

when all traces of letters or figures had vanished. From the style of the lettering of the inscription the date of the erection might be determined, frequently supplying a record of the founder and date of the building of a church. He ventured to assert that there was no finer encyclopædia of costume than that to be found recorded on the various brasses in this country. Added to that was their durability and convenience, representing, as they did, in plane, almost as much as sculptural effigies did in relief, without monopolising space, which might be more advantageously employed by worshippers. He thought they might arrive at the conclusion that memorials of the past, such as those he had referred to, might be looked upon with favour to take the place of many monstrosities which had marked the resting places of the dead. It was a duty they owed to succeeding generations to preserve all such memorials. He would suggest, as a first step in that direction, the proper education of the rising generation in the knowledge of what constituted our national antiquities, and in the amount of reverence which was due to all things artistic, more especially when that quality was combined with antiquity. It seemed to him the preservation of our national antiquities should form part of our system of national education, and he was sanguine enough to believe that the mind of a child would be as much strengthened by a knowledge of our antiquities, and of the works they commemorated, as a knowledge of "what was crusted port," which he thought would be very properly followed by an "abrasion of the cuticle." He was led to that opinion by the destruction he saw daily. Only a short time ago Birmingham went to some expense in fencing with handsome palisades the old burial ground at the top of Bordesley Street, so as to utilise the space as a breathing ground for the people, but at the present time hardly half of the tops of the palisades were left. That was the same spirit which led to every other mode of disfiguration, whether it might be the removal of the noses of the knights or the inscribing on our monuments the illustrious names of Smith, Jones, and Williams. In conclusion, he gave an interesting description of the vast majority of the brasses to be found in Warwickshire, and illustrated his remarks by a large number of "rubblings" from the various brasses. At the close a hearty vote of thanks, on the motion of the chairman, seconded by Dr. Langford, was accorded by Mr. Williams, and the meeting then terminated.

## The Law of Arbitration.

SIR,—Referring to your Note on the recently-decided case of *Frazer & Co. v. Ehrensperger & Eckenstein*, it does not appear to me that what you recommend, viz., "some clear legislative enactment" is required to clear the point in question. All that is necessary to be done to prevent revocation is, that all voluntary submissions should contain the consent of both parties that the submission be made a rule of Court by either party without the consent of, and without notice to, the other, and the submission should so be made a rule of Court before either party revokes. Once made a rule of Court neither party can revoke.

In the above case the agreement contained a provision to make the submission a rule of Court, but the mistake on the part of the plaintiffs was that they did not make the submission a rule of Court until after the defendants had revoked, and until after the so-called award had been made.

15 Leadenhall Street:

Yours, &c.,

March 22, 1884.

A. HARSTON.

[The recommendation in the Note came from the Master of the Rolls.]

## The Health Exhibition.

SIR,—You would be doing a public service if you could call attention to the question of space allotment at the International Health Exhibition. I am fully aware that it has become necessary to cut down the applications and to limit the space asked for. But surely some regard should be paid to the class of goods proposed to be exhibited. This does not appear to have been done. The result is that many persons will find it utterly impossible to exhibit the goods they have specially manufactured for this purpose. What system has been adopted I cannot tell; but certainly, if it was necessary to cut down the spaces, all the spaces in a particular class should have been made the same size, that is, manufacturers of the same class of goods should have the same size space allotted them. Then all would be placed upon the same level of advantage. Now some have 30 feet, some 20 feet, and some 10 feet—all manufacturers of the same goods and of about the same standard.

Yours faithfully,

Birmingham: March 25.

D. CLARKE.

**Wood Block Flooring.**

SIR,—The attention of our client, Mr. Thomas Wharam, of Hyde, has been drawn to a paragraph in your issue of the 22nd inst., from which it would be gathered that Messrs. Andrews & Co. were in possession of the improved system of wood block flooring therein mentioned.

Such, however, is not the case. Mr. Wharam is the patentee, and Messrs. Andrews & Co. were his agents until the 6th inst., when all business connections with them ceased.

Kindly insert the explanation in your next issue.

Manchester :

Yours truly,

March 25, 1884.

BROOKS, MARSHALL & GORDON.

**LEGAL.****High Court of Justice.—March 24.**

(Before Mr. JUSTICE MATHEW.)

ISAACS v. HARDY.

**AGREEMENTS FOR PICTURES.**

The plaintiff in this case is a picture dealer of Bond Street, and the defendant is an artist. In January of last year, the defendant agreed to paint for the plaintiff a picture of dogs and game for the price of 125/. From time to time the plaintiff called upon the defendant and saw the picture while it was in progress, and in May he sent a frame, into which the picture was set. On May 29, the defendant called upon the plaintiff and offered him 20/ if he would let him off his bargain, but this the plaintiff would not agree to, and in the result the defendant refused to deliver the picture, and the present action was brought to recover damages for the breach of the agreement. The plaintiff stated that he could have sold the picture for 250/; he had before sold one of the defendant's pictures, for which he had paid him 60/, for 180/. The defence of the Statute of Frauds was relied upon. Although some letters had passed between the parties they did not contain a memorandum of the contract, and there had been no part payment.

It was urged for the plaintiff that this was really a contract for work and labour, and not for the sale of a chattel.

His Lordship, however, held that the picture when once brought into existence was a chattel, and was therefore within the Statute of Frauds. As, however, the defendant had by his defence denied that any contract had been made at all—and he was clearly of opinion that a contract had been made, though it had not been reduced into writing—he should dismiss the action, but without costs.

**WORKS IN PROGRESS.**

**The General Hydraulic Power Company** have now laid on their mains for the supply of water at a pressure of 700 lbs. on the square inch, and the directors of the City Offices Company have availed themselves of this power for working their passenger lift at 39 Lombard Street, which has been running very successfully for the last year. The necessary alterations have been entrusted to Messrs. R. Waygood & Co., of Falmouth Road, S.E., who erected the lift on their patent balanced principle. Messrs. R. Waygood & Co. are also erecting their patent balanced lifts to be worked from the same company's mains, at the City Conservative Club, George Yard, Lombard Street, and Woolpack Buildings, Gracechurch Street.

**Messrs. W. H. Lascelles & Co.**, of 127 Bunhill Row, have just completed a large range of stabling at Seward Street, Goswell Road, for the contractor for the Parcel Post. The ground floor of buildings is open for standing place for vans; the first and second floors are for the accommodation of 260 horses. In the centre of one of the ranges and above the entrance are harness, lamp, and engine-rooms, and over these are the chaff-cutting and crushing machines, with store-rooms for hay, corn, beans, and bran, extending right and left. All the machines, and the crane for hoisting forage, &c., are worked by two  $3\frac{1}{2}$  horse-power gas engines. On the ground floor are shoeing forges, smith's shop, boiler house, mess room for men, medicine room for veterinary surgeon, and in the gateway is office for clerks. The person in charge will show the stables to visitors who take an interest in that class of construction.

**Messrs. Hayward, Tyler & Co.**, of Whitecross Street, E.C., have been awarded the gold medal, three silver medals, and three bronze medals for the excellency of their manufactures exhibited at the Calcutta Exhibition.

**Burton-on-Trent.**—An incident connected with well boring operations, which may probably interest those who are concerned in matters of water supply, has recently taken place at Burton-on-Trent. A well-known firm of brewers, finding it necessary for

their purposes to obtain a larger water supply, gave instructions to a local well-sinker to carry out the work. After sinking to a depth of 176 feet without any satisfactory result, they determined to consult Messrs. Legrand & Sutcliffe, artesian well engineers, of Bunhill Row, London, who have had considerable experience in this branch of engineering at Burton. These gentlemen advised the abandonment of this site and the selection of a fresh one. Their advice was acted upon, and at a distance of about 200 yards from the first site, at a depth of 114 feet, a supply of between 5,000 and 6,000 gallons per hour was obtained from a 5-inch tube well. The level of ground in both cases was about the same, and the geological formation was the new red marl, containing bands of gypsum, which latter give that peculiar character to the Burton water which is so much prized by brewers.

**ART WORKMANSHIP.**

**Caen Stone Pulpit.**—St. Martin's Church, Desford, Leicester, has been enriched by the addition of a handsome pulpit, which is of Caen stone. The top contains three panels, which are filled respectively with figures of Our Lord, St. John, and St. Martin. The caps of the panels are supported by marble columns, and the whole is surmounted by a richly carved cornice. The work was executed by Messrs. Jones & Willis, of Birmingham and London.

**Mosaic Work, &c.**—A mosaic reredos has recently been erected in memory of the late Mr. J. Horsfield, at St. George's Church, Hyde, near Manchester. In the centre is a light red marble cross on a cream-coloured ground, surrounded by passion flowers. On either side of this are two heads of the four evangelists on gold grounds, the panels containing them being divided by the vine and corn. There are also two mosaic panels on the right and left of this, containing the figures of Melchizedec and Aaron in colour on gold grounds. A four-light west and two vestry windows have been also presented. The west window is presented by Mrs. Horsfield, of Longlands, in memory of her husband and second son. It contains the four principal introducers of Christianity, one in each light, namely, St. John the Baptist, St. Paul, St. Peter, and Cornelius, the centurion. One of the vestry windows is presented by Mrs. Payne in memory of her husband, the subject being *Christ Healing the Blind Man*, and the emblem of St. Luke. The other, presented by Mr. R. Hall in memory of his wife, contains the figure of St. Elizabeth and the Agnus Dei. Each window has its subject surrounded by delicate ornamentation. The windows and mosaic have been executed by Messrs. R. W. Winfield & Co., of Birmingham, from designs by Mr. T. W. Camm.

**ENGINEERING WORKS.**

**Cardiff Waterworks Extension.**—The first sod of these works was cut by the Mayor and Corporation of Cardiff on the 14th inst., when Mr. Bird, the present Mayor, turned the first turf of the Llanishen Reservoir with a silver spade, presented to him by the engineer. This storage reservoir, which is situated four miles from Cardiff, and is capable of holding 300,000,000 gallons of water, is part of an extensive scheme for supplying Cardiff with water direct from Taff Fawr on the Brecon Beacons. The total cost of the undertaking is estimated at 300,000/., and includes a 24-inch gravitating main from Taff Fawr to Llanishen, the construction of compensation reservoirs on the line of route, and the storage reservoir at Llanishen. The works were designed by Mr. J. A. B. Williams, A.M.I.C.E., of Cardiff. The contract for the Llanishen Reservoir is let to Messrs. Hill Bros., of Beckenham, for 53,000/. The contractors' engineer is Mr. J. C. Dudley, and the clerk of the works is Mr. J. T. Jones.

**CHURCH BUILDING AND RESTORATION.**

**Darlington.**—A new Methodist church has been opened. The building has been erected in French Gothic style at a cost of about 4,000/. The works have been carried out by Mr. H. Dougill, builder, of Darlington, from the designs of Mr. A. H. Goodall, architect, Nottingham.

**Tunstall.**—The foundation-stone of an eastern extension of Christ Church, Tunstall, has been laid. When the additions are complete the extreme length of the church from east to west will be 104 feet, and the width of the transept from north to south 66 feet, the nave being 42 feet wide. The contract for the extension has been let to Mr. J. Proctor, of Tunstall, for 2,200/., and tenders for the renovation of the existing fabric have still to be obtained. Mr. A. R. Wood, of Tunstall, is the architect.

**Trowbridge Tabernacle.**—This chapel has been reopened after extension. The external walls are of Bradford (Wilts) stone,

faced in random-coursed work, and the dressings are of a superior local freestone. The roofing is slated. The total cost of reconstructing the chapel, remodelling the school-buildings, and erecting ten new class-rooms, including all furniture, and organ, and stained glass, and laying-out the extensive grounds of the tabernacle premises, and architects, and clerk of works, and everything, is 8,400*l*. The architects are Messrs. Paull & Bonella, London and Manchester.

### SCHOOL BUILDINGS.

**Great Harwood.**—New schools are about to be built at Great Harwood, near Blackburn, in connection with the Methodist free church. The buildings will be used for day and Sunday-school purposes, to accommodate 1,000 scholars, and will consist of a large school-room with seven class-rooms adjacent thereto, and an infants' school for 150 infants. The plans have been prepared by Messrs. Maxwell, Tuke & Hurst, architects, Southport, and the works will be carried out under their supervision.

**Thackley.**—A new school has been erected at Thackley for the Idle School Board, from the designs of Mr. Jowett Kendall, architect, of Idle. The schools are arranged in two departments—mixed and infants—accommodation being provided for 250 children in the mixed department and 200 in the infants'. The style of architecture adopted is Gothic. The cost of the buildings is 2,950*l*., making, with the cost of the site, a total of 3,676*l*.

**Thorpe.**—A school has been erected for the Idle School Board. The style is Gothic. The accommodation provided is for 630 children, in two departments, mixed and infants. The contractors for the principal works were Messrs. Obank & Sons, of Idle. The plans were prepared by Mr. Wilson Bailey, architect, Bradford. The cost of the buildings, covered playgrounds, and boundary walling has been 3,100*l*., and the cost of the site 1,150*l*., making a total of 4,250*l*.

**Windhill.**—A new school is to be erected for the Idle School Board at Windhill, to accommodate 450 children. The plans are being prepared by Mr. Sam Wright, architect, Shipley.

### NEW BUILDINGS.

**Goole.**—A sailors' institute has been opened at Goole. The building has been erected at a cost of 1,600*l*., and is situate in North Street. It is of brick, in the Tudor style of architecture. The exterior, fronting North Street, has a pretty appearance, and contains three windows and pair of doors (the latter in the centre) on the ground-floor, and four windows on the second storey. The building internally is more commodious than it appears from the outside, for it contains six rooms on the ground floor, and one large room on the second storey. It is intended that the bottom rooms should be used as reading-rooms, &c., and the larger one upstairs for holding services in. The accommodation is as follows:—Ground-floor—Library or committee-room, reading-room, recreation-room, kitchen, cloak-room, with a room to hold 100 persons. The mission-room is on the second floor, and is reached by main staircase 4 feet wide, landing on vestibule at each side, also a private staircase 3 feet wide. It is lighted on all sides. The roof is open, with dressed timber. The work has been executed by Messrs. Jackson Brothers, contractors, Goole. The architect is Mr. W. A. Gelder, of Hull.

**Home for Incurables, Carlisle.**—The Committee of the Border Counties Home for Incurables have selected the design by Mr. G. D. Oliver, of Carlisle. The elevation shows a building of simple cottage type of Gothic character, picturesquely grouped and well set back on the site so as to show it off to advantage. The institution is planned at present for twenty beds, but so arranged that it can be extended as funds may permit or the necessities of the institution require. The central portion of the building is two storeys high, the centre being devoted to matron's sitting-room on the ground floor with bedroom above, staircase, and store-rooms. On each side of this central portion there will be, on the ground floor, a day-room and dormitory, one pair of rooms being devoted to men, and the other to women. On the first floor there are two wards planned for six beds each, one for males and the other for females, and each overlooked by a nurse's bedroom. On the ground floor in the rear of the apartments already named, there will be a large dining-room and a prayer-hall centrally placed, so as to be conveniently accessible both for the male wards and the female wards; and the kitchen block is well away from the main building, but at the same time very conveniently situated for the service of the dining-room. The whole of the ground floor, which is paved with blocks of wood, is on a level with the ground, so that patients may readily be wheeled out in bath chairs, and on the sunny sides of the building verandahs have been provided, into which the wards open, where patients may sun themselves and take the air in fine weather. The sanitary

arrangements have been planned upon the most improved principles, and great attention has been paid both to the heating and ventilation.

### TOWNS IMPROVEMENT.

**Kenilworth.**—A year ago the Local Board contracted to purchase the Abbey Fields Estate, consisting of about seventy-eight acres of land, with a house and nineteen cottages thereon, with the object of preserving the beautiful scenery around Kenilworth Castle, the purchase money being 16,450*l*. The Local Government Board held an inquiry, and a loan of 12,000*l*. was authorised, to be repaid within sixty years. In support of the application, evidence was tendered to the Government inspector that, by the sale of frontages to Abbey Hill, Rosemary Hill, and Bridge Street alone, 5,000*l*. could be realised. Notwithstanding the sanction to borrow 12,000*l*., the Local Board felt that it was undesirable to borrow more than 5,000*l*.; but there is a desire not only in Kenilworth, but in the county generally, to avoid building on the frontages to Abbey Hill, Rosemary Hill, Bridge Street, and High Street, and a fund is being raised by voluntary subscriptions, to be applied in securing the necessary extension of the churchyard, and towards the purchase-money and the cost of improvements on the estate. It is believed that if 6,000*l*. can be raised, the sales of frontages may be limited to parts of the estate where building would not obstruct the view or deteriorate the scenery, and that the beautiful views of the Castle from Abbey Hill, Rosemary Hill, Bridge Street, and High Street will be left uninterrupted, upwards of sixty acres of land will be preserved for public walks or pleasure grounds, and about two acres will be added to the churchyard, and the necessity for a cemetery avoided.

**Margate.**—Messrs. Joseph Brown & Son, contractors, Margate, have begun the works for the proposed erection of the Marine Palace and Swimming-baths. The swimming-baths, two in number, will form one building 240 feet in length by 80 feet in breadth. The Marine Palace will be 142 feet long, and have an average breadth of about 60 feet. When the plans have been carried out in their entirety there will be a range of buildings about 700 feet in length, and along the whole distance will be open and covered promenades. The premises will be connected with the jetty by an iron lattice girder bridge, 10 feet in width. The architects are Mr. Mr. Thomas Andrews and Mr. Latham, the borough surveyor.

### GENERAL.

**The International Health Exhibition** will be opened by the president, His Royal Highness the Prince of Wales, on Thursday, May 8, at 3 P.M.

**The Original** of Raphael's *Madonna* of Loretto has, it is said, just been discovered in the Museum at Hyères.

**The Society of British Artists** have elected the following new members:—Mr. Jacomb Hood, Mr. Walter J. Morgan, Mr. Edward Elliot, and Mr. C. W. Wyllie.

**Mr. John Mason**, of Bilston, has offered to give his collection of paintings, numbering about sixty, to the town, as a nucleus for the formation of an art school or gallery.

**Mr. Herkomer, A.R.A.**, has exhibited at Messrs. Goupil's Gallery his *Pressing to the West*, with portraits and etchings.

**The Clothworkers' Company**, who have already given 3,500*l*. to the Bradford Technical School, have promised an annual subscription of 500*l*. towards the working expenses of the school.

**A Dwelling-house** in High Street, Spilsby, the birthplace of Sir John Franklin, was lately submitted to auction, and withdrawn under a reserve of 800*l*., the highest bid reaching only to 540*l*. The property, it is stated, was purchased some years ago by Lady Franklin for 2,500*l*.

**Duncombe House**, the mansion of Lord Feversham, is to be rebuilt from the designs of Mr. William Young.

**The Students** of the engineering classes of the Edinburgh University and the Watt Institution on Saturday last visited the Forth Bridge works, under the direction of Mr. Fairweather, C.E., B.Sc.

**A Peal of Bells** has been presented to St. Edmund's Church, Northampton, by Mr. W. Tones of that town.

**Tenders** for the erection of St. Bartholomew's Grammar School, Newbury, are to be obtained.

**Messrs. Stiff & Sons, Lambeth**, have been awarded a gold medal for architectural terra-cotta at the Calcutta Exhibition.

**Messrs. Legrand & Sutcliffe** have been awarded a first-class certificate and silver medal for their Norton's "Abyssinian" tube-wells and pumps. The exhibit was not in itself an elaborate one, but all appliances bearing upon the great question of irrigation are of paramount importance in India.

# SUPPLEMENT

TO THE

# ARCHITECT.

LONDON, MARCH 29, 1884.

## THE BUILDING TRADES EXHIBITION AT THE AGRICULTURAL HALL.

THE general arrangements of the Exhibition evince an amount of business capacity well worth imitation. Reverting to the exhibits, although, as we remarked last week, many changes are visible, we cannot say the appearance of the Hall lacks interest in comparison with previous years. Constructive materials appear as prominent as heretofore, though partly contributed by different firms, and wood working machinery and materials are fairly represented. The various appliances that help to make up interior decoration and their constituents are well worthy of careful observation, and ventilating and sanitary apparatus are to be seen in their most approved forms. The galleries—as was the case last year—contain a large collection of architectural drawings, many of which portray works carried out by well-known names, while others are studies, by new aspirants for fame, of different classes of buildings. If the martinet complains that there are exhibits not in strict consonance with the objects of the Exhibition, the answer must be that they are but few, and, if not strictly allied, are more or less attendant upon its primary features.

### Jaffrey's Patent Grate Co.

Amongst the new exhibitors may be mentioned JAFFREY'S PATENT GRATE COMPANY, 6 Charing Cross, who exhibit a patent grate that has already attracted some attention in other quarters. The invention of a gentleman at Manchester of the name mentioned, it was first introduced to public notice at the exhibition of smoke-abatement appliances held there in the spring of 1882, and its performances were so satisfactory under the tests carried out by Mr. D. KINNEAR-CLARK, the engineer appointed for that purpose, that a silver medal (the highest award given to any appliance exhibited there) was granted it. Since that time alterations have been made in it tending still further to increase its efficiency, and it is now introduced into the London market by the company that has recently been formed for developing the invention. By the aid of the two accompanying illustrations, our readers will be enabled to follow us in our description of its principal features. It is offered to the public as a smokeless, slow-combustion, and bright-glow grate, for either bituminous or anthracite coal, and it is remarkable for the rapid changes that can be effected from the one to the other of these applications. It has three actions. When first lit, the ordinary valve or register, which is balanced in the centre instead of at one of its ends, is opened, and a direct communication with the chimney effected. This, however, need only be continued for a short time, until the fire begins to show signs of vitality, when it may be closed, and a bright-glow, or slow-combustion fire, be obtained. This is effected by the peculiar construction of the grate. The body is composed entirely of fireclay, with a solid bottom, the back being formed of loose bricks of a semicircular form, projecting outwards, with interstices between them of about half an inch; and all these, including the body of the grate, can be taken in or out at pleasure. When the valves are closed, the smoke or gases from the fuel are mainly drawn through the openings we have mentioned into a combustion chamber at the back; but any that may be carried upwards have to pass down a flue at each side of the grate into the combustion-chamber before mentioned,

where, in connection with the great heat they come in contact with, they are mainly consumed ere they pass to the chimney. A second valve at the back of the grate opens or closes the entrance to the chimney from this part; and on this, shown by the letters b k in the sectional drawing, the slow-combustion

or bright-glow fire is mainly obtained. Although shown with a front in our illustration, the grate is made complete in itself without one, so that any style may be used for it, according to taste or circumstances; and it can also be arranged to receive fresh air from the outer atmosphere, and deliver the same into the room at any needful temperature. As a non-smokeless open grate it is certainly much in advance of most others, and as the only mechanism is the two valves, which are of the simplest order, there is nothing to interfere with the proper working at any time; and the ease with which the entire body (of fire-clay) can be taken to pieces, even to the iron shell, new pieces can be put in whenever they wear away by any unskilled person, and the whole laid bare for sweeping out or cleaning. We may also add that, as in the case of all grates composed of fire-clay, it throws out great heat, and, used as a slow-combustion one, is a great economiser of fuel.

### Messrs. Hindley & Sons.

We are always led to expect an artistic display at the stand of Messrs. HINDLEY & SONS, of Oxford Street, and the firm have not disappointed us, although they have on this occasion confined it entirely to chimney-piece suites, and Japanese leather wall decoration. In all six suites are shown, and they are arranged in a tastefully-designed stand, covered with a handsome English-made light chintz pattern, with suitable frieze, &c. The mantelpieces are all of pine wood painted in different colours, from designs by Mr. C. A. BEVAN, who has gained great popularity as an artist in interior decorations. The aim of the firm has been to show the very economic price at which a really artistic and well-made mantelpiece can be turned out by first-class London workmen. In design, while mainly following the style of ornament appertaining to the "Queen Anne," the artist has endeavoured to free them from what we may term the "severe" lines attendant upon it. The centre one is a full-sized mantel and over-mantel in ivory white, containing four cabinets, with bevelled plate-glass doors the back of the other portion of the over-mantel being lined with plush, the shelves being embellished with a chaste selection of pottery. A Berlin black hob-grate of suitable design, flanked with Bardella marble slips, completes the suite, the

intense black of the grate throwing the creamy tint of the mantelpiece out in strong relief. There is another full-sized one of the same colour with one cabinet and an oblong plate-glass mirror, and a variety of shelves for ornaments. The back of this is lined with a dark olive-green plush. It is also fitted with a Berlin black hob-grate, and forms a most attractive suite. A very pretty boudoir suite is also noteworthy, the colour being that popularly known as a duck's-egg green. It is fitted with a circular mirror with bevelled edges, the panels of the over-mantel being lined with Japanese paper. A small quaint grate lined with fire-brick, and flanked with "Rouge girotte" slips, accompanies this. A fourth set is adapted for a dining-room or library, and is coloured in one of those new neutral tints so difficult to exactly define. In saying it is somewhat between a slate blue and a peacock blue we give the best illustration we can. The panels of this are lined with Japanese paper, an oblong bevelled mirror, oblong in shape, adorning the over-mantel, which also contains brackets, &c., for ornaments. The popular crushed-strawberry colour has not been overlooked, the remaining two being coloured in that tint. One of these is a boudoir set, fitted with a slow-combustion grate and pale green tiles, and the effect is remarkably good. The other, the most simple in the exhibit, is intended for a bedroom, and with a neat canopied slow-combustion grate can be sold, we understand, at the low price of 3*l.* 5*s.* The Japanese leather decorations, for we cannot call them paper, as they are made from a fibrous material, composed, we believe, of the bark of trees, are all from the Government manufactory, and have been introduced by the firm for the purpose of competing with decorations of a somewhat similar character that are manufactured here, and have attained much popularity. They are, perhaps, better adapted for dados than for entire wall-covering; the designs are good and very effective; some with old gold grounds and floral patterns will no doubt meet with many admirers. Messrs. HINDLEY were one of the first firms to introduce us to Japanese papers, and have done a great deal to familiarise us with them, and they appear equally determined to lead the van in the new style of decoration from that distant region.

#### Messrs. J. M. Lamb & Co.

Messrs. J. M. LAMB & Co., Sanitary Ventilating Engineers, 119 Finchley Road, N.W., who have recently come to the front in this class of appliances, have a well-filled stand composed of their different specialities. A complete collection of their "Triumph" ventilators form the most prominent feature. These are made in various sizes and for varied uses. For houses and factories they are shown with single, double, and treble rows of exhaust openings, with smaller ones adapted for soil-pipes, railway-carriage roofs, &c. Our illustration shows a double one, and its shape and arrangement applies to all.

There are also three different patterns of the "Triumph" smoke-curing chimney-cowls. Noiselessly rotating on a hardened steel spindle in a cup of the same material, they are constructed with a set of guides that conduct the air over the mouth of a fixed cone in a concentrated spiral form, and a revolving cone-head divided into segments that collect all the air with which they come in contact, twisting it over the mouth of the cone and condensing it to double pressure, making the centre of the ventilator the strongest point of action, and

causing it to draw off the vitiated air on the off side. The inventors claim that the exhausting power of the "Triumph" ventilator exceeds that of any other ever invented, and that only a powerful up-current can exist wherever they are fixed. The power is increased by adding to the tiers of cones, each one clearing the row below it, and when once fixed they require no attention but an occasional oiling. The chimney-cowls are guaranteed to be proof against the entry of snow or rain, and noiseless in the heaviest gale. A new smoke-curing cowl is exhibited here for the first time, called the "Standard." It works in a similar manner to the "lobster back," while retaining the general feature of the "Triumph," and is said to have effected its purpose in a most satisfactory manner in all the experiments to which it has been subjected. Another new invention shown by Messrs. LAMB & Co. is a patent "Tripod" cowl and ventilator. This is a fixed appliance intended to meet the objections of those who object to movable apparatus of this class. The action is necessarily automatic. The wind that is blowing to terra-firma is conveyed through both ventilator and cowl, but exhausts itself through a powerful compressed descending current of air, which produces through the various discharge openings a strong induced up-current. They are shown in three kinds, and appear to produce a great amount of free exits for smoke while the wind appears to be driving down the flue. Soil-pipe ventilators on this principle are also exhibited. Mr. LAMB has just taken out a patent for a new centrifugal fan, seen here for the first time. It requires to be driven by steam or some other motive-power, and is intended for removing or displacing large bodies of air in mines, tunnels, &c. It is very light, and requires but a small amount of power to drive it, and it is claimed that it will effect a greater change in the atmosphere than any of its class now in use.

#### Mr. Wm. Brass, Jun.

Mr. WM. BRASS, jun., 47 Old Street, St. Luke's, shows his improved patent pavement lights and patent plaster ceiling slabs. The former, though comparatively new, are becoming well known. We append an illustration, however, which shows at once its action and use. A series of silvered glass reflectors

(weather proof), with waved or fluted surfaces to render them as powerful as possible, are attached to the under or inside of the pavement, stallboard, or stair-tread grating, as the case may be, and being hung on centres, and having connecting rods at each end, can be adjusted to any angle required, and so diffuse the light into an underground apartment to the best possible advantage. A very important feature that must not be passed over in Mr. BRASS's pavement lights is the special arrangement made for suspending the reflectors in positions in which the depth of lintel below pavement level, or some other obstacle, renders the old form of pavement lights next to useless, so providing daylight to apartments that have hitherto been complete strangers to that commodity. The improved slab plastering shown at this stand has advantages that should not be lost sight of. It is composed of plaster and fibre with stout canvas as a strengthening medium. It is made about half an inch thick, and for ceilings is supplied in slabs three feet square, but it is equally applicable for girder casing and other purposes, and can be had any required size. The saving in time is very

considerable, as it dispenses with the two first stages of the plasterer, it merely requiring to be nailed up and then finished off.

**Messrs. Waygood & Co.**

Amongst the several new industries that have of late years obtained a prominent position, and that the altered condition of our surroundings will probably increase for a long time to come, is that of lifts and hoists. Messrs. WAYGOOD & Co., Falmouth Road, S.E., who are exhibitors here, have attained a position second to none in their manufacture, and the articles on view are composed entirely of these appliances, and the gearing connected therewith. In using the term "lift" we adopt a word of expansive character, for it is applied indiscriminately to the most simple contrivance for raising food from the kitchen in a private house to those for enabling us to be carried from floor to floor in a high range of buildings, or for transporting heavy weights in warehouses from basement to roof. It must be evident to all that such appliances in which human life plays a conspicuous part should be not only securely guarded against accident from falling through openings, but that the machinery should be of such a nature as to render danger to life or limb impossible in the event of anything becoming wrong in the propelling power. It is not every arrangement in connection with these necessities that can boast of this immunity, and the public prints from time to time place on record accounts of accidents that ought not to be possible of occurrence. The lifts made by this firm can be supplied to work by hand, gas, steam, or hydraulic power, of any required size, and in the case of those for hotel use upholstered in the most luxurious manner. Our illustration depicts a small patent hydraulic balanced lift, of which large numbers have been erected in London and the provinces.

Should our readers wish to see these appliances at their everyday work, a visit to the City Offices Company, 39 Lombard Street, or to Eastcheap Buildings, Eastcheap, they will no doubt be gratified. They are especially adapted for fixing in the well-hole of a staircase. No head gear being required, the appearance of the staircase is preserved, no light obstructed, and absolute safety, the most important feature of all, is obtained. Two useful points gained by the use of these lifts is smoothness of action and increased speed without danger. Some of them, now in course of erection in the metropolis, are being arranged to be worked from the high-pressure mains of the General Hydraulic Power Company, for which they are specially suited, on account of the economy

effected in the quantity of water used. Another example exhibited is a hand-power lift, fitted with the firm's patent self-sustaining brake, securing again perfect safety against accident. This can be arranged for ropes or chains, though the former are recommended. By simple mechanism the load is held stationary immediately the hauling-rope is released, which obviates the necessity of a separate brake-rope; and in the event of the rope breaking the safety apparatus is at once brought into action, which may be thus described. On each side of the box two wrought-iron plates are bolted, with a vertical slot in each, in which the crossbar at the top of the box works; and until this reaches the top of the slot the box is not lifted. When it has arrived at this position it distends four cams, viz. two on each side, and should the rope break the bar drops of its own weight, and, to make security more sure, two strong springs act upon the cams, grip the uprights, and the cage or box is suspended in almost the position in which the breakage may occur. A double dinner-lift of somewhat similar arrangement is also exhibited, the brake acting equally well upon either box whether loaded or empty. A single dinner-lift worked from below by a handle and suitable for private houses, capable of carrying as much as 84 lbs. at one time, and of a very inexpensive character, completes the collection of these appliances, and the exhibit is supplemented by two complete sets of gearing, showing the whole of the media employed, and which the firm keep in stock, to suit cages from one to three feet square and for weights up to one and a half hundredweight. Very complete catalogues are issued by Messrs. WAYGOOD & Co., containing a number of illustrations of hoisting machinery suitable for the most diversified uses.

**Messrs. Candy & Co.**

At Stand No. 210, Avenue F, Messrs. CANDY & Co., Limited, of Newton Abbot, Torrington, and Bideford, Devonshire, have an excellent display of their terra-cotta facing bricks and brick ornament, and other articles made of their celebrated clays. There is probably no finer material found in these islands than Messrs. CANDY can boast of in their various properties, and the supply is so apparently inexhaustible that it places them in a position as regards price, when we take into consideration the imperishable nature of even their ordinary bricks, that they may be said to compete in price with the most inferior makes, and for many of the uses to which carved stone is now applied in buildings, their terra-cotta can be supplied at such a price that is bound to cause the former to be displaced in the market to a great extent. These clays are rich in silica, showing by analysis to contain as high as 87 per cent., whereby twisting and warping is avoided, and the material can be safely fired until it becomes a non-absorbent and semi-vitreous body, with the advantage of retaining its colour and freshness which can either be had in white or warm tinted buff. The firm are enabled to supply a facing brick of

the quality we have named suitable for best work as low as 42s. per 1,000. In ornamental work the great economy of the material is still more apparent. A truss of the size depicted in the accompanying illustration of this imperishable terra-cotta can be delivered in London for 2s. 6d. The cost of carving such a body in stone would, we believe, cost about four times as much, and drip bricks of the character of the one illustrated can be supplied at a proportionate price. Architects cannot fail to appreciate the value of this material for their work, not only as regards price and lasting qualities, but on account of the saving of time effected over that taken up in the carving of stone. As a proof of the

astonishing hardness of these clays, they are yearly exported in their crude state in large quantities to different parts of the kingdom and abroad for the manufacture of chemical-holding vessels, the most powerful acids and alkalies, as well as the most severe frosts, having no injurious effect upon them. KIRKALDY'S tests have shown that CANDY & Co.'s facing bricks resisted a crushing pressure of over 440 tons per square foot, which is double that of ordinary building stone, and for these and their other advantageous features they have been selected by the Government for the construction of docks. Another use to which this non-absorbent brick has been extensively applied is for the paving of stables, &c., their white colour materially assisting the light for these purposes. We append an illustration of a pattern mostly used, and we understand

the London General Omnibus Company are now generally adopting them. For footpaths, steps, &c., they are equally applicable, and the variety of patterns in which they can be made without additional cost is likely to render them more popular. Our illustration gives a favourite design, the prices

being about that of the common Staffordshire blue brick. The firm are also most extensive manufacturers of salt-glazed sanitary pipes and traps of all descriptions, which are also shown in their many varieties, and these being made from the same clays, our previous remarks apply equally to them. Besides the clay we have mentioned their estates contain a very valuable body of fireclay, which is made into the various articles for which that substance is used, and has been

supplied both to the English and foreign Governments, various gas companies, Portland cement works, &c., being particularly suited for intermittent heat, and for resisting the destructive action of salt glazing in pottery, kilns, and chemical works. Numerous medals have been awarded the firm for their general superiority, and a few minutes devoted to an examination of this stand must result in advantage to those interested in this class of manufactures.

#### Messrs. Archibald Kenrick & Sons.

Messrs. ARCHIBALD KENRICK & SONS, Limited, of West Bromwich, occupy as last year a central position on the ground floor, and is so arranged that both the in and outside of a square erection is utilised for exhibiting the many articles coming under the head of builders' ironmongery and domestic articles in cast iron manufactured by the firm. Covered with a chocolate-coloured cloth, giving an air of extreme gentility to the exhibits, the erection is divided into panels, on which are arranged, in some instances in a most artistic manner, the different examples of their art. Commencing with the most inartistic articles, there are several examples of HATFIELD'S patent rollers for heavy doors, too well known to need detailed description here. Hinges of all descriptions that are made in cast iron, from the smallest butt to the largest of the same class, are arranged to please the eye, and the larger kinds of ecclesiastical and mediæval design form a separate group. The somewhat uninteresting, but nevertheless useful, "pulley" is shown in the many forms and sizes in which it is manufactured, and is robbed of its unattractive character by the manner in which the various examples are displayed; and the firm call particular attention to their patent secret axle pulley, that offers great advantages over that of ordinary make. This pulley, which is cast with its runner in one piece, is again used in casting the bearing, and by this means a chilled or hardened bearing is obtained, which causes them to run more easily, prevents friction, and lasts a much longer time. Arriving at the more ornamental kind of fittings, we find cabinet handles of all kinds and sizes, flush bolts, brackets, knockers; postal plates, which comprise a door-handle and letter-plates, the designs of which are equal to the most costly articles of the same character made of brass, and coloured in a variety of ways, including nickel-plating, electro-bronze, verd antique, &c., the designs being decidedly American in character—that is to say, the main portion of the pattern is sunk, the heavier lines being ground with a flat surface. This style of casting is very effective, and has found considerable favour on this as well as the other side of the Atlantic. A variety of patterns of ventilators of different shapes and sizes of the same style of casting illustrate a vast improvement on the old times, and there are several patterns of umbrella stands of light and elegant design, in which a combination of nickel plating and Berlin black or bronze are blended with much taste. The exhibit is supplemented with a variety of useful domestic and culinary articles and enamelled sanitary ware in sinks, lavatories, &c.

#### Messrs. Shanks & Co.

As manufacturers of baths, lavatories, and their accessories, there is probably no firm who has earned so large a reputation as have Messrs. SHANKS & Co., Barrhead, near Glasgow, and London. Retaining about the same position in the hall as at previous Exhibitions, they are showing at Bay 10 a well-selected collection of the above goods, as well as one or two new features which must not go unnoticed. Prominent among the latter is a patent water-waste preventer, adding to the already long list of these apparatus, and, though late in coming into the market, is by no means the least meritorious. It is on the syphon principle, and quite free from valves or complications that would render it liable to get out of order. The patentees claim it to be the most simple and certain of any yet introduced, and without endorsing that statement entirely—as we know many very simple and efficient ones—it will doubtless hold its own against any with which it may be brought into competition. Another novelty is a glazed fireclay wash-out closet and trap, all in one piece, the special advantages of which are its extra strength and consequent non-liability to breakage. The "Eureka" bath is again a source of much attraction, and though it has been described in our columns on previous occasions, as it possesses rather unique features, the reiteration of them will not be out of place. As will be remembered, it is one that combines plunge, spray, shower,

and douche, with fittings for hot and cold water, but instead of having sixteen pipes, as hitherto found necessary, only six are required. This is effected by means of a dial with an index, which merely has to be pointed to the name corresponding to the particular bath desired, and then by turning the hot or cold water on as occasion may require. There is thus a saving of piping and expense in fixing, as well as a saving of time to the person using the bath. Lavatories in a variety of designs, from the most costly to the least expensive, occupy a large portion of the stand, and with other kinds of baths, butlers' sinks, &c., maintain the firm's established credit for elegance, finish, and moderate prices.

**Mr. C. D. Phillips.**

The interest hitherto evinced in the patent lock-jaw tiles of Mr. C. D. PHILLIPS, Emlyn Works, Newport, does not appear to decrease. The position of the stand for obtaining a full view of the roof is a much better one than was occupied last year, and it is only paying a just tribute to the invention to say

that the ornamental merits of this tile are only second to the useful. We have illustrated two of them, Fig. 1 being a single grip, and Fig. 2 a double grip, the latter being the most suitable for exposed situations, and when they are finished with suitable ridges and finials, have, to say the least, a very ornamental

appearance. The salient features of the "Lock-jaw" tile, viz., the manner in which each locks into the other at top, bottom, and sides, and so secures a thoroughly wind and rain-proof roof, are now generally known, but it may be as well to mention that half-tiles are made, to hang next to a gable, in alternate course, similar to the mode of using closers to brickwork. No mortar is used with them, nor is skilled labour necessary. An important feature with the lock-jaw tile is the great reduction obtained in weight, which is about one-third that of ordinary tiles. That these advantages are fully appreciated the constantly-increasing demand for them testify.

**Messrs. Diespeker & Co.**

Mosaic flooring is contributed by Messrs. DIESPEKER & Co., of the Holborn Viaduct, and the examples are numerous and in most instances of a high order of merit. With their headquarters at Venice, and branches at Vienna and other Continental cities, the firm have ample opportunity of studying the works of the old masters, which they have not been slow to avail themselves of. Extending their operations to England by establishing a branch dépôt at the address named, they are making considerable progress here, many architects of repute having called their aid into requisition. Amongst the specimens shown is one as laid down at the Glasgow University, and at Hints church, near Lichfield, to the order of JOHN OLDRID SCOTT, Esq., F.R.I.B.A. This is a plain Roman border, with Pompeian corners and Roman mosaic centre. Another example is in Roman mosaic, representing a vine leaf, with border of the Elizabethan period, and Venetian (Mischiato) centre, as laid at the Hyde Park

Mansions, for Messrs. WHEELER & WARREN; a third specimen showing a Roman border, Moresque in style, as furnished to GATTI'S Music Hall, the architect being A. J. BOLTON, Esq., F.R.I.B.A. These are but a few of the very many patterns exhibited of equally good design, the blending of colours being strikingly harmonious. Besides these higher-class designs there are many of a less expensive character, all, however, being made of marble, as except for wall or ecclesiastical decoration, where glass is partly brought into requisition, the firm only work in marble. As an example of the low price at which the firm can supply a marble mosaic flooring, one is exhibited that can be laid down and finished for 8s. per yard, a price that will compete with the lowest class of tiles, and more durable. The cheaper kinds are as lasting as the highest-priced ones, the only difference consisting in the more elaborate design, all being laid in a specially-prepared mastic of Messrs. DIESPEKER'S invention, which renders the facing practically imperishable. The ecclesiastical designs are in some instances reproductions of well-known works by old masters, and show that workmen of no mean order are in the employ of the firm. Catering for the style at present in vogue in England, of introducing tiles and slabs into grates, some elegant designs of the latter are shown at prices, too, that will again compete with tile specimens. As an artistic display of one of the earliest arts this exhibit commands attention and respect.

**Mr. R. Adams.**

Mr. R. ADAMS, 7 Great Dover Street, S.E., occupies his usual position, which has been somewhat extended to enable him to exhibit a new patent improved fan opener, closer, and fastener, of which we give an illustration of the working parts. This demand for a less expensive opener than the one originally patented by Mr. ADAMS, of which an immense number have been sold, and will no doubt continue to be, when price is not an object, has led to the introduction of the present invention.

A jointed folding-rack as shown in the drawing is fixed above the fanlight, into which a worm is made to revolve by means of an endless cord passed through an ordinary rack-pulley, fixed and used as to a common blind. The fanlight can be made to open inwards or outwards, and from bottom or top, according to the manner in which it is hung, and the appliance offers a cheap and effective means of opening or closing "lights." Another new feature exhibited here for the first time illustrates an easy and inexpensive mode of altering existing windows to the principle of Mr. ADAMS'S patent "anti-accident window," enabling them to be swung and turned over for cleaning from the inside. This is effected by making a slit in the sash and in the sash frame, into which a metal tongue is slid, and that does not interfere with the opening of the window; at the same time it prevents draughts from finding their way through, and the window from shaking. The sash is also pivoted in the centre, and on withdrawing the tongues the sash can be swung as before described. This arrangement can be carried out at a small cost, and places any window so altered on the same basis as the "anti-accident." From the number of accidents that yearly occur through the dangerous practice of sitting outside, it is to be hoped that the contrivance will secure a large amount of patronage. We have in addition all Mr. ADAMS'S specialties, including the "panic door" door springs and check slams, improved Venetian blinds, and "Toby" cord holder, secure sash fasteners, patent lock furniture, &c., all of which have been mentioned in the columns of *The Architect*. There are also

specimens of cheap and good English-made rim and lever locks well worth the attention of builders. Mr. ADAMS has a fertile brain, which the many inventions exhibited (all his own) practically demonstrates.

**Messrs. C. Kite & Co.**

Messrs. C. KITE & Co., ventilating and sanitary engineers, Chalton Street, N.W., show that they are not behind their many competitors in the application of their system to different kinds of buildings. They exhibit several turret ventilators, and drawings of several others. Amongst the latter we may mention designs of those just finished for the new Warwick School Board buildings, in which the horizontal roof ventilator is made in a vertical form, at the suggestion of the architect, Mr. GEORGE H. COX, of Temple Row, Birmingham, and is arranged to prevent the admission of light, &c. Another turret is shown as made to the order of Mr. C. H. HOWELL, County Surveyor for Surrey. The examples demonstrate that the firm are enabled to assimilate their designs to different styles of architecture, while securing the free play of their special features. Their several features in drain and cess-pit ventilators, chimney-caps, &c., are also shown, and others for cow-houses, stables, &c. A further speciality, that has been thoroughly tested by the Sanitary Institute, and that has gained the medal of that body, is their improved chimney-breast ventilator, and the improved fresh-air inlet ventilator, which are shown below. The illustrations show the area over which the air travels, and

they are extensively in use. Amongst other architects Mr. ERNEST TURNER, F.R.I.B.A., and a member of the Council of the Sanitary Institute, has specified for a large number of them.

**Messrs. Wm. Woollams & Co.**

The collection of non-arsenical wall-papers shown by Messrs. WM. WOOLLAMS & Co., of High Street, Manchester Square, merit all that is claimed for them, both as regards their design and their non-poisonous and sanitary features. They consist in the main of wall-papers, dado decorations, raised flocks for painting over, patent embossed flocks, damask and chintz patterns on mica grounds, &c. The central object in their stand represents a handsome Italian brocade pattern designed by Mr. A. SILVER, printed in six different coloured flocks on a gilt diapered ground, and is a fine example of colour printing. A somewhat similar design to the right of this—though smaller in scale—is composed of flowers, leaves, &c., treated conventionally in shades of blue and green on terra-cotta, and arranged as a dado decoration, the design being by Mr. BERNARD DICKSEE. A most efficient and inexpensive decoration for corridors, staircases, &c., may be seen to the left, emanating from Mr. A. F. BROPHY, worked as a single print in shades of terra-cotta. At each "return" of the stand are two other dado decorations, both distinctly Italian in character, the one on the left having a panelled dado and a fine block damask filling taking a 36-inch repeat, from the pencil of Miss LOUISA AUMONIER, the one on the opposite side having a bold and striking frieze, flamboyant diaper filling, and geometric dado of Veronese character, and it finds an excellent companion in a rich, raised flock ceiling paper, specially designed for it, both having been drawn by Mr. H. NOBLE for the firm. A great number of other ceiling papers are also shown, the most striking of which is, perhaps, a design by Mr. OWEN W. DAVIS, with a repeat 42 inches by 42 inches. There are two very notable chintz papers, recoloured to suit modern requirements, from two very old, many-coloured designs. These are on mica grounds. This material, powdered, has become a very powerful factor, under skilful manipulation, in producing decorative effects, resembling silk in appearance more nearly than the old satin papers, and being perfectly innocuous and practically imperishable. There are, in addition, two exqui-

site damask patterns, one in Van Eyck red, from the pencil of a lady we have before mentioned, Miss LOUISA AUMONIER, and the other in yellow and coloured flocks on yellow diapered ground, a reproduction of the work of a designer whose name has, unfortunately, not been preserved. It is almost needless to add that art, of no mean order, is visible in all the designs we have named, and Messrs. WOOLLAMS again demonstrate their capability to produce the most exquisite designs and colours of every shade that are perfectly innocuous, and a great number of them reliably washable.

**Pennycook Glazing and Engineering Company.**

Glazing without putty is again illustrated by the PENNYCOOK GLAZING AND ENGINEERING CO., LIMITED, of Glasgow, and 57 Chancery Lane, whose system has been described in the columns of *The Architect* on previous occasions. Generally speaking, it combines the advantages of the lead and zinc modes without their individual defects. Its advantages are comprised in the peculiar section of which the sash bars are formed, giving the maximum amount of strength with the consumption of a minimum quantity of metal, and the addition of a double gutter to each bar, designed to carry off all moisture condensed on the inner surface of the glass. The latter is kept in position by simply folding down a series of narrow flanges of sheet lead rolled in with whatever metal the sash bars are made of, and broken panes can be replaced by any unskilled person with ease and rapidity. The many public bodies, including the Government, who have adopted this system, and who still continue to use it for new works, is the best proof that can be given of its value, and its general application to domestic greenhouses, &c., would be the means of removing a great amount of inconvenience.

**Messrs. F. Rosher & Co.**

Messrs. F. ROSHER & Co., brick and tile merchants and manufacturers, Sittingbourne and Northfleet, Kent, Upper Ground Street, Blackfriars, and of other London wharves, are again well to the fore with a collection of their varied wares. Visitors to last year's exhibition will doubtless remember the elegant structure then erected by this firm, with the object of showing the effective yet inexpensive ornamentation that could be produced with fancy and moulded bricks. Although the exhibit is differently arranged this year, the goods are the same in quality, and the variety is as great as heretofore, their well-known white Suffolk moulded, facing, coping, and arch bricks alone comprising upwards of three hundred designs, all of which are also made in the dark and bright red colours. In roofing tiles Messrs. ROSHER & Co. show some examples particularly worth notice. They are made both plain and fancy, and have the appearance of the ordinary Yorkshire tiles; but the special feature is in their being pressed. This gives them a cleaner surface, and also renders them lighter, yet without reducing the strength. They are holed and nibbed; but the nibs, instead of being thumbled on, are produced in the pressing, thus giving them the utmost solidity, and lessening the chance of their being knocked off. Ridging, finials, &c., of similar durability are made to match, and the price is but a trifle more than the Yorkshires. PHILLIPS'S patent lock-jaw roofing tiles, made under license by Messrs. F. ROSHER & Co., of this same clay, demonstrates the impervious nature of it in the following manner. A wooden frame is hermetically fixed around one side of a tile so as to contain and keep water in contact with it, but which is not absorbed in the smallest degree by it. Any of these goods can be delivered direct from the works at Ipswich by barge in Thames or elsewhere, at about one-third the minimum railway rate. The various felts, including roofing, sarking, ship sheathing, dry hair felts, &c., manufactured by JOHN ROGERS of Belfast, and which are of reputed quality, form another item at this stand, Messrs. ROSHER & Co. being the sole agents, as they also are for GOODDY'S patent flexible jointed sanitary pipes. The special feature of the latter consists of an elastic and impervious collar, fitted in the socket for the purposes of jointing, and, no cement being required, the whole drain is rendered pliable, and less liable to fracture. The goods made at the Rowlands Castle Brick and Tileworks, which have long been known for their uniform colour and exceptional soundness, are now exclusively supplied by Messrs. ROSHER & Co. New plant has recently been laid down and a change taken

place in the proprietorship and management. Samples are on view at Stands No. 202 F and 241 G, respecting which application should be made to Messrs. ROSHER & Co.

**Messrs. R. F. Dale & Co.**

Messrs. R. F. DALE & Co., 1 Bear Lane, Southwark, have again placed their exhibit in the prominent position of Bay 1. From the conspicuousness of this stand it cannot well be overlooked, and it is therefore gratifying to note it occupied by no second-rate firm. But there appears to be a deficiency both as regards assortment and the quantity of goods shown, as compared with their display in former years, and the articles appear to have been taken indiscriminately out of stock with a view more of filling up the allotted space than for the purpose of demonstrating their various merits, which is so far to their credit, as showing their general good finish and quality. The following engraving shows their "European" side-outlet valve closet, which has been described before in our columns. It

appears to possess in combination the individual advantages of "flush-out" and "valve" closets, and though introduced but little more than a twelvemonth ago, it is already in very large demand. Their patent ball-valve recommends itself on account of the simplicity with which it can be put right should the washer in the course of wear-and-tear become leaky. In the event of this happening, it can be readjusted in a few moments. Pumps of various kinds, baths, plumbers' and other brass fittings complete this collection.

**Messrs. W. H. Lindsay & Co.**

Though small in size, the exhibit of Messrs. W. H. LINDSAY & Co., South Wharf, Paddington, and Sandymount Foundry, Llanelly, is perhaps one of the most important, from an engineering point of view, in the building. Before proceeding to discuss this portion of the exhibit, a few words *en passant* as to their patent reversible treads and landings will not be out of place. We are glad to find them increasing in use every year, and wherever they are laid they give entire satisfaction. We are accustomed ourselves to meet with them daily, and can testify to the pleasant sensation experienced in walking over them, while their durability is beyond doubt. Made of very hard wood, in either a small oblong or cube pattern, they nevertheless appear to give an elasticity to the tread which is wanting on plain boards, and, being laid in blocks of a certain size, whenever the one side is sufficiently worn away to render a change necessary, being grooved both sides alike they have only to be turned over to present an entire new surface, or the worn side may even be planed down, or, in the case of stairs, the back ones can be brought to the front of the riser, and those that have performed their duty in that position be placed at the back. For these and other reasons that need not be now entered upon, they undoubtedly form the most pleasant and lasting tread now before us. Turning to the engineering department of this firm, we find some valuable features. Their patent wrought-iron sashes, with bosses of the same material, are so arranged that the latter obscure but the merest minimum of light, and the sashes can be glazed flat, like ordinary wooden ones, without necessitating the chipping of the panes at the corners. But the most important feature, and possessing great interest to engineers, architects, &c., is Mr. LINDSAY'S patent steel troughs or deckings for floors of bridges, &c. These are formed by utilising rolled sections of

splayed channel steel, so that the top table shall be thicker than the sides, in order to approach the theory of the girder principle as much as possible, by which means the metal is taken away from the web and added to the flanges, increasing the sectional strength of the trough and producing a greater moment of resistance over a floor which is composed of an uniform thickness of plate, without increasing the weight of steel to the square foot of area to be covered. By simply rivetting the trade rolled sections together with a single row of rivets, at such a point in them where strain is almost neutral, the cost of manufacture is reduced to a minimum and the requisite amount of strength obtained. Mr. LINDSAY has utilised this application so widely that he makes a section sufficiently light to construct watertight roofs, strong room floors, &c., while they are graduated upwards to others capable of bearing the strain of the heaviest railway trains on bridges or railway floors. Being made of mild steel the weight is considerably reduced, and for the latter-named uses is capable of sustaining an ultimate strain of not less than 30 tons per square inch, with an elongation of 20 per cent. A further collection in this exhibit is a display of hammered ironwork in railings, grilles, panels, &c.; one of the latter, in a frame of wood, forming a portion of an entrance-door, being remarkable for its bold conception and delicate tracery, showing that the art in which QUENTIN MATSYS excelled has worthy followers amongst English workmen of the present day, for we are assured that native talent in this department is exclusively employed by the firm. Messrs. LINDSAY & Co. have just been awarded a first-class certificate and silver medal at the Calcutta Exhibition for their patent decking and improvements in construction of railway bridges.

**Messrs. T. Lawrence & Son.**

MESSRS. T. LAWRENCE & SON, of Bracknell, Berks, again contribute an attractive little erection composed of gauged and carved brickwork and house and wall tiling, which was exhibited here last year. We are told that the building has been placed in a most exposed position since, the object being to prove what the firm particularly claim—that weather has no injurious effect broadly speaking upon the materials manufactured from their clay, which is a rich red. On each side of the erection are two bold carved brick panels or shields, with borders of well-executed foliage, made for some buildings now being erected in Bracknell. As a specimen of what can be done in carving bricks where a good material forms the base, these are certainly very commendable objects. The base of the house is made with hand-made pressed facing bricks, in which the well-known colours of the firm—orange, cherry, red, and rich dark-red—are harmoniously blended, and there is no denying the fact that the bricks made by this firm hold as high a position as any that are made.

**The Papier-Maché Company.**

The display of the PAPIER-MACHÉ COMPANY, Wellington Street, Strand, is of a most artistic character. Largely composed of fibrous plaster, the manufacture of which is generally understood by the profession and trade, we are introduced to a facsimile of a portion of the ceiling made of that material by the firm for the Great Eastern Hotel, Liverpool Street, showing cone, pendants, &c., and the arrangements for ventilating. There is also a specimen of an Elizabethan staircase panel, and pediments for door made for the same building from designs of the architect, CHARLES E. BARRY, Esq. A segment of a large centre-panel for ceiling is shown, so modelled that it can be arranged for ventilating if desired. Another conspicuous feature is a replica of a bold Corinthian capital made for a public building at Cape Town. All these are in pure white, and there are several elegant centre-roses in papier-maché of the same colour. One of the applications for which the fibrous plaster has been brought into requisition, is for mouldings to the panels of saloons in steamships, the advantages obtained being the prevention of damp, and on this point the company have received some gratifying testimonials. In papier-maché the company introduce us to a life-size figure of *Hebe*, weighing only 72 lbs., the finish of which is as clear and sharp as if sculptured in marble. The remaining feature in this artistic collection is a mantelpiece composed of fibrous plaster and papier-maché. This is a good specimen of Queen Anne design, and is coloured in two shades of low-toned greens with gold ornamentation. The extreme lightness of fibrous plaster,

its non-liability to crack, its fireproof qualities, and the fact that ordinary plastering can be dispensed with and the fibrous material screwed on to the joists, render it one of the most inexpensive, and, at the same time, effective materials for decorative purposes we could select.

**Messrs. Clark, Bunnett & Co.**

The exhibit of Messrs. CLARK, BUNNETT & CO., Rathbone Place, Oxford Street, though not presenting any particular novelty, is a fully representative one. The ramifications of this firm are of the most extensive character, for besides branch establishments in several cities in the United Kingdom, they are represented in several European capitals, and in New York, Boston, and Melbourne. The self-coiling revolving shutters of steel, iron, and wood made by them have a world-wide sale, and there is probably no name so extensively seen on these safeguards to our shops and warehouses as "CLARK, BUNNETT & CO." They are shown in several varieties, but need no detailed description. Another speciality with the firm is hoists and lifts, and these, too, are made for every conceivable purpose for which such appliances have become necessary, from the simple hand-power dinner-lift for a private house to that adapted for raising heavy weights in warehouses, and the luxuriously furnished passenger-lift for hotels or mansions. We may note that the whole of their lifts are made with safety gearing, rendering them in use free from danger in case of accident to machinery. The firm also enter extensively into other engineering work, the new Cattle Market at Deptford and the Central Fish Market at Farringdon Street bearing ample testimony to their abilities as constructive engineers. Several specimens of iron and bronze castings are in addition shown as *bric-à-brac* to the collection. A somewhat recent addition to their manufactures is exhibited in the form of the patent Kaio Kapuos smoke-consuming grate, of which they have become proprietors. This grate, it will be remembered, was exhibited at the late Smoke Abatement Exhibition at South Kensington. It underwent some crucial tests both with anthracite and bituminous coal, burning the former freely, and the latter with a very small percentage of smoke. There are few grates mentioned in the official report of the Exhibition to which such high praise is accorded, and it was awarded a silver medal, the highest in its class. Its construction is such that it can be used either as a slow-combustion or quick-draught grate, the change being effected by means of two valves of simple character. When the direct up-draught to the chimney is closed the products of combustion are carried downwards in a serpentine direction to a combustion chamber underneath, which soon becomes highly heated, and here they are mainly consumed, the residue passing up behind the fireclay back of the grate also very hot ere they escape to the chimney. In the cheapest form in which it is made the Kaio Kapuos is a comparatively inexpensive article as compared with some others claiming to be constructed on smoke-consuming principles. Another useful apparatus exhibited is CLARK'S patent self-gripping crab, which by means of very simple mechanism enables the weight to be arrested in its progress at any moment. Numerous specimens of metallic Venetian blinds, of which large quantities are yearly turned out by this firm, form the principle remaining portion of the collection.

**Moule's Patent Earth Closet Company.**

Earth closets are very completely represented by MOULE'S PATENT EARTH CLOSET COMPANY, Garrick Street, Covent Garden, to whom the public are indebted for perfecting and simplifying this system. In all there are six examples of closets and commodes, and three models illustrating their applicability under varying circumstances, besides specimens of the accessories necessary in their use. One of the models depicts the arrangements for an earth closet on the first floor of a house. Immediately under the seat is a receptacle held in suspension by two weights, chains, and pulleys, which, working in a channel prepared for it, can be lowered to be emptied, and then drawn up again to its proper position. This channel or "lift" should be made against the outer wall of the house, and accessible to the garden, so that the attendants need not enter the house; and if the lift is carried to the upper floors, it can be easily adapted to supply the reservoirs with fresh earth for the closets there fixed. A second model shows a closet for the ground floor, or adapted for a garden. By having two small doors in

the wall at the side of the closet, or a larger one in the wall at the back, the supply of earth to the reservoir, and the emptying of the receptacle, may be effected from the outside, and without the closet being entered, thus securing cleanliness and obviating the necessity of the attendant entering the house. A third model illustrates the mode of emptying and refilling with earth from the inside, intended for places where it is not convenient to carry it on from the outside, or where a male attendant is not kept. It also shows how the earth reservoir may be increased in size to enable it to receive sufficient for a much longer period, and so reducing the attention to a minimum. Amongst the apparatus shown, we select two for illustration. The first, No. 4A, has a "pull-up" handle as to a water-closet of the best

construction, and an earthenware rim instead of galvanised iron. The seat is 3 feet long, is made of well-seasoned deal, and is sent out ready for fixing. Our second illustration, No. 5A, is on the self-acting principle. The seat, it will be observed, is slightly raised, and is actuated by a spring connected with the earth receptacle. When in use the seat is pressed down to a level, but on the occupant rising the seat rises also, and opening the valve connected with the receptacle discharges the earth over the faecal matter. This, too, is fitted

with an earthenware rim, is of the same wood as No. 4A, and the makers consider it to be the most perfect form of dry-earth closet yet produced. The commodes exhibited are of the "pull-up" and "self-acting" order, as the "apparatus," are made of different woods, are very compact, and may be used with perfect immunity in a chamber. The accessories shown are the "Broadmoor tank," a strong iron receiver running on wheels, with handle for drawing; a War Office pail, as supplied to the Government, and a sieve for sifting the earth. It is quite unnecessary for us to enter upon the advantages of earth closets. For country or suburban districts, mills, factories, &c., or wherever a supply of earth, or earth and ashes, can be obtained, their advantages are manifold, and the valuable manure they give us very quickly pay for their cost. Considering the expense of fittings connected with water-closets, including the risk of freezing, &c., the expense is much

less, and the steady increase in the sale is a proof of their success. MOULE'S EARTH CLOSET COMPANY have certainly been the pioneers in this industry, and the apparatus they send out are of the most reliable kind.

#### Messrs. Chambers, Monnery & Co.

MESSRS. CHAMBERS, MONNERY & CO., 41 Bishopsgate Street Without, E.C., are again well to the fore with a good general assortment of builders' ironmongery, including some elegant suites of fancy wood and polished brass furniture for inside and front doors, patent and other casement and sash-fasteners, &c. Despite the very ordinary appearance a collection of this kind must of necessity present, the intent observer will not pass this stand without his attention having been arrested by at least two quite distinct classes of goods. We refer to wall-ties and kitchen-ranges. The annexed cuts depict two new designs

of the former articles, which are known as MONNERY'S Patent, and will tend to make the name of this firm and wall-ties more and more synonymous terms. As the engravings show, they are made with and without turn-down points; but the special feature consists in the serrated or jagged surfaces and the centre studs or bosses, which a glance will show no amount of pressure or strain will disturb, and they should in future, where their use is necessary, be the only ones specified. In ranges their "Kitchenette," of which we also append a sketch, is a

leading feature. Though but 30 inches, it possesses a capacious oven, and the flues are arranged in the most approved manner, so as to utilise all the heat. It is also self-acting and requires comparatively no setting, and, with its wrought bars, brick back, and great strength, may be called a "Leamington" in miniature.

#### Messrs. Butters Brothers.

An interesting assortment of builders' machinery is shown by Messrs. BUTTERS BROTHERS, of Hope Street, Glasgow. The leading item in the exhibit is a contractors' hand-derrick crane on a new principle. As we purpose presenting our readers at no distant date with a fully illustrated and detailed description of this article, we shall on the present occasion merely observe that its arrangements to dispense with the lapping or coiling of chain in lifting the load and in lowering the motion wheels do not revolve, that is to say, they are put out of gear by a lever, which also, with the assistance of a clutch, controls the lowering; friction is thus obviated and wear and tear of motion wheels prevented. A new concrete mixer, capable of massing 80 to 100 cubic yards per day of ten hours is another conspicuous feature, and there are navy barrows with steel wheels and axles—again reducing friction and labour—and tipping boxes with false bottoms. From a contractor's standpoint, this is one of the most unique exhibits in the Hall.

#### Messrs. Esdaille & Co.

Amongst the display of joinery, that of Messrs. ESDAILE & CO., Wenlock Basin, City Road, as usual, calls for remark. Amongst the collection are doors of American and Swedish make, Swedish mouldings, and the cheap trellis-work that at this season of the year in particular is to be found in all directions. English and American Venetian-blind laths are to be seen side by side, as well as

hand and machine-made plasterers' laths, &c. Some attractive ornamental sash-frames are also exhibited. The question of cost as regards foreign joinery has been so often adverted to as to leave little room for further remark, and we can only again call the attention to the English to the "moral" these importations point to. A section of this exhibit is devoted to ships' blocks, of which the firm are extensive makers by steam machinery. They comprise nearly every kind required by the mariner, and are excellent specimens of workmanship.

#### The Austin Disinfecter Company.

THE AUSTIN DISINFECTOR COMPANY, of the Wool Exchange and West India Dock Road, exhibit their system of automatic flushing for closets, urinals, drains, &c., by the assistance of antiseptic or disinfectant. The syphon is constructed to receive a small box upon its top and in connection with it, containing a disinfectant or antiseptic. This may be either in the form of a liquid or soluble crystal, a row of small holes in the lower part of the reservoir bringing the water into contact with it, and in discharging until the water passes the holes in question, a certain quantity is drawn out and mixes with the clear water. The syphon can, of course, be arranged to flush at periodic times, according to circumstances, and a constant flow of a disinfectant into closets or drains is bound to have a purifying effect and to render such places inodorous or innocuous. An even more simple and inexpensive mode of securing the same results is obtained by inserting a small vessel made of a porous clay into the supply cistern, and which we illustrate. This porous

disinfecter, which is supplied at the small sum of 6s. 6d., is filled with crystals of a soluble disinfectant. The water penetrating the clay dissolves the crystals, which, in turn, permeate the water in the supply cistern, and so give us a flush of disinfectant every time it is discharged. It is said that one of these clay vessels, filled with the chemical, will operate unimpaired upon the water for six months, and the advantages thus offered, if universally carried out, must, of necessity, effect improvement in the sanitary features of our houses, &c.

#### Messrs. Rendle Bros.

MESSRS. RENDLE BROS., 3 Westminster Chambers, Victoria Street, Westminster, still maintain the reputation they have attained for their "Electric" paint remover. This remarkable preparation, which we have often described before, does not appear as if it were going to be superseded; indeed, we doubt if it is possible to find any other substance so quick and ready in action. The effect with which it removes old paint or varnish, however hard, is such that the day cannot be far hence when hot irons, charcoal fires, scrapers, &c., with their attendant nuisances, must give place exclusively to this admirable and simple preparation.

#### The Indestructible Paint Company.

THE INDESTRUCTIBLE PAINT COMPANY, Cannon Street, E.C., make their usual interesting display of their indestructible and enamel paints and BROWNING'S patent invisible preservative solution. Of the latter it is impossible to say more than we already have in our columns, and the fact that at the late Fisheries Exhibition it was awarded a special diploma of merit shows that it is still unrivalled. We are told that the authorities of the British Museum, and Science and Art Department, South Kensington, have largely used it for coating fossils and geological specimens with the most satisfactory results.

**Messrs. Meakin & Co.**

Messrs. MEAKIN & Co., Baker Street, W., are present with their patent sash-fastener and opener. This appliance, which has stood the test of several years, and is now very well known, is fitted to a full-size model of a heavy plate-glass window, so as to readily demonstrate its practical qualities. Amongst the advantages it possesses are that it provides a perfectly convenient means of opening and closing the largest plate-glass windows for ventilation, and secures both sashes when closed. The use of long-arms and the ordinary sash-fastener are entirely dispensed with, and offers a more effective resistance to burglars. Their patent "oilaible sash-pulleys" are also worthy of note. They are particularly adapted for heavy sashes, as the axles can be lubricated without any trouble, and their durability and freedom of movement is thereby much increased.

**Messrs. Smith & Stevens.**

Messrs. SMITH & STEVENS, 48 Leicester Square, and Queen's Road, Battersea, are no mean competitors in the hoist and lift industry, and show three or four varieties possessing noteworthy features. Prominent amongst them is their "self-sustaining" lift for hand-power, which we drew attention to last year, but which has since been somewhat improved upon. In its original form friction wheels were arranged to act upon the suspending rope of the lift, that no matter what weight might suddenly be introduced in the cage it would not move without the aid of the endless hand-rope. In the course of time, from wear and tear, &c., these friction wheels were found liable to lose some of their power, and this has now been rectified by

the substitution of iron dogs in the gearing, which create a firmer grip, and ensure at all times the regular action of this automatic break. RUSSELL's patent "Wonderful" self-feeding open fire-grate, GILMORE & CLARKE's patent self-regulating ventilator, and a good general assortment of builders' ironmongery completes this exhibit.

**The Bracknell Pottery Brick and Tile Co.**

The BRACKNELL POTTERY, BRICK AND TILE CO., Bracknell, Berks, and Nine Elms, S.W., again send a very useful collection. The exhibit comprises a variety of designs of superior ornamental and moulded bricks, hand and machine-made red facing bricks, rubbers, &c. But this firm make a leading feature of tiles, and they have put up a structure to show these, and also the working of external and internal angles, sprockets, tips, and valleys, &c., the finish, and clean, and true appearance of which leaves little to be desired. Less cannot be said of the ridges, finials, &c., which are also of excellent design; and the various other samples shown, comprising garden tiles, agricultural pipes, paving squares, and glazed encaustic tiles, are equally meritorious.

**Messrs. J. J. Greenwood.**

Messrs. J. J. GREENWOOD, of Carlyle Works, Lot's Road, Chelsea, S.W., exhibit a good assortment of slate slabs, cisterns, urinals, Williams's and other ridges, and every kind of slate-work; Staffordshire blue bricks, ridge-tiles, garden edging, drain-pipes, and chimney-pots. Mr. GREENWOOD also has a good show of marble chimney-pieces, fenders, dairy shelves, lavatory tops, and every description of marble.

INTERNATIONAL  
SMOKE ABATEMENT EXHIBITION,  
MANCHESTER, 1882.

THE Advantages of this Grate over all others are, its simplicity of construction, its small consumption of fuel, its great radiating heating properties. Can be adapted to any existing grate fronts, and if required, can be arranged to introduce fresh air from the external atmosphere at any required temperature, thus securing ventilation with warmth.

The Grate can be seen in Action at the Show-rooms,  
**6 CHARING CROSS** (corner of Northumberland Avenue), **LONDON.**

Also a good selection of REGISTER GRATES, MANTEL REGISTERS and FINE CAST MANTELPieces and OVERMANTELS  
Price Lists on Application.

BUILDING EXHIBITION AGRICULTURAL HALL.

**WEBB'S WORCESTER TILERIES COMPANY, LIMITED, WORCESTER.**

"Thoroughly well baked, hard as silicate, and utterly damp-proof, in shape they are perfect, fitting one into the other with the precision of a Whitworth gauge, whilst in colours no tile in the market can surpass them. This applies to the Geometrical Tiles. The Webb Encaustic Tiles, with new floral designs for hearths, jambs, mantel cheeks, and pilasters, are the choicest in colour and the best contrasted in tones of any we have seen for a long while. These Encaustic Tiles are designed by a true artist, who combines a strong sense of colour, never even in the boldest pattern lapsing into garishness, with an untiring play of fancy."—*Architect.*

"The arrangement of the Pattern Book and Sheet is neat and artistic, calculated to afford to purchasers a comprehensive means of selection in the choice of designs, many of which are novel and good. The tiles are excellent both in quality and colour."—*Building News.*

"They are of great excellence in design. . . . The clay is hard, and evidently sound; the opposite of porous. The material is not surpassed by any found in this kingdom. As we have intimated, there is a wide choice of designs, and these are obviously the productions of a true artist in the style, who has given long thought and study to achieve the right and avoid the wrong."—*Art Journal.*

**PATENT WROUGHT-IRON SASHES WITH WROUGHT BOSSES**

SPECIALLY ADAPTED FOR WAREHOUSES, SCHOOLS, AND PUBLIC BUILDINGS.

CABLE LIGHT

The Patentee begs to call particular attention to the great strength of this construction. The Bars and Bosses, being of malleable wrought iron, form an exceedingly firm joint at the intersection of bars. They are durable, and of light appearance, the Bosses being small and not unsightly. They can be made at very short notice, and at the price of an ordinary cast iron sash.

PRICES UPON APPLICATION.

CABLE LIGHT.

CLOSE BAR SASH (obviating use of Window Guards)

ORDINARY WAREHOUSE AND SCHOOL SASHES.

VENTILATOR

Back view of Boss, full size.

Section through Boss, full size.

These can be glazed flat, like ordinary wooden sashes, without the corners of the panes being chipped off.

Front view of Boss, full size. Obscuring no appreciable light.

# The Architect.

## STONE, BRICK, AND PLASTER AT THE BUILDING TRADES EXHIBITION.

THE institution of an annual exhibition of the productions of inventors and manufacturers in connection with the great "industry" of building is one which in these enterprising days seems obviously to involve the promise of no inconsiderable benefit. So many, indeed, and so various, are the contrivances that crop up every year in England, in this more than most other branches of trade, that the more ordinary resources of public advertisement frequently fail to attract attention even to the best of them, and nothing short of

a "concours" of this kind can therefore be effectual. The great difficulty appears at first sight to be how to procure the attendance of the public, if merely those sections of the public more closely concerned. This difficulty can only be met in one way. The promoters must be content with the best attendance they can get of those who represent, if not the actual "consumers" or persons for whom houses are built, the agents of those consumers, or those who build the houses for them. Amongst these, professional architects necessarily take a leading place; and it is especially a matter of interest for them to consider year by year what progress is being manifested. We propose, therefore, on this occasion to take up a few of the questions involved in building progress, and inquire in what direction, and with what effect, the development of improvement seems to be made apparent. These points necessarily must be few, and our observations must be brief; we will also ask to be excused for not quoting names.

Artificial stone, concrete, brickwork, and terra-cotta may fairly claim the first notice. It may look like a paradox, but it is not so, when it is suggested that Nature does not undertake to provide man with materials for building. In other words, in primitive construction we make what use we can of what substances come most readily to hand; in construction more mature, we confine ourselves to the most suitable, and refine upon our processes of adaptation; but in advanced scientific design, as an altogether artificial enterprise, we are bound to consider—iron, for instance, is a notable case in point, and steel still more so—that our ingenuity in contrivance ought to be exercised quite as much, if not a great deal more, upon the artificial perfection of the material as upon the artificial application of it. Hence it is that in our age, as especially the age of invention, mere stone dug from the quarry, mere brick moulded from the clay, and even mere timber cut from the forest, have ceased to impose upon us the trammels of their accidental structure, and we are boldly searching around for such equivalents as shall be, by reason of invention rather than discovery, superior to these crude because fortuitous productions.

In the exhibition before us artificial stone occupies a prominent place, especially if we include concrete in the name. We ought also the more readily to be allowed to do this because it is in the direction of lime concretes that the development of artificial stone is now actually taking place. The more purely chemical contrivance whereby sand and silicate were so ingeniously brought into the form of a silicious sandstone does not appear to be at present engaging specific attention, except that silicate of soda is introduced as an accessory, to aid, if it really does so, the more direct induration of a calcareous hydrate. But several processes are being earnestly pursued which we may describe in common language as the production of a strong mortar of lime or cement and a granular substance, for conversion by one or another form of pressure into a block of stone; and no one can help perceiving that very remarkable success attends several of these efforts. In one case it is the boast of the manufacturer that he accomplishes by such means so perfect an "imitation" of the texture and tint of several well-known natural stones as to deceive the experienced eye; and no doubt he is entitled to add that both in mechanical strength and in chemical durability the artificial material is superior to

the crude natural substance imitated. But here we venture to think the element of imitation is a fault rather than a merit. The proper texture for an artificial stone is simply the texture which arises out of its proper manufacture, and the proper tint is in like manner the tint which comes of its own accord, modified, if at all, by fair means, for some proper purpose, such as pleasing colour for its own sake. Let us understand, however, that the development of artificial stone is now proceeding, not upon any new line, but upon the old basis of mixing together a calcareous cement, a silicious or metallic sand, and water. This may appear to be scientifically a sort of retrograde movement, but nevertheless it may perhaps be practically the only direction in which to attain the object dictated by circumstances. It must be left, however, to inventors to argue out the principle for themselves.

Terra-cotta does not appear to be engaging so much attention as might be expected; that is to say, theorists and artists are claiming for it more consideration than manufacturers are bestowing upon it. This is probably to be regretted. The South Kensington type of terra-cotta, or the true old Italian—that which accepts the block without sophistication as it comes from the kiln—is surely well worthy of all the development it can receive; that in which, on the other hand, blocks are more or less faced or touched up before use is perhaps scarcely worthy of praise on principle. But, at any rate, we may suggest that terra-cotta "ornaments" are scarcely so worthy of critical approval; the proper service of the material, at its best, is for an entire facing, or at the least for a very liberal arrangement of dressings on a facing of brick of high quality. The mere ornamentation of terra-cotta is the easy part of the problem; the more difficult considerations are the colour, the durability, the regularity of simple shape, and of course the price.

This brings us naturally to speak of brick, and it must be acknowledged that the exhibits of brickwork are more satisfactory in a certain sense. Indeed they are what may be called too satisfactory. The best specimen is simply a piece of rich architectural design, with elaborate carving executed on the substance of the brick with the usual tools of the stone carver, the white jointing coming wherever it may. This surely cannot be approved by the architectural critic. It is brick, no doubt; and it is work done in or upon brick; but it is not brickwork. It is stone carving done in a material which is not meant for stone carving, or for any carving. If terra-cotta, artistically considered, ought to have the surface of kiln-burning left untouched, much more ought the ornamental character of brickwork to be produced by means of bricks wholly unsophisticated. Compare, for instance, the Elizabethan chimney shafts with the modern Queen Anne pilasters and pediments—to say nothing of swags of fruit—and the rationale of the matter is clear. Moreover, what is the substantial value of a brick after its surface has been chiselled and carved away and even undercut? Another sample of ornamental brickwork in the exhibition is as crude and coarse as the one just referred to is, in its way, elegant and refined. Perhaps it is more honest brickwork, but so much the worse for the pretensions of brickwork when they get on a wrong line. Ornamental brickwork may perhaps be at once described as a style of work which in the nature of the thing can never be of the rich Renaissance style at any rate.

Glazed bricks seem to be progressing a little; but it seems doubtful whether they can ever be successful in practice in the way which theory points out so confidently. To put a glaze upon good bricks is easy enough; and the fact that the glaze keeps itself clean—with a little attention—is easily understood; but there is something in the glazed surface as a whole which always looks out of place; and yet one can scarcely tell why. Is it because the element of glazing demands æsthetically a special treatment in respect of forms—something, perhaps, of the same order as highly subdivided mediæval work, with a special avoidance of all breadth of reflecting surface?

In plaster work, papier-maché, and the like, something but not much is being done. Structurally the fireproof plaster slabs cannot but be interesting. The use of slag wool is also a contrivance which may probably have a future before it in the way of fireproof stuffing or underlaid covering; but most of us would perhaps prefer to trust to it in some more artificial form. Fibrous slab—made of canvas and paste, we believe—as a more rough material, and papier-maché as a finer one, may often do good service. But why should either of them be used to cover and conceal iron ribs and convert them in

appearance into impossible stone beams? In the new glazed roof of the Royal Exchange, for instance, where so excellent an opportunity is afforded for legitimate ironwork, it is only paper soffits that we shall see after all! Surely this is a pity.

Sgraffito work, or the "scratching" away of an outer coat of plaster in one colour to expose an under coat of another colour, is a form of art which, one would think, in some of the rough-and-ready picturesque architecture of our day, ought to be cultivated. It is represented in the exhibition, but not to much purpose; may we recommend it to the attention of experts?

## INDUSTRIAL ART EXHIBITION AND COMPETITIONS, BRUSSELS.

BY A CORRESPONDENT.

NOT long ago we described an interesting architectural exhibition held in the handsome Palais des Beaux-Arts, Brussels. This has now been superseded by a manifestation, also of an artistic and archæological nature, though of a different branch of industrial art. The present exhibition has been organised by the Technical Instruction Section of the Brussels Union Syndicale, as the complement of a series of competitions in furtherance of the cause of technical education. This, the first of a series of periodical competitions and special exhibitions, was originally limited to designs of lace and fans, to which were subsequently added the allied industries of embroidery and artificial flowers. Under the patronage of the Count and Countess of FLANDERS, the presidency of M. CH. BULS (Burgomaster of Brussels), and the vice-presidency of M. DANSAERT, President of the Union Syndicale of Brussels, a loan collection of works of ancient textile art has been got together that afford almost as much interest to the archæologist as to the expert.

From the introduction, by Canon REUSENS, to the section of embroidery, we find that the invention of this art was attributed by the Romans, who largely employed it, to the Phrygians; the term *orfroi*, which was used in the Middle Ages for embroidery executed partly or entirely with gold threads, being a corruption of *aurum Phrygiæ*. We learn also that, from the commencement of the thirteenth century, the art of embroidery, justly called *acupictura*, or "needle painting," attained great perfection, became still further developed during the fourteenth, and began to decline from the commencement of the fifteenth century. At this epoch, three countries especially distinguished themselves, viz., Belgium, Burgundy, and the Rhine Province. The two principal centres for the production of embroidered fabrics were Cologne and Arras, which latter name has been adopted both in our own language and that of Italy as the term for the fabric made there.

Among the embroidered works previous to the fifteenth century (of which a piece typical of each period from the tenth century has been selected), besides a rectangular band of Oriental origin, of apparently earlier date than the eleventh century, there is a chain-stitch embroidery in different coloured silk on fine linen, with two scenes, one probably representing the Flight into Egypt, that was worked in the tenth or eleventh century. There is an interesting collection of *aumônnières*, or *escarcelles*, of both the thirteenth and fourteenth centuries, and also a cope, illustrating the martyrdom of the Apostles, dating from the beginning of the fourteenth century, and in an excellent state of preservation. An altar frontal from the Church of St. Martin, Liège, is of red velvet, ornamented with (1) four vertical *orfroi* bands of the sixteenth century, (2) two circular medallions of the same epoch, and (3) a band of embroidered *orfroi* of the fourteenth century, with an addition, made in the sixteenth century, of two rectangular portions.

Among the church vestments a chasuble from the church of St. Nicholas, Namur, with the inscription, "Mgr. JOHANNES DE RAMONT me fecit fieri. Orate pro eo. Anno Domini M.CCCCC," produces great effect with apparently insignificant means. Another chasuble, from the church of St. Charles Borromeo, Antwerp, is exceedingly interesting, because the medallions are believed to have been embroidered by the hands of HELEN FOURMENT, RUBENS' second wife, after the works of the great master. One of the gems of the collection, and in which the ground does not kill the work, is the cope

called that of St. LIEVIN (Abbot of St. Bayon, Ghent), of gold brocade, with embroidery after the cartoons of GÉRARD HORENBOUT. A cope of the seventeenth century in black velvet, embroidered with circular medallions, from Notre Dame, Tongres, is interesting because it has silver clasps of the fifteenth century. Another in red velvet from the same church, of about the year 1700, has silver clasps of the beginning of the sixteenth century. In a dalmatic, in red velvet, of the sixteenth century, lent by M. GUST. VERMEERSCH, the faces of the Virgin and Child and various saints, embroidered in medallions, are so remarkably well executed that they look like miniature paintings.

Another gem (although it was purchased not many years ago for 30*l.*) is an altar frontal, in *orfroi*, of about the year 1620, representing the Last Supper, and also the four other meals at which our SAVIOUR is recorded to have been present. A frontal (lent by M. SOMZÉE) embroidered in gold and coloured silk on white silk ground, is remarkable for the fact that musical notes are introduced into the composition.

Among the embroidered pictures is an oval medallion in coloured silk representing CHARLES I. of England; a landscape, embroidered in coloured silk, dates from the seventeenth century. Very interesting are the escutcheons and flags of the old guilds, and the collection includes one of the only nine tabards, or herald's coats-of-arms, that are known to be in existence, of which there are four at Vienna and the remaining four at Madrid. In one of the many richly-embroidered coats of the LOUIS XVI. period, some feathers embroidered in coloured silk appear as if they were real and merely laid on. The Brussels municipal authorities have lent the costumes of the famous statuette called *Manneke-Pis*, which were made by order of LOUIS XV. after the Battle of Fontenoy (1745). The French having carried off "the oldest citizen of Brussels," the people rose in consequence, when the King of France caused the statuette to be restored, and invested it with the cross of St. LOUIS. Some coverlets (*couvre-lits*) of the fifteenth and sixteenth centuries are exhibited, and also a large *marquoir*, or sampler, of the seventeenth century. M. GUST. VERMEERSCH has contributed a throne in red damask of GEORGE III. of England, with the initials "G. R." At that period it was customary for ambassadors to have thrones ready to receive their sovereigns in the event of a visit.

Canon REUSENS has also contributed some notes on lace, from which it appears that this work may be divided into four principal classes: (1) *laci*, consisting in a network of square or lozenge meshes, on which the design is embroidered; (2) work produced by withdrawing threads; (3) point or application; and (4) pillow lace. If the derivation of our generic term for the productions of this art is evident, that of the French *dentelle* is no less so, the borders being frequently *dentelè*, or indented. In most specimens of lace there are two distinct parts, the field and the ornaments, which are technically denominated "flowers," whether they be really so or not; but in some kinds of lace, notably those of Venice and Spain, there is no ground, the "flowers" being connected by irregular attachments. The word *guipure* would appear to have a very wide and indefinite signification. Originally, *guipure* was made of a small strip of parchment, covered with silk or gold or silver thread, producing ornaments in relief; then the silk rolled round the parchment or a thick thread was called *guipure*; and latterly this term has been used for lace of linen threads, with *flowers* of a vague and undecided pattern.

North Italy and Belgium dispute the honour of originating the lace industry, and both appear to have good ground for their claims. At any rate, Belgium produced a great deal of pillow lace from the beginning of the fifteenth century, without flowers or ornaments, which served for a long time as the field or foundation of Brussels point; while, a little later, at the beginning of the sixteenth century, Belgium also excelled in *laci*, as proved by the lace cap worn by CHARLES QUINT under his crown, and still preserved in the Cluny Museum at Paris. On the other side, Venice originated, or at any rate introduced, the point lace or application, in which flowers in relief were produced by the needle. The difference between Venice and Genoa lace is that the flowers of the latter are in rather lower relief. At Venice also were published the first books containing patterns of lace. It is sad to think that Mechlin lace, the "queen of the laces," as it is called by English poets of the seventeenth century, which was made entirely with bobbins (*fuseaux*) should now be almost extinct.

Among the five hundred and seventy-three specimens of lace exhibited, that which first claims notice is a superb alb in Venice lace, decorated with allegorical figures in the manner of BÉRIN. In some Brabant *guipure* the design is very marked. A Flemish tablecloth of the sixteenth century, 1·68 by 1·3 mètre, lent by Mdlle. LÉONIE T'SERSTEVENS, is formed of squares worked by bobbins and united in chess-board fashion, the subjects being alternately historical and simply decorative. Besides several specimens of gold and silver lace, there are a dozen painted portraits, taken from various collections, to show the manner in which lace was worn at the different periods. One room is entirely devoted to the extensive and well-known collection of Madame MONTEFIORE LEVI, which includes an ancient *nanduli*, or veil, brought from Paraguay, and an ancient Persian sampler. There are also some unique examples of the lace that was formerly made at Binche, in Belgium, and distinguished by its *mate* ground.

In a lively introduction to the section of fans, M. GUST. VERMEERSCH reminds us that the fan, in semicircular form, appears on the frescoes and bas-reliefs of Assyrian and Egyptian monuments; and that, in the "Orestes" of EURIPIDES, a Phrygian slave recounts that he has, with soft freshness, slightly raised the hair of the sleeping HELEN by means of a fan of feathers. Fans made of feathers are frequently represented on Grecian and Etruscan vases; while the *tabellæ* mentioned by OVID and PROPERTIUS consisted of thin slips of wood strung together as at the present day. The use of the fan, chiefly as a means for driving away flies, entered generally into the domestic life of the eleventh and twelfth centuries, when ostrich, peacock, and raven's feathers were mounted on golden or ivory handles, frequently enriched with precious stones. An inventory of the personal effects of CHARLES V. of France (1380), includes a round folding *esmouchoir* in ivory with an ebony handle, and ornamented with the arms of France and Navarre. At the time of HENRI III. of France, whose *esventail* is minutely described by PIERRE DE L'ÉSTOILE, three forms of fan were in use: those of feathers, small flags of Moorish origin imported from Italy, and folded fans like those of the present day. In the seventeenth century they were made of leather, taffetas, and paper; while pearl mountings, delicately wrought with open work, first made their appearance. In the eighteenth century the fan assumed its present aspect; and great artists, including BOUCHER and WATTEAU, did not disdain to adorn them with their paintings. In the eighteenth century another kind of fan was much in vogue; it was entirely composed of very thin sheets of ivory, ornamented in the lower portion with Chinese subjects on gold ground, and in the upper with mythological or historical compositions after the manner of LEBRUN. These fans are distinguished by being coated with the very fine varnish which was invented by the carriage-painter MARTIN, at the beginning of the reign of LOUIS XV., and the secret of which is now lost.

The collection contains two remarkable specimens of this last-named style. One, lent by Madame SOMZÉE, with ivory mounting, represents the deliverance of ANDROMEDA, with a pastoral subject after WATTEAU on the reverse. The other, lent by Madame LAMBERT DE ROTHSCHILD, dating from the middle of the eighteenth century, is ornamented with two subjects, also after WATTEAU—angling, and a village dance. The Viscountess MOERMAN D'HARLEBEKE contributes a fan of the LOUIS XV. period, mounted with pearl and gold, and the parchment exquisitely painted—it might be by BOUCHER—with a subject illustrating the hymeneal altar. To mention one more of the two hundred and seventy ancient fans exhibited, No. 1,039, lent by the Countess DE LALAING, is a historical fan, representing a kissing of hands at the court of PHILIP V. of Spain, and includes thirty-six figures. On the reverse is a sea piece. The mount is of tortoiseshell, inlaid with figures in chased gold and silver.

Turning now to the modern section, which is numerically, as well as from an artistic point of view, far inferior to the ancient, we find several architects, including M. BORDIAU and M. BAES, on the executive committee. There are fifteen exhibitors of lace and twelve of embroidery, while the Brussels and the Antwerp technical schools for girls, the respective directresses of which are Mdlle. MARCELIS and Mdlle. VAN DE WAELE, contribute designs for lace and embroidery executed by the pupils. Mdlle. MARGUERITE DIELMAN, of Brussels, sends designs for a lace parasol, flounce, handkerchief and lappet in "point application." M. L. D. V.

PIOT contributes twelve sheets (out of 125) of drawings of "fantastic flowers," suitable for embroidery and trimmings; and M. E. F. SORÉ, designs of cyphers, arms, &c., for embroidery or other decoration. There are seventeen exhibitors of modern fans, including the two technical schools for girls at Brussels, and that at Mons, of which latter Mdlle. DELBOUILLE is directress. The fourteen exhibitors of artificial flowers include the Antwerp technical school for girls, the pupils of which contribute collections of the various parts, arranged on cards, of several artificial flowers in their successive stages of manufacture, thus illustrating the whole process. To conclude the modern section, there are seven exhibitors of trimmings and four of buttons, the best of which latter are copied from ancient models.

We now come to the special competitions, of which there are two series, one for lace and the other for fans. And here it will be well to notice the ingenious method adopted by the managing committee to prevent the identity of the competitors from being disclosed by the symbol or motto chosen. At the time fixed for the reception of the competing works, each competitor had to obtain from the committee a special envelope, stamped and numbered, to contain his name and address, and also a numbered ticket, about 3 inches by 1½ inches, gummed at the edges, and perforated after the manner of an Oxford frame, for covering over the symbol or motto on the designs, &c., so that the jury had only numbers identified with the works they were called upon to judge. Only one jury was appointed for the three competitions of lace designs, but one each for the three fan competitions. Each jury consisted of only three members, one named by the committee, and the other two by the competitors, by means of voting papers. Several architects were chosen to serve on the juries; and MM. E. HENDRICKX and JANLET, architects, were charged with the arrangement of the works entered for competition.

The first prize (each 300 frs. = 12*l.*) for the three lace designs were carried off, one by M. A. DE SPIEGHELER, and the other two by M. H. VAN CUTSEM, all of Brussels. In the fourth competition, a painted fan, with design for mounting, the first prize (1,000 frs. = 40*l.*) was awarded to M. A. L. DE MOL, and the second (500 frs. = 20*l.*) to M. S. A. LANNEAU. In the fifth competition, a lace fan executed, the first prize (300 frs. = 12*l.*) was awarded "with the greatest distinction" to M. L. SACRÉ; and another (extra) for the mounting, to M. ROYER DE FRAENE. In the sixth competition, "a fan in any style executed," the first prize, of the same value, was awarded to a fan bearing the No. 45, and the motto "A vaincre sans péril, on triomphe sans gloire." It is painted by M. ROYER DE FRAENE, and mounted in tortoiseshell, enriched with precious stones, by MM. BAUTMANS and HOOSEMANS. The competitions and the exhibition generally have caused considerable interest, and have attracted a large number of visitors. The secretary of the work is M. PAUL DAVREUX, formerly engineer and lecturer at the Musée de l'Industrie, and now assistant inspector of technical instruction.

#### SELECTED PICTURES.

IN the galleries of Messrs. WALLIS in Pall Mall and Messrs. MACLEAN in the Haymarket are on view one or two pictures of exceptional interest from foreign ateliers—pictures which, having raised a strife of adulatory or adverse criticism on the Continent, now meet the test of a London audience. In the French gallery of Mr. WALLIS, which should, by the way, be renamed, inasmuch as it is now far more the home of German than of Parisian art, we find in the upper room a picture by Herr LEIBL, of Munich, entitled *In Church*, which last summer created an absolute *furor* of criticism and excitement among the not easily roused people of the Bavarian capital. The subject shows three women of the peasant class seated or kneeling all a-row at their devotions in an open pew at church. They pass in age from youth through worn maturity, wrinkled before due time, to old age; they are all ill-favoured, stolid, ungainly, but clean, dressed in Sunday-best attire, which is ugly, but neat. The artist has been at no pains to soften or select his types for beauty or attractive expression, neither has he chosen to bring their attire into charm of fine or even picturesque colour. The girls' blue and black plaid gown and frightful high hat with twisted gold cord, and stiff

kerchief gaily flowered, serve only to emphasise the angles of her form, and suitably to accompany the huge hands which surely the painter has unnecessarily distorted in pose. The oldest woman, poring over her breviary, and the stern-faced companion beyond, whose profile stands out against the white wall, wear the twisted kerchief over the head, which is the coil of the poor Bavarian peasant woman, and their rough gowns are dark and decent. On this triad of unbeautiful women, with all accessories, Herr LEIBL has bestowed a perfection of solid, elaborate, and close technique, which recalls the manner of the VAN EYCKS. With dry distinctness he has realised the detail, with well-considered scheme he presents the large features of his subject; all is kept in excellent order and relation. There is no doubt about the strength of the artist's effort, or of his reticence. The force and vivid actuality of the picture thus rendered, joined to the familiarity of the types, must presumably account for the great repute which it won when, after four years' labour, shown to the public. To us the picture is a melancholy one. Although there does not cling about it the sordid or brutal associations which the school of homely realism in France forces upon one, yet it certainly does lack the dignity of expression and suggestion which belongs to the higher capacities of the subject. It lacks the appeal of noble colour or of gracious line, and our admiration for the masterful and laborious technical qualities is wrung from us as half-hearted tribute to a painter who foregoes the high privileges which his gift of skill, interpretative and mechanical, places within his grasp, and gives us cold prose instead of fervent poetry, death instead of life.

In the gallery of Messrs. MACLEAN hangs one of those marvellous pages from the annals of the poor, which only M. BASTEIN LEPAGE can thus adequately present from the point of view which he and his *confrères* assume. What that point is we have before now indicated. M. LEPAGE is not cold, impassive, and photographic, like the Bavarian painter on whose work we have been dwelling; he is in earnest about a meaning as well as an object. Philosophically he preaches the doctrine, or so his disciples affirm, that the typical peasant is dirty, sordid, repulsive in habit, without joy or hope, sunk to the lowest ends of animal life, suffering silently, sullenly resigned or doggedly restive; and thus he must be represented, perpetuated on canvas by enduring pictorial record, as a protest against the systems that have made him thus, and the failure of human effort to redeem him, or of Divine pity to rescue him. So here we have a *Rustic Courtship*: on either side of paling that divides neighbours' gardens, a young fellow—mechanic, perhaps, from his ragged apron—and a girl of the people lean to do their wooing—not face to face as in courtship polite, but back to back. There is a touch of the tender prettiness almost inseparable from youth in her averted head and throat above the cotton frock, and she holds a rose in her hand; the low-browed, loutish lover, perhaps at a loss for words, picks his nails—of which process, as of cleaning generally, he stands in much need—while his face expresses a most unjoyful mental state. With detail and mastery are painted the tangle of flowers, the outbuildings, the plots of garden-ground that slope up to the village roofs above on the brow of the hill, and the spire of the church that stands on the farther side. There is plenty of suggestion here of the round of life within the hamlet, and the landscape is put in with even a curious power over the multitudinous accidents of a hillside of vegetable plots and stunted trees. Nevertheless, so joyless is this wooing, so ungainly and begrimed, hard-featured and repulsive the actor most in view, that it were indeed a punishment to be condemned to live with this picture, and daily to peruse such pictorial one-sided diatribe on the sordid lives of the lowly, to whom not even May-time and young love can bring beauty or hope. Here, again, though in different manner from Herr LEIBL, the French painter is false to his vocation, for the office of the artist is not to depict a half-truth, for the purpose of doing which he must as far as possible eliminate the beautiful, exaggerate and dote upon the low and ugly; this is not fidelity to nature, but cynical human contempt, using the painter's brush to close our eyes, not to open them.

Leaving, with only a word of admiration for the delightful work—*The Head of a Girl*—by Signor TITO CONTI, the well-chosen collection in the Haymarket, we return to the French Gallery to note a picture that has given us supreme pleasure by its genuine artistic qualities. This is *A Portrait* by Herr F. A. KAULBACH of a lady, full length, on nearly life scale.

The girlish figure is easily draped in a black silk walking-dress, with gold Marguerite girdle. She holds a blue-and-grey shawl and her parasol against her side with one hand; the other is laid caressingly on the neck of a big hound, whose grey coat brings out the noble lines of his form against her black dress. A swirl of dark green curtain, some rose sprays dimly seen in shadow, break the background low tints. The tone of the whole is dark and quiet, forcing into fresher brilliance the pure flesh tints and *vis* glance of the girl. Nothing more natural than her *pose*, yet nothing more graceful and full of elastic life, held still for the moment. There is an *on ne sait quoi* of distinction in the bearing and type, the carriage of the head, the finely-formed hands; in the picture as a whole unmistakable style, absolute harmony, and a brushwork that is almost playful in deft surety. We have seen nothing more artistic from Herr F. KAULBACH, though some work more imaginative. The portrait picture of the two little *Sisters* in the upper room is, though charming, not so satisfactory.

Mr. WALLIS has gathered many interesting examples of new and old with this season's show. Among the latter must be noted the *Camp Followers*, by EUGÈNE FROMENTIN, a splendid study as regards the figures of the Arab women, though marred by a dull, and yet lurid, colouring. Two little pictures show the extraordinary cleverness in depicting within miniature limits the motley tumult of a carnival crowd in Rome, evinced by Señor F. PRADILLA, whose command of scale was patent in his fine pictures of *Donna Juana la Loca* in the Paris Exhibition of 1878, and the *Surrender of Granada* by *Boabdil* in the Munich International last year. A couple of rustic pictures, on the lines of M. LEPAGE, with rather more sentiment, and considerably less power, bear the well-known signatures of G. LAUGÉE and D. F. LAUGÉE. The conscientious desire of the last-named artist not to adorn the rustic figure with adventitious grace seems to lead him to exaggerate the size and shape of extremities beyond the bounds of veracious ugliness, and even to square out the form by angles that suggest dislocation of members.

The dramatic scene by ADOLF ECHTLER, setting forth the ruin of a Breton peasant household by the father grown madly desperate over the gaming-table, suffers from a certain showiness, but is certain of popularity for its strong narrative appeal. Show is the fault of the very clever picture by P. JOANOWITZ, the young pupil, early in his third decade of age, of Professor MÜLLER, of Vienna. A group of Servian men teach a little lad his sword-play, while women look on admiringly. The incident is telling, and with brilliant manner and the freshness of local type and of rich costume the picture is forced up to high pitch, and is, anyhow, remarkable for hardihood and technical assurance. Among the examples of cabinet scale perfection Herr SEILER holds his own for completeness. A small farcical study of a monk musician wiping his brow during *Five Bars' Rest* is by Signor ANDREOTTI, of whose lively cleverness Mr. MACLEAN has secured many specimens. The German landscape artist, Herr HEFFNER, at neither gallery has anything to show that he intends to pass the limits of a delightful but circumscribed study of watery lands under skies of serene calm or mustering clouds. This painter probably suffers, like many a greater man, from success with a public that is clamorous to have its favourite themes repeated rather than wise to urge an artist into "fresh fields and pastures new."

## THE IMPROVEMENT OF CENTRAL LONDON.

ON Monday last, a private conference of persons interested in London improvements was held at the Mansion House, by invitation of the Lord Mayor, in order to hear and consider a statement by Mr. WESTGARTH of his proposals for the reconstruction of Central London. These proposals have been before the public for some time, and those experienced in the conduct of public improvements in the metropolis seem to agree that they represent an undertaking too formidable to be within the range of practical realisation, as a whole. We hope however, that because Mr. WESTGARTH'S plans aim at more than is at present attainable, at any rate in one generation, they will not be summarily dismissed from the minds of public-spirited men. They contain ideas at once noble and practical, and they form a comprehensive programme such as might well be attacked in sections, though as a whole it may stagger even sanguine reformers.

We do not remember that any individual in our own day has come forward with such large and comprehensive views of this subject, or has shown such conspicuous public spirit as is evinced by Mr. WESTGARTH'S offer of no less a sum than 1,000*l.* in prizes for essays, &c., and by his personal advocacy of the improvements which he desires to see adopted. This alone claims public recognition, and well deserves to be met half-way by those who can render effectual aid in carrying a lofty ideal into practice. Mr. WESTGARTH'S proposed machinery of a Trust might be excellent if a definite improvement of a single locality could be taken in hand to begin with. There are one or two large properties belonging to the City and to great public bodies, which it is well known are likely to be available for improvement shortly, and are virtually in the market now. If such a Trust as has been suggested could be formed, and could secure, for example, that portion of the Bridge House Estates belonging to the Corporation which lies in Southwark, and which will very shortly fall in, together with adjoining properties; and, armed with Parliamentary powers, and the best professional advice, could proceed to remodel on a well-matured scheme the whole of the streets and buildings on that property, a magnificent result might be attained, and one easily within practical reach. There are some acres on the Middlesex side where an operation of the same sort would be possible, and we beg to suggest these to Mr. WESTGARTH and his friends as undertakings which might well receive their best attention, and which would at once command the support of all who are interested in the improvement of the Metropolis—a subject the urgency and importance of which is patent to every one whose business or profession brings him in any way into contact with buildings in London. We heartily wish Mr. WESTGARTH success.

#### PARIS NOTES.

THE International Exhibition of Painting, opened to the public on Wednesday last, the 2nd inst., in M. Georges Petit's Gallery in the Rue de Sèze, can scarcely be said to be worthy of its somewhat high-sounding title. Readers of *The Architect* will probably remember that the avowed object of these exhibitions, the first of which was held last year, is to place under the eyes of the public the distinctive styles in art of the principal nations—one artist, representing as nearly as possible the highest degree of native excellence, being chosen for each foreign country. On this occasion, however, although highly interesting and well worthy the attention of the public, the exhibition can only by a considerable stretch of amiability be recognised as international. It is, in fact, to all intents and purposes an exhibition of French art, for those among the contributors that bear foreign names are, we believe, with scarcely an exception, Parisians by adoption, and thoroughly in the swim of French life. They cannot, therefore, be regarded as representing the characteristic movements of art in the countries of their origin. Thus M. Van Beers, who among foreign painters takes the most prominent place in the gallery, has depicted scenes of Paris and French life in a spirit and manner that is distinctly Parisian, although there is an originality about the treatment of his subjects which gives him a place apart among other workers in the same field. Again, we may remark that no English or American artist has a picture in the collection, and an exhibition cannot be fairly termed international from which the Anglo-Saxon influence on modern art is thus absent.

In general interest the present exhibition is, therefore, far below the level of that organised by M. Petit last year, although it presents a good opportunity of studying the work of some prominent French artists. Even in this respect it is by no means comprehensive, as the following list of exhibitors will show:—MM. Bastien-Lepage, Béraud, Cazin, Duez, Carolus Duran, Roll, Egusquiza, Hellquist, Lieberman, Pasini, A. Stevens, Tofano, Van Beers, and Wauters.

The works of the first-named will almost certainly attract the largest share of attention. They are seven in number, including two portraits. One is that of Madame Drouet, the lady who did the honours of Victor Hugo's home until her decease a few months ago. It could not have been painted long before death; but the face, with its frame of white hair, is still beautiful, and the artist's execution will compare with the best examples of portraiture.

M. Cazin sends two fine works. M. Duez has four canvases, but nothing that is very striking. M. Carolus Duran contributes several portraits, and a painting, *The Caliph's Slave*, which is extraordinarily rich in colour. M. Roll exhibits four pictures, the most noteworthy being a forest scene and the full-length study of a lady in *déshabille*, with her maid fastening the corset. Among other exhibits may be mentioned M. Van Beer's *Flirtation*; *Correspondance au Café*, by M. Béraud; *Harmonie*, by M. Egusquiza; *A View of the Grand Canal* and *The Canonica Canal*, by M. Pasini; *The Open Sea*, by M. A. Stevens; and the portrait of a boy, by M. Wauters.

M. Emile Guimet, of Lyons, has made a gift to the City of Paris of his wonderful collection of more than 12,000 gods, goddesses, fetishes, and divinities of every description illustrating the history and rites of Oriental religions. Several Indian and Chinese priests are said to have presented the collector with many of these figures, in the belief that he was anxious to propagate the Buddhist religion in France as a substitute for Catholicism. According to the Paris papers, Mr. Monier Williams, of Oxford, offered M. Guimet 3,000,000 frs. (120,000*l.*) for his collection some time ago, only to meet with a decided refusal. The collection is completed by 12,000 volumes of Oriental literature, including 4,000 Japanese and 3,000 Chinese works. The only question remaining to be settled is whether the Municipal Council will erect a building worthy and capable of receiving this unique museum; and this point will be solved at one of its earliest sittings.

At its sitting of last Saturday, the Académie des Beaux-Arts proceeded to the election of a successor to the seat of the late M. Aug. Dumont, in the section of sculpture. As stated in last week's *Architect*, the only two candidates in the field were MM. Barrias and Mercié, decidedly the most distinguished of young French sculptors. The number of members present was thirty-six, and after three ballots, in which each candidate obtained eighteen votes; at the fourth essay M. Barrias was elected by nineteen against seventeen given to his competitor. The new member of the Institute obtained two "mentions" for busts in the Salons of 1859 and 1861, was Grand Prix de Rome in 1865, received a "second medal" at the Salon of 1870, a "first medal" in 1872, the "medal of honour" in 1878, a "first medal" at the International Exhibition of 1878, was created a Knight of the Legion of Honour in 1878, and promoted officer in 1882. His best known work is *Les Premières Funérailles*, exhibited at the 1878 exhibition.

The Salon jury in the section of painting has finished the first portion of its task, having examined every picture sent in; 2,378 works have been definitely passed, while 450 have been put aside for further examination. Of these, the jury will have to select 122 to make up the regulation number of 2,500. After this the drawings will be gone over to the number of 3,000, of which only 800 are eligible. Each work passed is marked either 1, 2, or 3, to indicate, except in the case of paintings of very large size, the row in which it is to be hung. The jury will have completed its work by the end of the present week.

The six competitors admitted to the final stage of the Grand Prix in medallion and jewel engraving have entered *loges*. The subject chosen by M. Cavellier for this competition is *Orestes at the Tomb of Apollo*.

The Roman antiquities discovered recently during excavations in the Rue Nicolle, and purchased from M. Landau by the City of Paris for 15,000 frs., have been placed on view at the Musée Carnavalet. The collection comprises 318 earthen vases of various shapes, glass vessels, utensils of iron and bronze, coins, skulls, and a cast made of the remains of a new-born infant of the fourth century.

The sale of oil and water-colour paintings, drawings, &c., by Louis Leloir, following the recent exhibition of the deceased artist's works, took place on Friday and Saturday of last week at the Georges Petit Gallery in the Rue de Sèze. The total amount realised in the two days was 135,000 frs.—*L'Eventail* fetching 10,200 frs.; two large panels representing *Hunting* and *Fishing*, 10,000 frs. together; *Un Intérieur de Harem*, 5,000 frs.;

*L'Arrivée du Printemps*, 3,600 frs.; *La Confiance*, 2,300 frs.; *La Fête du Grand Père*, 2,600 frs.; *Les Musiciens Ambulants*, 2,150 frs. Contrary to general expectation, the sale lacked "go," and there was a decided want of spirit in the bidding. However, considering the very incomplete state of most of the pictures, some of which were merely rough sketches or crude ideas, the prices realised were satisfactory. The sale of books, engravings, collection of arms, and other curiosities belonging to the deceased took place on Thursday, the 3rd inst.

M. Leopold Delisle, Curator of the National Library, has been elected President of the Committee on Parisian Inscriptions, in the place of M. Henri Martin, deceased.

M. Eugène Jolly, a promising sculptor, who had been confined to his bed by illness for some days, during an attack of delirium on Thursday, the 27th ult., threw himself out of a window on the third storey of his house in the Rue de Chartres, and was killed on the spot. The deceased was only thirty-seven years of age.

An extraordinary hitch has occurred in the first stage of the competition for the Grand Prix de Rome in painting. The subject given by M. Hébert, the artist delegated by the Académie des Beaux-Arts, was *Jesus Christ insulted by Soldiers in the Prætorium*, to be executed within twelve hours in the form of a sketch in oils on a canvas measuring 16 inches by 13 inches. At the last moment the competitors drew up a joint protest against this subject, on the ground that a similar one had been quite recently given in another competition. The painting section of the Academy was in favour of overruling the objection, but the Academy as a whole decided in favour of the students and cancelled the competition, which has been put off until next Monday.

English *habitués* of the Louvre on their next visit will find a considerable difference in the *Vénus de Milo*, which has been lately removed from its own gallery and erected provisionally in the Circular Room of the Musée des Antiques, before the red curtain that separates this room from the Seasons Gallery. The statue itself is also changed, the plinth having been shortened so that the fold of the robe training on the ground behind and to the left may be seen; the marble has, moreover, been cleaned, and now possesses an appearance scarcely in keeping with its character as an antique.

This week has been a busy one for would-be exhibitors in the architectural section of the Salon. According to the regulations their works had to be sent in between the 2nd and 5th inst., and any arriving after 5 o'clock this (Saturday) evening will be inexorably refused. Each exhibitor may submit two works, and has the right of sending also models in relief. The vote for the jury in this section will take place at the Palais de l'Industrie on Monday, the 7th, between 10 A.M. and 4 P.M.

### BRONZE CASTING.\*

BRONZE casting, a sumptuary art, followed for a long series of ages the fortune of the people who practised it; in Greece it reached its zenith during the reign of Alexander the Great, it was in a brilliant condition in Rome under Julius Cæsar and Augustus, in the reign of Nero it rapidly declined, and it was almost abandoned with the fall of the Roman Empire and the disappearance of Roman civilisation; during the invasion of the barbarians it is scarcely mentioned, and in the following ages its employment was confined to articles of household and daily use.

From this period we must pass without transition to the Middle Ages before meeting with works that can be placed in continuance of the sculptural art of the ancients; it was not till the twelfth century that bronze casting was to a certain degree revived, but in the fourteenth century such works were produced as the gates of the Cathedral of Pisa, and in the fifteenth century it had again reached its zenith, when the method of *la cire perdue* was in full vogue, and was employed by Ghiberti in casting his celebrated gate of the Baptistery at Florence, as well as generally by the sculptors of that period, especially by Benvenuto Cellini, who gives in his memoirs a detailed account of the process as employed by himself in casting the celebrated group of *Perseus and Medusa*.

All the beautiful statues of the Renaissance were cast *en cire perdue*; the result, however, was often uncertain, and the statues had frequently to be repaired and cracks and holes filled up in a way that is still visible in many cases. It is to be remarked that each bronze statue of that period was unique, since the model itself, as well as the mould, were broken up in the casting, thus rendering repetition impossible, and consequently greatly enhancing the value of every work of art thus produced. It is probable that certain artists employed different methods, as Benvenuto Cellini says of himself, but the basis of this system of casting was, and must have been, the same for all.

The artist who intended producing a work in bronze began by making a model of it in clay; this was baked, and served as the core, which was then covered with wax, and the work was completed by the artist in that material. The wax itself was then covered with repeated layers of prepared earth to form a mould, and the whole mass was then fired in a furnace, when the wax melted, and in melting left between the mould and the core a space of the required thickness of the bronze, and into this space the molten metal was run. What has hitherto prevented modern artists from employing this system is the circumstance that if the casting should fail the whole work is lost, including the original model.

By the process now employed at Brussels this is obviated, and if the casting fails it is only the labour of the founder that is lost. The model remains, and from it a fresh wax statue can be produced which must be repaired either by an artist employed for that purpose at the foundry or by the sculptor himself, who can then add the finishing touches to his work. It is the minute delicacy and accuracy with which every touch of the sculptor is preserved that gives the stamp of individuality and artistic value to works produced by this process.

The art of casting in bronze became naturalised in France under Francis I., who invited Benvenuto Cellini and other Italian artists to establish themselves in France, and built several foundries, the principal one being that of Fontainebleau; the manufacture of bronze was not, however, firmly established in France till 1684, when the Arsenal Foundry was built by Louvois, and placed under the direction of the brothers Keller.

The colossal equestrian statue of Louis Quatorze by Girardon was cast by the brothers Keller; it was intended originally to be placed on the Place Vendôme, then Place Louis le Grand, but was broken up at the first Revolution; one foot of the horse is, however, preserved in the Louvre as a specimen of the excellence of the bronze, the beauty of the work, and the colossal proportions of the statue, which was 7 mètres (about 26 feet) high, and was cast *à la cire perdue* at a single jet. The three legs of the horse, supporting the principal weight of the statue, were made of solid wax without a core, and consequently when cast became solid bronze, while the rest of the statue was only 16 millim. (five-eighths of an inch) thick. The weight of bronze required in this process is calculated at ten times that of the wax employed, and in this statue 3,000 kilog. of wax and 30 tons of bronze were used in the casting. The brothers Keller were the last founders of renown in France; after them the art of casting in bronze by the wax process declined, and at the beginning of the present century all practical knowledge of it was lost.

The sculptor Falconet, who was a contemporary of the Kellers, became a bronze-founder from necessity; not having been able to find at St. Petersburg a bronze-founder who would undertake to cast his statue of Peter the Great, after waiting for more than two years, he acceded to the repeated request of the Empress Catherine II., and cast it himself *en cire perdue*. At the first attempt the mould burst before it was filled, and the whole of the upper part of the statue was defective; the second casting was successful, with the exception of some cracks and holes which were filled up with molten bronze so effectually that it was impossible to tell where the statue had been repaired.

Although Falconet does not describe at length the manner in which he cast his statue, he mentions incidentally that he employed the wax process, since he relates that the bronze-founder Ersman, one of those to whom he had applied, declared that Falconet must be mad to attempt to cast a statue of that size with wax only three lines (a quarter of an inch) thick, that such a thing had never been done before, and that if he persevered in attempting it the casting would inevitably fail. Falconet remarks that in casting this statue twice he had learnt two things: first, that the modern art of casting colossal statues was imperfect, and, secondly, that it might be rendered perfect if sculptors and founders chose to take the trouble.

The bronze castings made under the First Empire were from moulds made on plaster models by an ingenious method known by the name of *moulage à la Française*, which is now employed in all French bronze foundries; it has the advantage of being economical, especially for large works, and is generally used in all the foundries of the north of Europe; it resembles in some respects the system practised in iron foundries, and is now employed even in Italy in preference to the wax process.

It must also be remarked that casting *en cire perdue* is not suitable for every style of sculpture. Works, for instance, requiring a smooth surface can, and indeed ought to be, cast by the ordinary

\* From the Official Report by Sir J. Savile Lumley.

French system, which produces metal of a closer grain and more polished surface, requiring, however, the use of the chasing tool over the whole surface to efface the marks left by the joints of the piece-mould, and the entire removal of what is called *la peau de la fonte*, the casting skin or "epidermis" of the bronze as it comes from the mould, and which, in the wax process, constitutes its peculiar charm, reproducing as it does a perfect facsimile of the original work as it left the artist's hands.

The ordinary method of casting is more suitable to the bronze articles of commerce which require frequent reproduction, as well as for bronzes intended to be gilt or silvered and burnished. The wax process, on the contrary, is adapted to unique artistic works not intended for reproduction; the casting skin, however, so dear to the sculptor, diminishes to a certain extent the beauty of the artificial "patina," or bronzing, which is always more brilliant on bronzes that have been worked over with the file and the graving tool. Although casting in bronze by the wax process was given up in France at the beginning of the present century, it has never been lost sight of altogether in Italy, from whence occasionally specimens have been sent to the annual Exhibition of the Fine Arts at Paris.

### ANGEVIN ARCHITECTURE.

SOME interesting papers entitled "To Auvergne and Velay and Back," by Mr. E. A. Freeman, are in course of publication in *The Guardian*. The following is an extract from the one published on Wednesday:—

It is hard to know exactly what to call the varieties of architecture which sprang up in the eleventh and twelfth centuries to supplant the older form of Romanesque which had once been common to all Western Europe, but which Germany alone, instead of casting aside, clave to and improved. It is not exactly difference of style; we find the same construction, and to a great extent the same details, in buildings the general effect of which is utterly unlike. It is rather a fashion in building, especially in church-building, a preference for a certain plan, a certain proportion, a certain kind of general effect, rather than any difference in style strictly so called. In this it differs from the national and local varieties of Gothic, which are real differences of style as far as they go. An English Perpendicular and a French Flamboyant church will commonly differ a good deal in their proportions, but, with a general agreement of artistic principle, they will differ a good deal more in details. The French building will commonly be the loftier of the two; it will have an apse, while the English building has a flat end; it will have a vault while the English building has a wooden roof. This is the rule; yet some English churches are lofty and some French ones low; some English churches have apses and some French ones have flat ends. The thing which is absolutely distinctive of England is the wooden roof made into an ornamental feature. But all these differences do not make at all so wide a diversity as we see between a Norman, an Angevin, and an Aquitanian church, the smaller details of which, say the string-courses and the capitals of the small shafts, may be exactly the same. There is, as we have hinted, a very marked Angevin mode of building, a mode of which Anjou may be looked on as the head-quarters, though it stretches into lands on both sides of that county. But we hardly know whether to call it an architectural style. As far as details are concerned, the difference in all these varieties lies rather in the use of the details than in the details themselves. Thus we nowhere find on the Continent the rich doorways and chancel-arches of our own Norman; but the mere details of these doorways, taken one by one, might be found almost anywhere. One variety has square piers, another compound piers, another columns, another has no pillars at all. But, allowing for the rule that, the further south we go, the more Classical things get, such capitals as there are may be exactly the same. We therefore hardly know whether we ought to speak of an Angevin style; but there is a very marked Angevin style of building. The buildings of the twelfth century in Anjou, and in the lands to which Angevin influence reached, can be known at a glance from the buildings of the lands to the north and south of them.

The main tendency of this Angevin variety is to make everything broad, and, by proportion at least, low. In the churches this is carried so far as to dispense with aisles, and therefore with piers or columns of any kind, to make the nave and choir each a single wide body. This tendency is found also in some parts of Aquitaine; but it is nowhere so strongly dominant as in the region of Angevin taste. What is done with width is also done with length; the bays of an Angevin church are always wonderfully wide, perhaps double the width of those in an English or French church. A nave which in England would consist of six or eight bays will in Anjou consist of only three or four, each of which will most likely contain two coupled windows much larger than they would be in England. In everything the tendency is to have a few large members rather than many small ones. There is a certain boldness and simplicity about this kind of treatment; but there is also a certain bareness, and an Angevin church looks

both lower and shorter than it really is. The fault is in some measure the same as that which makes some of the great churches of Italy, Saint Peter's to start with, look so much smaller than they are through using a few wide arches instead of many narrow. The Angevin treatment of the bays is further connected with the use of a kind of vaulting which, without being really domical, as it is further south, has somewhat of the effect of a cupola. There is also a fondness for the use of the Pointed form in the main arches when it is hardly any more a sign of coming Gothic than it is in Sicily or Aquitaine. And there are some smaller peculiarities, as a fondness for marked corbel-tables inside which would look more natural outside, which add to the characteristic effect.

The fashion, then, is very marked, and all the churches belonging to it have much in common. Yet it is curious to see how much variety it allows in individual buildings. We have already spoken in a general way of the churches of Angers, most of which have some parts belonging to this style, if style we are to call it. If we look at them as specimens of special Angevin taste, we shall see that, with great general likeness, each brings in some little modification of its own. Saint Maurice perhaps carries out Angevin ideas more thoroughly than any other in Angers. A cross church with the limbs of the same height, without aisles in any part, the apse therefore standing free without surrounding chapels, after a fashion rather German than French—though the tall windows of the German apses are not to be seen at Angers—two western towers and something like a third carried up between them where the nave gable ought to be—all this makes an outline strange in itself, and forms a marked contrast with the outline of Le Mans, no less strange in its own way. As seen from the castle walls, the outline of the cathedral is perhaps not so very strange; it does not differ greatly from that of an ordinary French church with western towers, and with the crossing marked by a mere *louvre* or, as in this case, not marked at all. The lack of aisles is hardly seen, and the odd position of the towers does not strike the eye. But even in that view we take in something of the simplicity of the building; in most French churches, in many English, some inkling of pinnacles and flying-buttresses would have made itself felt. Saint Maurice, we need not say, has no need of them. When we come close to the church, a number of parasitic buildings on the south side hinder its whole outline from being clearly seen. But the east and west ends stand free. The apse, round below, polygonal above, with windows of early tracery, rises boldly above a small open space, where a noble wooden house almost divides our attention with the church. And the west front may be studied with ease in all the fulness of its eccentricity. Two western towers where there are no aisles are in themselves an anomaly, though it must be remembered that such was the arrangement of Ripon in its first state. One great tower, as at Alby, is surely more natural. Here we have two very narrow flat towers, without buttresses and with the middle stages slightly overhanging; the upper stages seem to be that kind of late imitation of Romanesque which is not uncommon in some of the towers further south. The front, remarkable for a single splendid doorway with most bold and striking sculpture, is otherwise as bare and flat as it well can be; the only relief that there ever could have been was a couple of blank arches on each side of the doorway. The history of these towers is odd. They were once finished with wooden spires, and were, like some German towers, joined by a wooden bridge. Early in the sixteenth century, about 1516, spires and bridge were rebuilt of stone, and one cannot help fancying that it was now that the upper part of the towers themselves was built. A series of changes now followed; a fire in 1531 caused a rebuilding of the north tower in a richer form, and the third tower, if such it is to be called, arose between the two, crowning the west doorway and window, instead of the gable of the nave, or in this case only so much of it as chanced to come between the two towers. It is of the same pseudo-Romanesque as the upper part of the towers, the cupola belonging more distinctly to the Renaissance. Altogether, strange but not beautiful, worth a journey because of its singularity, is the verdict which we must pronounce on the west front of St. Maurice of Angers.

When we go within, we find the Angevin idea most thoroughly carried out, except in the apse, which is surely later. The church does not do justice to itself in any of its dimensions. It looks far lower than it is, and three wide bays of the typical kind, three bays of Angevin vaulting, three wide, blank, pointed arches against the wall, in a space where anywhere but in Anjou we should have six bays, make it look much shorter than it is. One is really driven to believe that the Angevin architects did not wish their churches to look long or high, and the more we wonder at their taste, the more curious we find their works as a matter of study.

Messrs. Carter & Co., of Poole, have just completed two large hand-painted tile panels for Messrs. W. E. Williams & Son, architects, of 2 Ludgate Hill, at the following addresses:—"The Shakespeare," Meyrick Road, Battersea, and "The Welsh Harp," Aylesbury Street, Clerkenwell, representing respectively a scene from "As You Like It," and "The Massacre of the Welsh Martyrs." Both works have been highly commended.

## NOTES AND COMMENTS.

ONE hundred and twenty-seven designs for the new Admiralty were received on March 1, and on the last day of the month it was officially announced that nine designs had been selected, the authors of which will be invited to take part in the second and final competition. The selection of ten designs was anticipated; for although the condition stated that the judges had power to select such less number as they may think fit, it is usually the practice to give as large a number as possible a second chance. The list will be a surprise to many. With two exceptions (Messrs. VERITY & HUNT's and Messrs. ASTON WEBB & INGRESS BELL's) the designs selected are not those which were generally supposed to be likely to gain success, and until an exhibition is held there will be dissatisfaction with the decision.

THE names and addresses of the authors of the selected designs are as follows:—Messrs. GLOVER & SALTER, Queen Anne Chambers, Poultry, E.C.; Messrs. HENRY HALL & W. H. POWELL, 19 Doughty Street, Mecklenburgh Square, W.C.; Messrs. LEEMING & LEEMING, North Gate Chambers, Halifax; Messrs. MAXWELL & TUKE, 29 Princess Street, Manchester; Mr. THOMAS PORTER, Dulwich Wood Park, Norwood, S.E.; Messrs. SPALDING & AULD, 91 Queen Victoria Street, E.C.; Messrs. MALCOLM STARK, jun., and JAMES LINDSAY, 248 West George Street, Glasgow; Messrs. VERITY & HUNT, 27 Regent Street, S.W.; and Messrs. ASTON WEBB & E. INGRESS BELL, 19 Queen Anne Gate, Westminster, S.W. Six of the designs, it will be seen, were produced in London. There will be a supplementary set of conditions issued for the second competition. The new plans will be on a scale of 16 feet to the inch, instead of 24 feet, and will become the property of the Government. Each selected competitor is to be paid 600*l.* towards his expenses.

THE last Yorkshire Fine Art and Industrial Exhibition, although it was unusually attractive in pictures and other works, has not been a financial success. Compared with the former year's returns there has been a decrease of 129*l.* in payment for admission, 122*l.* in the rent for space, 330*l.* in season tickets, and in other items 107*l.*, making in all a decrease of 688*l.* These figures are another proof of the depression which has been overspreading the country. The sum will be borne by the guarantors, and is not likely to deter the promoters from holding another exhibition.

THE paper read by Mr. ELIJAH HOOLE at the Society of Arts on Wednesday upon "Workmen's Dwellings" is an important contribution to the discussion of a pressing question. Mr. HOOLE considers the best way of giving accommodation to a class that is regarded as a residuum by the conservators of the ordinary model dwelling. Cardinal MANNING, who presided at the meeting, said that benevolent people overlooked the enormous difficulty of rehousing the poor, as they seemed to think that houses which were unfit for human habitation ought to be demolished at once, and suitable houses erected forthwith on the sites. Mr. HOOLE was able to point out some cases in which the best intentions were defeated by existing laws. In one wretched court in the City it was found impossible, owing to rival interests, to adopt any other course than the selling of the freehold or the keeping of the old houses in some sort of repair for labourers' dwellings. The Commissioners of Sewers would not allow the latter course, the tenants were ejected, the owners are unable to rebuild the houses for them, and thus the ground is certain to be covered with warehouses and offices.

THE Metropolitan Building Acts, according to Mr. HOOLE, are inadequate to meet the difficulties which beset the sanitarian in respect to overcrowding. They contain no restriction upon the conversion of a house into tenements, and require no additional sanitary or other provision for the twenty or thirty extra people crowded into them, and no adaptation to their new purpose. The Acts define the size of a hearth to an inch, and they prescribe the thickness of a wall to half an inch, they enlarge at great length upon that sacred institution the party-wall, but not one word is said against making a house built for one family serve for ten, nor, if this is done, do they prescribe any addition whatever to the arrangements or accommodation. It is no exaggeration to speak of such excessive

overcrowding. There is a court in St. Pancras of which the freehold belongs to one of the City Companies, and at one time the houses which were built for a single family contained a family in each room. As Cardinal MANNING said, how is it possible to maintain domestic relations when a family is cooped up in a room nine feet square and seven feet high?

FEW people who have not had occasion to investigate the district have a notion of the network of courts and alleys which exists between Paternoster Row and Newgate Street. Panyer Alley, the nearest to Cheapside, is not to be taken as a specimen, for it is nearly straight; but some of the others are blind alleys, or are connected in a way that puzzles the stranger. In all London there is no place less adapted for the operations of a fire brigade. On Wednesday evening a fire arose in a printing office in one of the narrowest, and but for the promptitude with which Captain SHAW was on the spot, it is impossible to say where the damage would have ended. The question deserves consideration whether, considering the proximity of St. Paul's Cathedral, more care should not be demanded in the erection of buildings in the neighbourhood. Flimsy structures can be put up so long as the provisions of the Building Act are satisfied. But the numerous warehouses and manufactories around the Cathedral should be constructed only of fireproof materials, or of materials that will burn slowly. The ease with which the buildings in the Row were destroyed on Wednesday night must give rise to grave apprehensions in respect to the ultimate fate of St. Paul's.

THERE was an example of the lack of mercy which always marks attacks on architects in the string of questions relating to the architect of the Irish Board of Works which were addressed to the Secretary of the Treasury, on Tuesday, in the House of Commons. They are worth printing as a curiosity. The Secretary was asked whether Lord CRICHTON's Commission of Inquiry had not recommended that Mr. OWEN, architect to the Irish Board of Works, should be called upon to resign; for what reason the recommendation in question has never been carried out; if Mr. OWEN, while holding the position of architect to the Board, was also chairman to a discount company which became insolvent, and whether he has likewise, in recent years, acted as director of several commercial speculations which resulted in failure; if Mr. OWEN, whilst an architect to the Board, officially concerned with the business of dealing with applications for loans of public money to tenants and other persons, was also chairman of a private loan company, and whether, in consideration of his resigning the chairmanship in question, the Treasury allowed him an increase of salary of about 200*l.* per annum; and what is the explanation of the course pursued with regard to Mr. OWEN. There was no difficulty in giving replies. Mr. OWEN had been the chairman of a Civil Service building society, but at the suggestion of the committee he resigned that post and the chairmanship of the discount society. His increase of salary was simply a reward of long years of good service to the State.

THE French have always excelled us in the preparation of handbooks on literary, artistic, and scientific subjects. England has no series that will bear comparison with the old "Maitre Pierre," the "Bibliothèque Populaire," the "Petits Traités" of the Academy, the Manuels Roret, &c. An important addition to publications of that class is about to be issued from the Librairie de l'Art, under the title of "Bibliothèque Populaire des Écoles de Dessin." There are to be three classes of handbooks, which will be addressed to elementary students, advanced students, and the general public. The first will comprise books on construction—the orders, anatomy, decorative composition, stone cutting, &c. The subjects of the second class will be the applications of art, as seen in tissues, paper, enamels, ivories, furniture, arms, bijouterie, &c. The two will correspond with the courses in the art schools. The third class will consist of volumes on costume, the art of various ages and countries, the great French museums, sculpture, architecture, &c., and the treatment of the subjects will be more popular. The volumes have been prepared at the suggestion of professors, and are another proof of the vigorous efforts which are being made by all classes to retain the old supremacy of France in industrial art. M. RENÉ MÉNARD, one of the professors of the École Nationale des Arts Décoratifs, is the editor. In order that the series may be available to all students and apprentices, the price of each volume will be only 75 centimes.

## ILLUSTRATIONS.

GENTLEMAN'S CLUB, ST. LEONARDS-ON-SEA.

THIS building is now in course of erection for the directors of the new club company. It occupies one of the finest sites on the Parade, in the most fashionable part of St. Leonards, and commands magnificent views of the sea coast and Parade.

The new club will contain large coffee, smoking and billiard-rooms, and card-rooms; also ten bedrooms, bath-room, &c., for the convenience of London and country members. The chief entrance to the building faces Warrior Square, and will be protected from the winds by a large porch, the floor of which, as well as the whole of the corridors, lavatories, &c., are to be laid with marble mosaic by Mr. BURKE. The grand staircase and entrance framing, &c., will be of polished walnut. The building will, in all probability, be lighted by the incandescent electric light, for which the necessary arrangements have been made. The architect to the company is Mr. HENRY WARD, A.R.I.B.A.; Mr. PETER JENKINS is the contractor.

RESIDENCE, WEST FERRY, DUNDEE.

THIS house, just completed, is situated three miles east of Dundee. The grounds are elaborately laid out, and with the view of preserving the best points of outlook. Southwards are the Fife Lomonds and Northmen's Land. The river Tay is visible from near Perth to its estuary. On the opposite shore lie the ancient villages of Newburgh-on-Tay and Balmerino. To the south-east are visible the towers of St. Andrew's. On the north stretch the Sidlaw Hills, with the intervening fertile valley of Strathmartine.

The house is planned to furnish the accommodation usual in a modern residence. The interior is ornate, and has been carefully finished by the different tradesmen. The work has been carried out from the designs and under the superintendence of Mr. G. S. AITKEN, architect, of Dundee.

HEADQUARTERS AND DRILL HALL, GLASGOW, FOR THIRD LANARK RIFLE VOLUNTEERS.

OPERATIONS have just been commenced for the erection of new drill hall and headquarters for the Third Lanarkshire Rifle Volunteers, on a most convenient site in Coplaw Road, in the southern district of Glasgow. Plans for the building have been prepared by Mr. J. B. WILSON, A.R.I.B.A., Glasgow, one of the officers of the regiment, and we publish this week a perspective view of the principal front, from the architect's sketch design.

The drill hall will be 142 feet long by 72 feet 6 inches wide inside, and will be roofed in a single span with an iron roof, leaving the whole floor space free of any obstruction. The roof will be lined internally with stained and varnished wood lining, the iron construction exposed and decorated. The interior walls of hall and all passages will be lined to a height of 5 feet with white enamelled bricks relieved with coloured bands, and above to the wall-heads with fine red pressed bricks also similarly relieved. It is intended to lay the floor with solid wood-block flooring set herring-bone pattern. As there are at present no halls suitable for large public meetings in the district, the scheme proposes to meet this requirement, as well as to provide suitable accommodation for the regiment. For this purpose the drill hall has attached a large platform or stage, with suitably-arranged retiring and dressing-rooms, and other accommodation.

Besides the drill hall, there are on the ground floor of headquarters a large reading and meeting-room for members, sergeants' room, quartermaster's office and store, armoury and armourer's workshop, lavatories, &c.; and there will be also a large and well-appointed gymnasium. On the first floor are officers' mess-room, adjutant's room, and orderly room, with lavatories, &c., and above are dressing-rooms fitted with uniform lockers, &c., and the caretaker's house.

It is expected that the buildings will be entirely completed in time for the winter drills, which commence early in January. The estimated cost is about 4,000*l*.

HOUSE, HOOLE ROAD CHESTER.

THIS building has been lately erected, from the designs of Mr. F. ROBERTS, architect, Chester.

CASKET, SOUTH KENSINGTON MUSEUM.

THE casket which forms the subject of the illustration is one of those early works which are to be found at the South Kensington Museum, although it is generally supposed that the examples do not extend so far. The sculpture in this case is remarkable, and, like much other Runic work, gives opportunity for archaeological discussion. The original drawing is by Mr. JOHN E. INGLIS.

## THE ARCHITECTURAL ASSOCIATION.

THE tenth ordinary meeting of the Association was held on Friday evening, the 28th ult., Mr. Cole A. Adams, president, in the chair. A vote of thanks was passed to Mr. Anderson, the architect of the Scottish National Church, Belgravia, for conducting the members over the building. The next visit was announced for Saturday (to-day), April 5.

The PRESIDENT then referred to the decease of Prince Leopold. Englishmen, as a body, were entirely in sympathy with Her Majesty in this terrible loss. It would be out of place for them to pass anything in the shape of a vote of condolence, but he thought they might express silently their sympathy with the Queen, and their regret at the loss that art and literature had sustained in the death of the Prince, who, though young in years, was pre-eminent in learning.

Mr. W. E. RICH then read a paper on—

## Water Supply to Country Houses and Isolated Public Buildings.

In every age of the world and in every clime the prudent man has pitched his camp and built his house on a site where good water can be obtained. A good foundation is necessary for the stability of the building, but the water supply is equally essential to make it habitable. Of many an ancient dwelling or village even the ruins have perished, but the spring or well, which was the oldest institution in it, remains and still attests the prudence of the founder. The British or Roman camp, wherever it was situated, could not withstand a siege without a reliable water supply, and it is most interesting to those who study such works to identify the source of water in each case. Frequently there was a well within the circumvallation. In other cases there was a well or spring external to the walls, with a covered way, which is easily identified now, for the protection of those who sallied out to it for water. In others the camp was extended on one side towards the valley specially to include some spring. I should think it probable that in some of the Roman camps on the elevated chalk downs of southern England, storage reservoirs and gathering grounds, and perhaps even ponds, were sometimes constructed for their water supply. In the mediæval castle the well is still pointed to frequently as an object of note—e.g., the wells at Carisbrook and Warwick. When the beleaguered garrison depended only on the surrounding moat for its supply, we frequently hear that it was decimated by disease, and surrendered in consequence. The old English monastery was generally placed beside a stream which drove the mill, and was dammed up to form the fish-stews, and there was almost invariably a good well or spring within the enclosure. The homesteads and villages of old England clustered round the springs of water, and the highways passed by them; and the same process of natural selection of sites for habitations still goes on in every new country which is being rescued from the waste. As a rule the habitation was taken to the water, and the first tendency, no doubt, was to place it beside a running stream and dip out of it; but the stream failed or became foul in summer, and was muddy after rain, and the settler would soon follow it to its source, and prefer the clear spring where it first bursts forth. If that is situated, however, in a position unsuitable for the dwelling, the ingenious man would either convey it by an aqueduct, as was no doubt often done in the luxurious days of ancient Rome, or would make an artificial spring by digging a well on the site of the house.

No doubt there have been blunderers in times gone by who have neglected such principles as I have enumerated above. From my own experience I am tempted to think that the nineteenth century must shine pre-eminent in the instances it affords of houses built without a thought of whence water is to be obtained. No doubt there is a natural tendency at the present day to select more elevated sites than formerly for our dwellings, and this has something to do with the evil. The man escaping from the smoke and close atmosphere of a city, where he gets all the water he wants without even thinking whence it comes, naturally seeks a bracing situation on high ground, perhaps close to the summit of a hill, and too often starts his house before he has given a thought of where the water which will minister so much to the future comfort and health of his household is to come from.

Now it has fallen to my lot to give considerable attention to the subject of water supply to isolated country mansions and public institutions during the last sixteen years, and too frequently, I regret to say, I have only been called upon for advice when

the building has been already nearly completed. I venture to think that the hydraulic engineer's opinion might with most advantage be sought at an earlier stage, when the exact site for the house is being selected and the general plans and elevations are under discussion, as it is a great gain to have the house in proximity to a knoll higher than its roof, on which a reservoir of ample dimensions can be constructed; and, in the absence of such natural advantages, a tower, capable of receiving a large elevated tank higher than every part of the roof, should be a notable feature. The provision of water on the site selected should also be one of the earliest operations, as the cartage of water is often a serious item in a builder's estimates, and in some cases would help materially towards paying the cost of the permanent waterworks.

A direct gravitation supply from a natural spring or stream higher than the house is in every way the best when it is obtainable, as it is frequently in the hilly districts of the north and west of England, Wales, and Scotland, where the rainfall is large and the rock surfaces are almost impermeable; but in the cretaceous and oolitic districts of the south and east of England elevated streams are rare. The Earl of Kenmare's house at Killarney is supplied from springs about  $1\frac{1}{2}$  miles distant. They yield about 15,000 gallons per day, and are collected in a covered reservoir holding 30,000 gallons, and situated at an elevation of 110 feet above the house floor. The water is conveyed thence to the house in a 4-inch cast-iron pipe, which bifurcates into fire-mains and service-pipes for drawing water direct all over the establishment. When water is very scarce on high ground, material dependence has to be placed on the rain-water gathered from the roofs into large storage reservoirs; and it is well known in the west of England that the rainfall on the roof of an ordinary agricultural cottage will suffice for all requirements of its inmates if a moderate capacity of storage reservoir be provided. For large establishments so situated an artificial gathering ground is preferable. At Sir Greville Smyth's, at Ashton Court, near Bristol, a half-acre plot of sloping ground, near the summit of a hill behind the house, is covered with a floor of impervious concrete, with surface gutters for conveying any water falling on it to a 40,000 gallons covered reservoir below. For every inch of rainfall upon this area about 8,000 to 10,000 gallons of water should be delivered into the reservoir. When gravitation supply is impossible there is no help for it but to have recourse to artificial pumping in some shape or other, and the several ways of pumping must be considered. But it is well to consider the question of pumping with that of the source of supply. A well should be like Cæsar's wife, above suspicion. It should never be in or very near an inhabited house. The further it is off the better. It is better closed in than open. The number of hand-pumps in the world probably exceed that of any other machine, and most small private establishments in the country depend on such pumps for their water supply, but they are ill-fitted for large houses full of modern sanitary appliances and other apparatus for using and wasting water. A man working a hand-pump for an hour would scarcely do more than 60,000 foot-lbs. of useful work in that time. One gallon of water weighs 10 lbs., so if the water in the well is 100 feet below that in the tank to be supplied, he will only raise 60 gallons in that time. Similarly, if two men work together, they will raise 120 gallons in that time, and if the gross lift be only 50 feet, they will, together, raise 240 gallons, but even that is no more than a leaky water-closet will waste in twenty-hours without being noticed. The nineteenth century rebels against the employment of thinking beings as mere "drawers of water," and thus it is better to replace manual with horse-power in large establishments. Roughly, a horse would do about ten times as much as a man, or would raise about 600 gallons per hour 100 feet. Working six hours a day a horse would thus raise about 3,600 gallons, but he would not be fit for much other work afterwards in the same day. When a horse is employed it is better he should be yoked into an ordinary pole horse-works, with a circular path from 20 to 24 feet diameter, and he would work at two and a half miles per hour, and should thus drive three throw pumps. Twenty years ago an American type of horse-works, in which the animal stood on an endless band and pressed it backwards beneath his feet, was much employed, but it was found to be very dangerous, and many excitable horses were killed or ruined in working them. Mules or donkeys are frequently used similarly for pumping, and, considering the sorry fare which contents them, are more economical *pro rata* than horses.

The lecturer then went on to explain in detail the numerous mechanical appliances for pumping purposes—water-wheels, windmills, steam and gas engines, &c., and gave a full description of the hydraulic ram and its action. He next went fully into the subjects of reservoirs, water mains, constant service, fire service, &c., hydraulic lifts, filtration of water, &c., and concluded with examples of works carried out on various estates and mansions and public institutions. Allusion was made among these examples to Worcester Cathedral, which Mr. Rich spoke of as an isolated building in the middle of a city. There was an immense amount of wood-work, he said, in the tower, for carrying the bells. This wood-work was very dry, and far above the reach of the fire-engines in the city. To meet the risk of fire, engines had been placed in the crypt to work pumps. A pipe was carried up into

the tower, with fire-cocks and hose at every stage, providing a supply of water to any portion of the tower where it might be needed. By means of a rose and spray a thick rain of water could also be showered all over the wood-work in the tower.

Professor KERR proposed a vote of thanks to Mr. Rich for his lecture, which was, he said, one of the very best he had listened to in his life. As a member of the Society upstairs, he must say he envied the members of the Association upstairs—they did not get such lectures. Mr. Kerr, in the course of his remarks, observed that we had a great deal too many pipes in our houses—pipes for drainage, gas, heating, and water-supply. Some houses were more filled with pipes than anything else. When a lady or gentleman took a complete fancy for filling the house with pipes, the end was that the pipes became so numerous and so complicated that, instead of being a benefit, they were the contrary, and, metaphorically speaking, the house was always in hot water. Mr. Rich had shown how simple a matter the complete water-supply became, if administered on the proper principle, and how it could be brought to the house, and distributed over the house in a proper way, and without a constant reference to repairs; and thus enabled the inmates to maintain health and cleanliness, for both of which water, and water in large quantities, was necessary. It was to our discredit in this country that we did not value water-supply as we ought. The London water-supply was a disgrace to human ingenuity, and when we looked at what had been done in New York on the one hand and in Glasgow on the other, it was impossible to think how the London water-supply could be submitted to.

Mr. L. C. RIDDETT seconded the vote of thanks, and

Mr. H. D. APPLETON also spoke in support of it.

Mr. HEATHMAN, manager to Messrs. Merryweather & Son, considered the system of roses and sprays objectionable on the score of insufficiency to cope with fire, and the difficulty of testing them periodically.

The PRESIDENT then put the vote to the meeting.

Mr. RICH replied, and, in the course of his reply, alluded to Mr. Heathman's observations on Worcester Cathedral tower, saying that he himself did not consider a spray alone was to be relied on. Still it was something, and in addition to this there were the fire-cocks and hose on every stage, all of which would do good service if the need arose. The jets also were tested periodically.

## ARCHITECTURAL EXAMINATION IN GLASGOW.

AN examination in architecture in connection with the Royal Institute of British Architects was held in Glasgow in the last week of February. The following is a list of the candidates who have been successful, the names being given alphabetically:—Jas. Ledingham, 1 New Ivegate, Bradford; Alexander M'Gibbon, 8 Douglas Street, Glasgow; James A. Williamson, 2 West Preston Street, Edinburgh; and Alexander B. Wilson, Brisbane, Queensland. The candidates who have passed are now eligible for election to the associateship of the Institute. As this is the first examination of the kind that has been held out of London, a few particulars regarding it may be noted. The candidates were first required to submit probationary drawings, and these being approved of were admitted to the examination. The first four days were occupied in answering, in writing and by means of sketches, the questions contained in a series of printed papers supplied by the Board of Examiners of the Institute, and among the subjects embraced were the following:—The history of architecture, sanitary science, strength of materials, shoring, construction, the writing of specifications, estimating, and professional practice. In the history of architecture the candidates are required to show a general knowledge of the leading architectural styles, and a more particular acquaintance with some one style selected by the candidate himself. The examination included the planning and designing of a building for a given site, a list of the accommodation required being furnished. On the fifth day the oral examination took place, and was conducted by Mr. Arthur Cates, chairman of the Board of Examiners, and Mr. J. Macvicar Anderson, hon. secretary of the Institute, and a committee of the Glasgow Institute of Architects appointed for the purpose, of which Messrs. Campbell Douglas and T. L. Watson were convener and sub-convener respectively.

## THE MANCHESTER ART MUSEUM.

ACCORDING to the *Manchester Guardian* a serious difference has arisen between the members of the Manchester Art Museum Committee and the Parks and Cemeteries Committee of the Corporation, relative to the space which it was understood the Art Museum Committee were to have at their disposal in the new art gallery in Queen's Park. The position of the latter body has been fully set forth in a letter addressed to the Parks Committee, which was laid before them and considered at their meeting on Friday. Mr. Horsfall and his colleagues assert that there was a distinct understanding that the whole of the space on the first floor

of the new museum would be entrusted to their charge for four years. With this assurance the committee of the art museum collected funds and enlarged their collections, which now contain works of art estimated to be worth at least 5,000*l*. Since, however, the intimation from the authorities of South Kensington that they would if necessary lend as many works of art as would fill the building, the chairman and the treasurer of the Art Museum Committee have been informed that the Parks Committee "do not consider that they have promised to carry out the conditions specified in the offer made by the Art Museum Committee, and accepted on May 12, 1882, by the Parks Committee." On this point it is remarked that "those conditions were distinct, specified, and thoroughly understood on both sides when the resolution of May 12 was passed," and the proposals since made by Mr. Alderman Harwood "amount to a virtual repudiation of the agreement." Under the circumstances they are compelled to ask the Parks Committee to carry out in its integrity the agreement made with them, that they shall have the management of the rooms on the first floor of the museum for four years from the time of opening. It was left to the chairman, deputy chairman, and town clerk to consider the letter and prepare a reply on behalf of the Parks Committee.

### THE WELLINGTON STATUE.

IT is understood that the General Committee whom the Prince of Wales, with the sanction of the Queen and of Her Majesty's Government, some time since invited to co-operate with him for the proposed improvements at Hyde Park Corner, have agreed to adopt a report which has been drawn up for them by an executive committee.

That report deals fully with all the various suggestions which have been made for disposing of the present colossal statue of the Duke of Wellington. Various sites have been indicated as suitable for the reception of the statue, Chelsea Hospital, Wellington College, Portsmouth, a site in Hyde Park, and other places have each had their advocates.

The committee, however, after very careful consideration, have come to the conclusion that no other site offers the same advantages as that of Aldershot. On national and military grounds this appears to be the most appropriate position that could be chosen. At Aldershot the figure of the great Duke will be highly appreciated by the whole army, among whom it is most fitting that the statue should find a permanent home. The site selected is close to the headquarters of the general officer commanding, on an eminence overlooking the town and permanent barracks. It has been ascertained that the removal can be effected without difficulty and at small cost by the Royal Artillery.

It was at one time contemplated by the Government to invite a limited number of selected artists to compete for the new statue of the Duke, which it is proposed to set up in the open place near Apsley House. This idea of competition has been abandoned. It was found that the best sculptors would not compete, and that such a method would not result in the production of a work of art worthy of the subject and of the nation. Moreover, the present representative of the Duke of Wellington, to whose wishes and views in such a matter it was felt that the greatest deference was due, was entirely opposed to competition. It was therefore decided to entrust the execution of the new equestrian statue to Mr. Boehm, R.A., whose skill in modelling horses is unrivalled.

Those who would fain retain the present colossal statue have laid great stress on the argument that both man and horse are portraits from life. This argument, however, is refuted by the simple fact that the Committee have the authority of the present Duke of Wellington for saying that his illustrious father did not sit to Wyatt for the statue, and that the horse was modelled, not from Copenhagen, but from a thoroughbred named Recovery, three years after the death of the famous charger. Furthermore, the Duke is represented as he was supposed to have appeared at Waterloo; but the statue was not made until thirty years after, so that the sculptor had only the bust by Nollekens to guide him as to the likeness of the Duke in 1815. It deserves to be mentioned that these statements have been contradicted. The son of the sculptor says that the Duke did sit for the likeness. As to Copenhagen, Mr. Wyatt knew the horse well for years before its death. There are two paintings of Copenhagen in existence, the one by Lawrence, with the Duke mounted, in the possession of Lord Bathurst, the other the property of Lord Penrhyn. There exist, therefore, the same materials for a successful portraiture of the Duke and his charger which were available for Mr. Wyatt, and the Committee have confidence that Mr. Boehm will produce a work of art which shall be in every way worthy of his subject.

An Executive Committee has been appointed for the purpose of laying out the place, which is temporarily divided into triangles by the intersecting roads. Fountains and appropriate lamp standards will form the only decoration, as it is not proposed to introduce any other statue than that of the Duke of Wellington.

One work of great importance which it is desired to undertake in connection with these improvements is the completion of the arch as designed by Mr. Decimus Burton. The original drawings

and model of the arch, now in the possession of the Royal Institute of British Architects, who have kindly lent them to the Committee, show the treatment which the architect had intended to adopt. This includes an enrichment of bas-reliefs and sculpture surrounding the plinth which was destined to carry a quadriga.

Towards these works, which will involve a very considerable expenditure, the Government have promised to ask Parliament to contribute 6,000*l*., which is the price of the equestrian statue with a simple pedestal. The remainder it is proposed to raise by public subscription. A first list of subscribers will shortly be published, and in the meantime the Duke of Bedford and Sir Thomas Brassey have each announced their intention of contributing 1,000*l*.

### ST. GILES'S CATHEDRAL, EDINBURGH.

THE scaffolding was removed from the new west doorway of St. Giles's Cathedral on Saturday. In the niches above the arch is a series of statues representing famous Scottish kings, queens, and ecclesiastics, some of whose names are more or less intimately associated with the ancient pile. There are twelve statues in all, including six kings, two queens, and four churchmen—the royal personages occupying the six whole and two half upper niches, while the four lower ones are appropriated to the divines. Taking first the sovereigns, and beginning at the left hand of the upper line of niches, we have them in the following order:—(1) Alexander I., who erected, on the site of the present cathedral, the first church in Edinburgh certainly known to have been dedicated to St. Giles. He appears clad in mail and wearing the conical helmet with "nasal" peculiar to the period. (2) David I. is arrayed in graceful kingly attire, and holds a sceptre in his right hand and a book in his left. This monarch is understood to have materially forwarded the endowment and decoration of St. Giles's. (3) Alexander III. stands resting on a sword which is held by both hands, the countenance exhibiting the sternness and determination which characterised the hero of the battle of Largs. (4 and 5) figures of Queen Margaret, and Margaret, the consort of James IV., are disposed in the two half niches. (6) Robert I., the Bruce, is represented in the plate armour which began to be worn during the reign of the conqueror of Bannockburn; the right hand rests on the Bruce's favourite weapon, the battle-axe, while the left, holding a sceptre, is supported by a shield. (7) James I., the Poet-King, appears in the ermine of royalty, with a scroll held to the breast, and a happily-caught attitude of pensive meditation, suggestive of the author of "The King's Quhair." (8) James IV., displaying a banner held in the left hand, is encased in the seemingly impenetrable armour of the period. Passing to the ecclesiastics, in the lower row of niches, and commencing, as before, at the left, there are to be noted—(1) Gawin Douglas, the second Provost of St. Giles's, a massively disposed figure, effectively draped, standing in thoughtful attitude, and holding in his crossed hands the pencil and paper indicative of poetic pursuits. (2) John Knox, in the well-known Venetian gown, with beard hanging down on the chest, and hands demonstratively exhibiting an open Bible. (3) William Forbes, the first Episcopal Bishop of Edinburgh, in the attitude of benediction, supported by a crosier held in the left hand, and wearing the mitre and appropriate vestments. (4) Alexander Henderson, a champion of Presbyterianism against Prelacy, shown in loose-flowing robe, surmounted by a ruff encircling the neck, and holding a slightly-opened Bible in the right hand, as if in the act of argumentation. The whole work in connection with the doorway, with its elaborately enriched mouldings and gracefully foliated caps, its large panel in which is sculptured *Sanct Geill and his Hynde*, its smaller panels containing the Four Evangelists, and the niches and statues above described, forms a notable addition to the architectural features of the city. The design, by Messrs. Hay & Henderson, architects, has been executed by Mr. John Rhind, sculptor.

### IRISH ART.

THE annual meeting and drawing of prizes of the Art Union of Ireland took place in Dublin on Tuesday. Viscount Powerscourt, who presided, said he was glad that the members of the Royal Hibernian Academy had taken the wise step of opening their exhibition on Sundays at a low charge. This could not fail to do good by enabling classes which had far too few refining influences within their reach to avail themselves of the intellectual treat of examining the works of art there. He congratulated the academicians on becoming in this matter in advance of their brethren in London. He hoped that a succession of rainy Sundays would convince the Archbishop of Canterbury and others that it might be well to provide some intellectual public recreation under shelter from the weather as an alternative to the public-house. There were two matters connected with art in Ireland specially worthy of attention at the present time. The first was the recent completion of a very imposing monument in the shape of a statue or group of sculpture in their principal thoroughfare, dedicated to

a great Irishman, and remarkable as not having been assisted in any way from its inception to its completion by any patronage of the wealthy or distinguished in the land, but as being a spontaneous and lasting memento of a people's regard for the man who, by the efforts of his life and his example since his death, had done more than any one to secure the religious and civil rights of his countrymen, and to lay the firm and stable foundations of the liberties of the Irish people. Need he say that he referred to the noble statue of Daniel O'Connell? It worthily represented Ireland's greatest patriot, while it was the work of Ireland's greatest sculptor. The second matter to which he referred was still in an embryo state. The national museum and library were still in the future; but it was most satisfactory to know that the competitive selected designs were in a very forward state. It was matter of congratulation that the Irish architects who competed had come out of the struggle in such a way that a majority of the five selected designs belonged to them; and he might say without betraying confidence that the three or four designs of next rank were also by Irish architects, and were only not placed on account of some arrangements in which the first five were considered to excel, and not on account of any deficiency in artistic merit. He thought that, whichever design should be finally decided on, they would be sure to obtain for Dublin such structures as would fulfil every requirement. The late Lord Frederick Cavendish was one of the foremost promoters of the scheme. In the Royal Hibernian Academy's Exhibition of this year they had perhaps a better array of specimens of the best art of the sister country than they had ever had before. Sir Frederick Leighton had sent them one of his most important delineations of the human form, remarkable because studies of the nude on that scale were not so common in these islands as in France, where special prizes were offered for this class of subject. "Honi soit qui mal y pense." Then there were works of Millais, who had been called the modern Titian, which should be observed carefully. There was one thing to which, taking the ungrateful position of the "candid friend," he must allude. Painters made, perhaps, in their young days a certain number of very careful studies from nature, and these studies were full of merit. But they were often imbued with the idea that, once having gone to nature for their models, they were able to go on copying and reproducing these original studies over and over again, probably transposing and altering them to gain variety. But, unless the artist returned to nature, each succeeding reproduction became further and further from the truth, the painter's art degenerated into mere mannerism, and his pictures lost that stamp of the real which nothing but the faithful study of nature could give. He saw signs of this practice here, and he believed that it had been remarked the Irish school of painters could only become worthy to take a good place amongst the art schools of the world by the most rigid adherence to the recognised canons of art and by the closest fidelity to the works of nature. Let students of painting, as well as of sculpture, keep their most earnest attention fixed on the first and most important principles, and then, and then only, would success be sure to crown their efforts. Correct and faultless precision in drawing was the first essential; without that colour was but secondary. No artist had stood in the first rank whose drawing was not correct.

The Secretary read the twenty-fifth annual report of the Art Union, which stated that during the year 496 guinea tickets and 348 five-shilling, or single shares, had been sold. The committee had been able to allocate 460*l.* in prizes. During the year 354 new subscribers had been registered.

### SOCIETY OF CARPENTERS AND JOINERS.

THE twenty-fourth annual report of the Amalgamated Society of Carpenters and Joiners has been issued. It extends from December 1882 to December 1883. The general secretary expresses the pleasure he feels at the marked success which has attended the society's operations during the past year. Despite the continued depression of trade, 1883 will rank amongst the most successful years in the Society's history. During the year there have been opened twenty-two new branches—namely, nine in England, one in Ireland, three in Scotland, two in the United States, one in Canada, and six in Australia. The Brampton (Canada) branch forwarded no report for 1882, and has been struck out of the list of branches, leaving a net gain of twenty-one. The total number is 397, and they are distributed as follows:—322 in England, 18 in Ireland, 14 in Scotland, 17 in the United States, 5 in Canada, 8 in New Zealand, 11 in Australia, and 2 in South Africa. There have been admitted 3,847, and excluded 1,402 members, which, after allowing for deaths, &c., leaves an increase of 2,217, and a total strength of 22,837. This increase is quite exceptional, being larger than in any year except those of 1865 and 1866. The net income for the year was 54,639*l.* 14*s.* 8½*d.*, an increase of 5,076*l.* 6*s.* 1½*d.* on the previous year. The expenditure, 45,159*l.* 16*s.* 3*d.*, or 9,479*l.* 18*s.* 5½*d.* less than the income, thus increasing the cash balance by that amount, the greatest increase in any year since 1876. The usual careful valuation of

the building and other property of the society has been made, and the total is 61,617*l.* 18*s.* 11½*d.*, or 2*l.* 13*s.* 11½*d.* per member. Since the formation of the society, a period of twenty-four years, the average membership has been 11,088, and the total amount expended in the benefits enumerated above is 451,838*l.*, or 40*l.* 14*s.* 11½*d.* per member. There has been a rapid increase of the society in the United States and the British colonies. Four years ago they had only 726 members in these parts, which have now increased to 2,000. The number of members connected with the various branches in the north of England is as follows:—Barnsley, 46; Beverley, 21; Bradford, 152; Bridlington Quay, 15; Carlisle, 42; Darlington, 60; Dewsbury, 21; Doncaster, 65; Durham, 32; Gateshead-on-Tyne, 75; Goole, 7; Grimsby, 28; Halifax, 82; Hartlepool, 40; Harrogate, 10; Hebburn Quay, 87; Huddersfield, 64; Hull, 442; Ilkley, 7; Jarrow-on-Tyne, 124; Keighley, 17; Leeds, 248; Lancaster, 26; Leicester, 235; Liverpool, 476; Lincoln, 56; Manchester, 830; Middlesbrough, 126; Newcastle, 361; North Shields, 110; Nottingham, 676; Rochdale, 115; Scarborough, 130; Sheffield, 222; Shipley, 20; South Shields, 270; Sowerby Bridge, 20; Stockton-on-Tees, 101; Sunderland, 408; Wakefield, 30; Walker-on-Tyne, 157; West Hartlepool, 135; Whitby, 33; and York, 146.

### LABOURERS' DWELLINGS.\*

ONE of the most important points upon which correct information is essential before building workmen's dwellings, is that of the outlay which will be required. And here it may be stated positively, on the experience of many buildings erected during the last fifteen years, that there is no insurmountable financial difficulty. The rental received from the labourer will pay a fair percentage upon the outlay necessary to provide him with the amount of accommodation to which he is accustomed. The first cost of building labourers' dwellings in blocks in London may be taken at between 7*d.* and 8*d.* per cube foot for all expenses except land, and the cost per room, including share of staircase, laundry, sanitary arrangements, &c., would be a little under 60*l.* The rooms can be let at an average of 2*s.* 9*d.* per week. We have then the following estimate of outlay, and of annual receipts and expenditure per room. The first cost, exclusive of land, is, as above stated, 60*l.* The annual receipts will be 7*l.* 3*s.*, allowance being made for repairs and loss of rent by vacant rooms in the estimate for annual expenditure, which will consist of these five items:—

(1) Dividend on first outlay, at 5 per cent. . . . .	£3 0 0
(2) Rates, taxes, and insurance, 25 per cent. on net receipts . . . . .	1 10 9
(3) Collections at 5 per cent. on net receipts . . . . .	0 6 3
(4) Ground rent . . . . .	0 18 0
(5) Balance for repairs and loss of rent . . . . .	1 8 0
Total . . . . .	£7 3 0

The form of the building being necessarily a block, the grouping of the rooms, the access to them, and the sanitary and other arrangements have to be considered. While a certain number of single rooms are provided, it is by no means intended that families should continue to live in one room, unless absolutely compelled to do so by lack of means. Many are now living in one room that could and ought to occupy two or three. The rooms should therefore be so grouped together and connected by entrances that, while they are independent of each other and can be let singly to separate families, they can also, without any alteration, be let in pairs, or three or four together. When refining and civilising influences have been brought to bear upon them for a time, they often find that they can afford two. A certain proportion of two-roomed tenements should be provided. When the necessary height has been given to a room, the larger the floor space that can be secured, the better. If a room is to be 12 feet by 12 feet by 8 feet 6 inches, it is better to make the floor 12 feet by 12 feet than 12 feet by 8 feet 6 inches, the cubic content being the same in both cases.

The single-room tenement should contain a good and strong cooking-range, with oven, but without boiler, a coal locker so arranged as to serve for a seat, and a cupboard to contain food and crockery. In planning the room, a comfortable corner should be reserved for the bed, with which neither window, door, nor fireplace must interfere. A broad window-sill for window gardening is desirable, and the door of each single-room tenement should open to the external air to avoid the possibility of infection being conveyed from room to room. The balcony offers an advantageous mode of access to the one-room tenement, and should be reached by a broad, stone staircase, open to the air. The staircase is apt to present great difficulties in management, if not very carefully considered. One of the great objections to converting an ordinary house into a tenement house is, that the front door being left open at night to suit the late hours of some

\* From a paper by Mr. Elijah Hoole, architect, read at a meeting of the Society of Arts on April 2.

of the tenants, leaves the staircase accessible to tramps and others. They enter the passages and sleep on the stairs of these houses, and by their vile behaviour contribute greatly to degrade the inhabitants. If the staircase is of stone open to the air and rain, well lighted both by day and night, and overlooked by the superintendent's rooms, it cannot thus be misused. No other kind of staircase is admissible, and the fewer of these the better for cleaning and management, it being better to increase the size than the number. Outside the one-room tenement, and at a little distance from it on the same floor, or on the half-landing above or below, should be the pail service, where water can be drawn not from a cistern where it has been standing for days, but direct from the main. A sink stone in the floor will take any water spilt in drawing, and will also take the waste which it is important should be emptied away over a sink stone, and should pass through small perforations before entering the drain, so as to separate from it the flannels, soap, scrubbing-brushes, and other things left forgotten in the pail, and, sometimes when precautions are omitted, introduced with disastrous effect into the drain. The arrangements connected with the water supply and drainage are by far the most difficult to manage, and give more trouble than any other. This trouble is increased by the regulations of the water companies, whose waste-preventing arrangements are frequently waste-producers from their liability to get out of order. The screw-down valve is a fruitful source of waste, as people will not take the time and trouble to close it completely. For the common laundry, the use of a copper for part of a day each week is assigned to each tenant of a single room, who also has access to a drying ground, upon the flat roof of the block. Separate sanitary arrangements cannot be given to each single-room tenement, but are assigned to every two or three tenements, and are kept under lock and key. The simpler and stronger these arrangements are the better. Iron traps and iron pipes, jointed with red lead, are found to answer best. Lead is quite inadmissible, being easily damaged or stolen, besides being more costly. The drainage should be by glazed stoneware pipes, laid in straight lines and with good fall, manholes being substituted for bends and junctions, and ample means of examination and clearing being provided. Thorough ventilation of the drains and their complete isolation from the sewer is, of course, essential. A large dust-shoot, with an opening on each floor, should receive the ashes and refuse. Ventilating appliances must be provided to each room, and should be out of sight, or they will certainly be stuffed up and closed. An inlet for fresh air, without draught, can often be made over the architrave of the door. A small slot-hole, cut in the meeting-rails of the window-sashes, is inexpensive and very useful, as it gives an upward current of air without draught, and imperceptibly changes the air of the room. It is also not easy to close up.

Repairs require a large expenditure when old tenement houses have to be maintained and managed. This arises from two causes: one that the labourer and his family are not very careful of their dwelling, the other that old tenement houses are often all but falling to pieces. The labourer is rough and strong, and requires surroundings not easily damaged. He usually knows good work when he sees it, and he despises, and is, therefore, not careful of the miserable building in which he is compelled to live. Besides this, the materials, even if good, and the mode of construction of an ordinary dwelling-house, even before it has become so old as to have descended to the condition of a tenement house, are unsuitable in the highest degree. For instance, instead of the rooms being enclosed by brick walls able to resist a considerable amount of wear and tear without injury, the rooms in which the labourer and his family are usually lodged are enclosed with lath and plaster. This, when new, is very tender and easily damaged, but when in the state in which we usually find it, having lost its precarious hold upon the slight laths, it is only held together by the layers of paper with which the walls are covered. The least touch causes this plaster to fall, and when once a hole is broken into it, the damage spreads with great rapidity, and in repairing it, it is difficult to know where to stop. Not only are the walls and ceiling in a condition very liable to damage, even when most carefully used, but the floor is usually worn so very thin in places that the legs of the furniture, and even the feet of the family, unexpectedly break through. Every other part of the room, the door, the window, and the fireplace, has long ago been worn out, and should have been replaced. Gradually all parts of the building, except the foundations and the lower parts of the wall, have to be renewed. This process of rebuilding, bit by bit, is misnamed repair, and is supposed to be due to the destructiveness of the labourer. The fact is that the labourer is compelled, by necessity, to live in a house which is in such a state of decay that every other tenant has left it. His house is dilapidated, not because he has destroyed it, but because he cannot find a house to live in which is not in a state of dilapidation, and cannot compel his landlord to repair it. Vigorous action on the part of the sanitary authorities might easily prevent this. They have hitherto been far too chary in condemning premises unfit for human habitation.

**A Conservative Club** is to be erected in Rochester, on the site of the old Theatre Royal.

#### The Fire at Hope Hospital, Salford.

SIR,—I am requested by the committee of the Salford Union Infirmary to forward to you, for the information of the public, an explanation of certain matters incidental to the serious fire which occurred on Saturday.

At a special meeting held yesterday the committee, after previous individual and personal inspection of what remains of "Pavilion B," conferred with Mr. Willis, the superintendent of the Salford Fire Brigade, and myself, as to the immediate cause of the misfortune.

Mr. Willis had made an independent investigation before we met, and we had both arrived at the same conclusion.

The roof of the pavilion having been completely destroyed, the walls and chimney-stacks are left absolutely bare, and in a condition most favourable to a critical examination.

No timber of any kind has been built in or into the flues or fireplaces; but, on the contrary, there is abundant evidence of the extreme care that has been exercised to avoid such dangerous construction by the introduction of cast-iron brackets built into the walls of the flues, and backed up with brickwork, to carry such timbers as would otherwise have had to be built into the walls, and thus have their ends exposed to the action of the heat or fire inseparable from the interior of a smoke-flue.

Those iron brackets still remain intact in their original position; and in other portions of the building, which before the fire were screened from observation by the plastered ceilings, the brick corbelling from the chimney-stacks, specially prepared to receive purlins and other timbers which would otherwise have had to go into the walls of the chimneys for their necessary support, are evidence of the careful manner in which it has been sought to avoid the possibility of ignition.

The "structural defect" which caused the fire is the result of imperfect workmanship on the part of some individual bricksetter, who has left a small aperture in the wall surrounding and forming the flue from the fireplace, in the ward situate between that on the ground-floor level and that on the top storey.

A fire in that particular chimney flue, the origin of which is unknown, but which probably consisted of burning soot, supplied all else that was wanting; and both Mr. Willis and myself are of opinion, after our observations and inquiries, that it had been making progress in the roof for some considerable time before it was observed by the inmates.

It is both curious and illustrative of the saying "nothing occurs but the unexpected," that such an aperture *could* exist only in a space of less than 6 inches in the height of the wall without its being open to permanent observation either from the inside of the ward itself—the walls of which are not plastered—or to external observation as a part of the outside chimney-stack, in which latter position it might have remained for a long time as a harmless ingredient in a defective flue.

It is not suggested that the builders or their subcontractors were interested in causing such a simple but serious neglect of ordinary care. The total cost of making a "perfect job," including materials and labour, would have been met by an additional outlay of less than a penny.

Builders and their foremen, clerks of works, and architects especially, are at the mercy, in numerous details, of the most ill-conditioned workman who can handle a trowel.

After theories of construction have been anxiously thought out, and have been provided and explained for his guidance, aided by active and efficient supervision, the building operative must necessarily have some personal responsibility delegated to him.

In this particular instance there was nothing to be done that was in any way exceptional. The aperture, from its peculiar position, would probably be very soon screened by other work from the observation of the several foremen and the clerk of works, the latter of whom was constantly engaged in superintending the building operations; and it is but fair to them to observe that in a structure of more than a mile in circumference, other matters might be considered as more in need of their attention than preventing a bricklayer from leaving a flue with a hole in the side of it communicating directly with the interior of the roof.

It is of course impossible to identify the culprit amongst the numerous artisans who were engaged on the works, but if this communication should come under his observation or that of his fellow-workmen, it is hoped that the fact of the fearful jeopardy in which the lives of many of their less fortunate fellow-creatures have been placed by one act of uninspired carelessness, may have the effect of making them realise a keener sense of the responsibility they assume for the faithful discharge of their duties, not only to their employers, but to the community.

The results of such a serious conflagration in the centre of a large institution have demonstrated the wisdom of adopting the pavilion principle in its construction, supplemented by fire-proof corridors, gangways, and staircases.

It ought to be mentioned, in correction of sundry reports, that there was no panic among the patients. On the contrary, their behaviour was most commendable.

The calm, systematic, and energetic conduct of the several officials and others was warmly recognised at the meeting of the committee yesterday.

No "old woman has died of fright," and the one feature in this unfortunate occurrence on which all persons are to be congratulated, is the fact that it has not resulted in a single accident to life or limb.

28 Faulkner Street, Manchester :  
April 1, 1884.

Yours faithfully,  
L. BOOTH, Architect.

## LEGAL.

**Court of Appeal.—March 31.**

(Before the MASTER OF THE ROLLS and Lords Justices  
BAGGALLAY and LINDLEY.)

WHALLEY v. LANCASHIRE AND YORKSHIRE RAILWAY COMPANY.

This was an appeal on the part of the defendants. In August 1881 there was an unexampled downpour of rain, which reached such a height as to threaten the existence of the embankment of the defendants' railway between Liverpool and Southport, and in order to save it the company's servants cut openings in the embankment, thus letting the water escape on to the land owned by the plaintiff, Mr. Whalley. Mr. Justice Day gave judgment for the plaintiff. From this decision the defendants now appealed.

The Master of the Rolls, in giving judgment, said that the defendants were the owners of a railway standing upon an embankment, and they had been authorised by their Act of Parliament to exercise all the rights of a railway company. The embankment in question stood upon sloping ground, one portion of the land being higher than the other. An extraordinary storm of water arose by which the length of the upper side of the embankment was flooded, and the body of water rested in force against the embankment. In order to secure the safety of the embankment, the servants of the owners of the embankment cut drains or trenches throughout it, and by reason of this the water passed through the openings on the plaintiff's land, doing it damage. The question was whether the defendants were liable for the damage caused to plaintiff's land through the water passing on to it sooner than by percolation it otherwise would. The jury found that more damage had been done than if the water had been allowed to percolate through; but the jury also found that what the defendants did was reasonable for the preservation of their property; and the question arose whether under the extraordinary circumstances the defendants were liable. Were they bound to take active steps in order to save their own property, the necessary effect of which was to injure the property of their neighbours? In doing something to cure the material defect of a main land he had no right to transfer that defect to his neighbour. If he did so, he must pay for it; and in this case the defendants could not plead the ordinary use of their railway, as then sparks from their engines might set fire to a person's property near their railway. He therefore thought that the defendant company was liable in this case, and that the judgment of Mr. Justice Day for the plaintiff ought to be upheld, and the appeal dismissed with costs.

Lords Justices Baggallay and Lindley concurred.

## CHURCH BUILDING AND RESTORATION.

**Perth.**—The memorial-stone of a new church, being erected in Marshall Place, Perth, for Free St. Leonard's, has been laid. The style of the church is the later Scottish Gothic, founded on old examples. The length of the church will be about 70 feet, and accommodation will be provided for about 1,000 sitters. The church is built of Polmaise stone, and is expected to cost fully 11,000*l.* The architect is Mr. J. J. Stevenson, London.

**Morpeth.**—A Wesleyan chapel, erected in Manchester Street, has been opened. The building occupies the site of the former chapel and of a caretaker's house which adjoined it. The ground slopes rapidly from front to back, and advantage has been taken of this to obtain a school-room 36 feet by 23 feet, together with a large vestry and class room. The chapel is seated for 360 persons. The contractor for the work was Mr. D. M. Spence, Amble, and the architects were Messrs. S. Oswald & Son, Newcastle-on-Tyne.

**Aldham.**—The church of Aldham has been lately restored, the previous state of the building being very rotten and dangerous. Among the work carried out the south wall has been entirely taken down, the old foundations dug out, new foundations laid, and the wall rebuilt. The north wall has been repaired, those portions which were found to be rotten having been removed and replaced by new work. A handsome chancel arch, with north and south

buttresses, has been erected. The stonework of the windows on the south side of the nave is new, as also the stonework of the south doorway. The north windows have been thoroughly repaired, and fitted with new lead-work and glass. Nearly two-thirds of the tower have been taken down and rebuilt, and the tower is now surmounted by a spire. The restoration has been carried out by Mr. W. Everett, builder, of Hadleigh, under the direction of Mr. W. M. Fawcett, F.S.A., of Cambridge, diocesan surveyor. The porch is to be built forthwith, and windows and louvres put in the tower.

## SCHOOL BUILDINGS.

**Earlestown.**—A lecture-hall and Sunday-schools are about to be built in connection with the Primitive Methodist Chapel, Earlestown, near Warrington. The buildings will comprise a hall capable of seating 500 adult persons, five class-rooms for 20 scholars each, an infants' room for 60 infants, and a library. Separate yards and offices will be provided for boys and girls respectively. The plans have been prepared by Messrs. Maxwell, Tuke & Hurst, architects, Southport, and the works will be carried out under their superintendence.

**Great Broughton.**—The memorial-stone of a Wesleyan chapel has been laid. The style chosen is Gothic, and the materials are Brigham white stone with hewn work of Aspatria red stone. A Sunday-school at the side, and attached, forms part of the building, and is of the same style of architecture. There are also two vestries, and the whole is to be heated by Grundy's heating apparatus. The architects are Messrs. C. Eaglesfield & Son, Maryport, and the contractors are as follows:—Masonry, Mr. A. Mackenzie, Maryport; joiner-work, Mr. P. Robinson, Cockermouth; and slating, plumbing, and glazing, Mr. T. Mandale, Maryport.

## GENERAL.

**Lord Carnarvon**, at the request and on behalf of the Prince of Wales, will perform the ceremony of laying the foundation-stone of Peterborough Cathedral, assisted by Lord Lathom.

**Mr. T. S. Worthington** read a paper on "Decoration" at the meeting of the York Arts Guild on Thursday in last week.

**The Exhibition at Bradford**, opened by the Prince of Wales last year, in connection with the Technical School, has resulted in a net profit of nearly 7,000*l.*

**The Bay** of the Bishop's Cloister at Hereford Cathedral nearest the grave of the Hon. Mrs. Herbert, wife of the dean, is to be restored under the direction of Mr. J. O. Scott, as a memorial of that lady.

**A Design** by Messrs. Heaton, Butler & Bayne has been adopted for the stained glass window which is to be erected in Northampton, as a memorial of Mr. Peirce.

**The Bradford Technical College** has cost 29,880*l.* As the annual expenditure is about 4,100*l.*, it is expected that for the next two or three years there will be a deficiency of about 1,000*l.* in the income.

**Messrs. Oliver & Leeson**, of Newcastle-on-Tyne, have obtained the first place in the competition for the new church at Wallsend. Mr. Pearson, R.A., was assessor. It is expected that the works will be shortly commenced.

**Messrs. Nelson & Brooking**, architects, of Barnet, have dissolved partnership.

**Mr. H. Marsden**, of Louth, has been appointed surveyor to the Commissioners of Sewers for the Wapentakes of Louth Esk and Ludboro', in place of Mr. J. Maughan, resigned.

**The Liverpool Cathedral Committee**, on Tuesday, decided by 41 votes to 30 that the site of the new cathedral shall be on St. John's Churchyard.

**Mr. A. Carnegie**, of New York, has given a further sum of 1,000*l.* for the erection of a gallery in the Carnegie Baths, Dunfermline.

**Messrs. Craven, Dunnill & Co., Limited**, Jackfield Works, near Ironbridge, Shropshire, have been awarded at the Calcutta Exhibition two medals and two certificates, for the excellence of their productions in enamelled, encaustic, and decorative artistic tiles.

**The Pulsometer Engineering Company, Limited**, Nine Elms Ironworks, have, in addition to two other awards, received a gold medal at Calcutta for their patent direct-acting Deane pump.

**The Masonry Work** of the railway bridge over the Save, between Belgrade and Semlin, is nearly completed. The work of raising the embankment between the banks of the Save and the railway station has been begun. In January last the Government paid to the company 2,137,669 frs. for work done.

# SUPPLEMENT

TO THE

# ARCHITECT

LONDON, APRIL 5, 1884.

## THE BUILDING TRADES EXHIBITION AT THE AGRICULTURAL HALL.

CLARKE. The exhibition closes this evening at ten o'clock.

### Messrs. Hodgkinson & Clarke.

The home educational seat and desk, one of the arrivals in question, is not only ingeniously constructed, but all the harsh lines and stern-looking features that cling to the old school-desk are eradicated, and the appliance is made attractive to the child instead of, so to speak, repulsive. Every mother will, we are sure, be charmed with it. Its main advantages are that it can be made to suit children varying from six to sixteen years by a simple arrangement that enables seat or desk to be raised or lowered, and drawn apart to make more room between the two. Thus one of these seats purchased for a child when young is suitable for it as long as it receives its tuition at home. But its hygienic features are more important than its economical points, and we find that it has been formed in shape to prevent the risk of curvature of the spine, compression of the chest and high shoulders, and will, we have not the slightest fear, be recommended by every medical man who sees it. The school partition, of which we have already spoken, though at the time it was not properly fixed, improves materially upon full acquaintance, and must prove a most useful feature to the hard-worked teacher. Whoever has designed these appliances have well thought out their subject.

### Messrs. Jeffrey & Co.

Messrs. JEFFREY & Co. have contributed a very fine set of specimens of interior decoration in non-arsenical wall-papers, which include both hand and machine-printed wall-papers, dado decorations, embossed leather papers (if such a term is admissible), flock papers, lacquered gold papers, and staircase decorations. Occupying the central portion of a large and lofty stand we have an Italian damask design by Mr. W. SCOTT MORTON. It is worked in different shades of flocks on a lacquered gold ground, and is adapted for large rooms when a rich effect is desired. Another specimen of this design is shown in blues, on a "talc" ground, giving it the appearance of a rich silk, and is of a *recherché* character. The "Rossetti" pattern, in tones of yellow, designed by Mr. J. D. SEDDING, will, no doubt, be admired by many. It is an exceptionally wide pattern, measuring 26 inches by 34 inches, and can be hung so that the pattern shall not repeat in lines. One of the gems of the display is, in our opinion, the "tapestry" pattern in blue and gold, having all the effect of a piece of the real material. Above these patterns, and forming a frieze, is a fine example of an embossed leather paper representing the "poppy," the design being stamped in high relief, and the flowers and leaves hand-painted. On the right-hand screen we find the "hydranga," very naturally treated in rich reds

and browns, making a warm luxurious-looking covering, and adjoining it is a filling and frieze by Mr. W. J. MUCKLEY, an attractive work, the design of the former being orange-blossom and fruit, while the frieze represents doves, owls, and foliage, with a background in gold. This has been especially designed with a view to obviate the constant repetition of the same objects in this kind of decoration. Close to this is a pretty feature from the pencil of Miss KATE FAULKNER, with a dado of iris and poppies. The left-hand corner contains a fine pattern printed in reds on a talc ground; also an example of printing in green transparent colours on a metal ground; and next to it a decoration of Italian character in flocks and lacquered gold—a rich work; and adjoining this is another rich example, a drawing-room filling in blue and gold, with a full-length of the frieze, 21 inches deep. The outside of the stand contains, amongst other specimens, a classic decoration for staircases, specially designed by Mr. OWEN W. DAVIS, particularly adapted for large staircases or public buildings, the main features being that a scroll dado can be used without the necessity of mitreing, ornamental stops being placed at the junctions. In contradistinction to this *chef-d'œuvre* is an example of a cheap machine-printed staircase decoration giving a stencilled effect. The average cost of this, we are told, would not exceed  $2\frac{1}{2}d.$  per yard, and it has an excellent effect. The remaining portions of the exhibit are chiefly composed of low-priced machine-printed papers, all, however, possessing artistic feeling in colour and design. The firm have in addition a stand in the south gallery, where other meritorious decorations are to be seen, clearly showing that need no longer exists for covering our walls with poisonous colours either in inexpensive or the most costly decorations.

### Mr. P. A. Maignen.

Mr. P. A. MAIGNEN, 22 and 23 Great Tower Street, is present with his celebrated "Filtre Rapide," which has become one of the most popular filters manufactured, and in a short space of time. Medical authorities and sanitarians generally will not give countenance to any appliance for filtering water for domestic purposes that does not take to pieces, or that the user has not complete control in connection with its working parts for the purpose of cleansing; and the more simple the arrangements, the more support it is sure to obtain. Mr. MAIGNEN has secured all these advantages, and has at the same time introduced some novel features into his invention. The filtering medium, a combination of different charcoals, is thrown into the water to be filtered, and this is drawn with the water itself to that part of the filter through which it has to pass to the filtered-water reservoir. This consists of an earthen perforated cone, covered with a cap of asbestos cloth, and to this material the whole of the charcoal clings or is deposited, forming a solid body of some thickness over its entire area. Arrangements are also made for aerating the water, by supplying it with a constant accession of purified fresh air. For water that is very hard, or that requires softening, Mr. MAIGNEN has patented a "media," called *carbo calcis*, that purifies and softens at the same time. Besides independent filters, Mr. MAIGNEN arranges his system to filter the entire house supply from the tank, and he is prepared to arrange with water companies to filter the whole of their consumption at a much less cost and to render it perfectly pure. These filters are also made in a form to suit armies on the march, and is, we believe, the only one now approved by the War Office, and was sent by the Government to the Soudan for the recent campaign.

**Messrs. Geo. Waller & Co.**

Messrs. GEO. WALLER & CO., of Holland Street and Bear Gardens, Southwark, occupy Bay 17 with a full collection of their many specialities. Penstocks, it may be presumed, are made a leading feature of, the firm having for more than forty years devoted considerable attention to them, and they claim to have the largest stock of patterns in the world of various sections ready for use. They are shown in various forms, as well as the many appliances connected with sewer requirements. There are tide-flaps and valves, flushing-valves and boxes, flood-water ventilators, stink-traps, pavement-doors and frames, and foot-irons, &c., &c., all of which the profession is fully acquainted with. The only new article to which our attention was called is a side-entrance cover for sewers, that is a decided improvement over existing arrangements. The door is formed of a double grating, the bars of the one fitting closely into the other, and on the outer or top one being raised, the inner one is lowered, offering direct access to the sewer. On entering, the workman pushes up the under one, this action bringing down the top one, which forms the perfect lid and renders the presence of an attendant in the street unnecessary. As a saving of labour this invention should commend itself to authorities.

**The Blackman Air-propeller Company.**

The Blackman Air-propeller, shown by the BLACKMAN AIR-PROPELLER COMPANY, Limited, 57 Fore Street, E.C., is attracting considerable attention. Formed as a fan with blades of peculiar shape, as our illustration shows, it can be fixed either

vertically or horizontally. According to the side that is uppermost or outward, so it extracts vitiated air or introduces fresh. As a means of propelling large bodies of air in either direction it is probably without a rival, and, according to the speed at which it is driven, so is that quantity increased or diminished. The amount of power required is very small, and would make no perceptible difference in any motor whatever work it may be doing. For mills, factories, or public buildings where a large body of people are at work or congregated, it offers the quickest means of changing the atmosphere of any appliance we are acquainted with.

**Messrs. Verity Brothers.**

In the matters of window openers, reversible sashes, casement stays, and kindred appliances, Messrs. VERITY BROTHERS, Call Lane, Leeds, deserve notice. The reversible sashes enable both top and bottom ones to be swung by means of strong swinging pivots. The top one can be opened to any required distance for ventilation by the assistance of a chain opener and fastener, and it remains secure in whatever position it is left, and for the ordinary sliding movement of the sashes a double or treble-lock fastener is provided. The chain opener and fastener is also applied to ordinary fanlights, and the *modus operandi* can be applied to windows of the heaviest calibre, and is at the same time simple and free from objectionable accessories. These appliances occupy a large portion of the exhibit. The patent casement stays for French or casement windows are of good and simple construction, rendering the opening of windows easy, and securely setting them in any desired position. There is also a wall and ceiling board cramp possessing some good points, and effecting a saving of time and labour in use.

**The Bower-Barff Rustless Iron Company.**

THE BOWER-BARFF RUSTLESS IRON COMPANY, Limited, 23 Queen Victoria Street, E.C., again exhibit a variety of specimens of ironwork, embracing a wide area as regards their uses, coated by their patent process. The object is of course to show the applicability of the system to any and everything made of iron, either cast or wrought. The advantages of the BARFF process has been so often dilated upon in the columns of *The Architect* that little remains to be said. A notable feature in the process, that possibly we may not have mentioned before, is the colour produced upon articles treated by it. Although the same in all cases, it is none the more effective in the case of ornamental work, which assumes the appearance of a dead black, similar to those coated with a Berlin black of the same shade, from which it can scarcely be distinguished.

**Messrs. Bellman & Ivey.**

Messrs. BELLMAN & IVEY, 95 Wigmore Street, W., on this occasion confined their exhibit to BELLMAN's patent stoneware gully, which was fully described in *The Architect* of August 26, 1882. As we observed on that occasion, the gully receives the rain-water directly from the roof, avoids all splashing, ventilates pipes and trap, and renders clearing a very easy matter. Since their introduction a large number have been sold, and the firm have appointed agents in various parts of the country where they can be seen and ordered. But we miss the collection of decorative substances that on previous occasions has rendered the exhibit of Messrs. BELLMAN & IVEY so attractive.

**Messrs. John G. Rollins & Co.**

An exhibit of a mixed but useful and interesting character is contributed by Messrs. JOHN G. ROLLINS & Co., Limited, Old Swan Wharf, Upper Thames Street, a firm of considerable reputation in connection with American industries. The carpenter, the householder, the agriculturist, and the hardware dealer will find plenty to interest them on this stand, and everything shown is of American manufacture and by the most popular makers. In tools we find a collection of wrenches, axes with hickory handles, cast-steel hatchets of various patterns, cast-steel hammers, a set of cross-cut saws for two men by the noted firm of "DISSTON" of Philadelphia, a similar set for one man, and a selection of cast-steel hand saws of various kinds and qualities. For the agriculturist there are a large collection of cast-steel hay, manure, and spading forks, many of these emanating from the celebrated firm of "BATCHELLER"; of American hand hay-rakes, cast-steel scythes, and scythe swaths. In the domestic department we find a number of those *bric-à-bracs* our Transatlantic friends have yclept "notions." There are butter-churns, clothes-wringers, fluting-machines, folding tables and chairs, blind furniture, &c., garden tools, and the popular archimedean lawn-mower, for which a most extensive sale has accrued in England. We shall not attempt to enter into a criticism of American *versus* English tools, as it is a subject that has been amply discussed elsewhere; all we shall remark is, that in selecting makers who stand at the head of their various industries in the States, Messrs. ROLLINS introduce us to the best class of American manufactured goods. That many of them have an extensive sale here as well as in our own colonies, sales that are repeated year by year, is the best reply that can be given to any that doubt their quality, and so far as finish and general appearance go they seem to leave little room for objection. Besides the goods we have mentioned, there are some ingenious specimens of baby carriages, made by the American Baby Carriage Company.

**The Patent Victoria Stone Company.**

THE PATENT VICTORIA STONE COMPANY, 283A Kingsland Road, are showing this concrete material in its varied applications for building purposes, paving, &c. The attention we have before now drawn to it, and the practical tests it has been put to, leave but little room for us to say more in its favour. Its merits, too, from an economical standpoint, are also of no mean order, for the saving of time in laying paving, platforms, &c., in slabs of this material instead of natural stone is very great, while its cost is also much less than the latter. For architectural dressings it is also now very extensively used, and likely to be so, as long as it is turned out in such a praiseworthy manner as are the vases, pedestals, pilaster bases, steps, window-heads, &c., now being shown at the Company's stand.

**Messrs. Wm. Udal & Co.**

Messrs. WM. UDAL & Co., the old-established brass-founders of Bromsgrove Street, Birmingham, and Charter-House Street, London, have an excellent collection of builders' and cabinet brassfoundry, both cast and stamped, ship, window, and stable fittings, and an array of cabinet handles in Mediæval, Queen Anne, Chippendale, and other styles. The collection of door furniture is of an exhaustive character, the designs embodying all those now in vogue, and made in wood, china, enamel, brass, and glass. Fire-dogs and brasses of artistic merit also form a conspicuous feature in the exhibit. In addition to these there is one article that attracts considerable attention. This is BRUCE's patent fanlight opener, of which the firm are patentees and manufacturers. Substantially made in brass, it is a simple and effective apparatus, actuated entirely by levers, one determining the movement of the whole, and the window can be lifted at any angle by simply turning a thumb-screw. It is adapted to any kind of light, including ship ports, or for opening and closing doors, and it can be also arranged to open any number of lights at the same time that may be moving in opposite directions. It can also be adapted to dome top fanlights, the only additional means here used being a cogged quadrant and rack. They are made in different sizes according to the size and weight of the work to be effected, and the working space only requires from 1 to 1½ inches to move in, and it would be difficult to say too much in its favour.

**Messrs. Salmon, Barnes & Co.**

Messrs. SALMON, BARNES & Co., The Canal Head Foundry and Engineering Works, Ulverston, confine their exhibit as last year to two specimens of their revolving shutters, hand-power lift, and their patent bench knives. One of the examples of shutters is actuated by their patent balance weight motion, which is specially adapted for heavy shutters, the moving being so much more easily effected, and the mechanism so simple that nothing is employed that can easily be put out of order. For those who prefer the spring motion, a curvilinear shutter is shown, worked by their improved action. The hand-lift exhibited is made on the patented principle adopted by the firm. It is of simple construction, the lifting and lowering being performed by an endless rope, without a hand-brake. Toothed wheels in the gearing are altogether dispensed with, and the brake is always in gear, that is to say, to whatever point the cage is drawn to there it remains, if the rope is let go, and the heavier the load the greater the grip upon the gearing. The cage rope wheel is turned, and of large diameter, to prevent the fraying of the rope. For facility of fixing and general advantages, the lifts made upon this principle are doubtless worthy of taking rank amongst the very best in the market. It is almost needless to add that the firm manufacture them for all purposes, and to work by steam-power and hydraulics as well as by hand.

**Messrs. Ewart & Son.**

One of the most attractive exhibits in the building is that of Messrs. EWART & SON, 346 Euston Road, N.W. A somewhat massive structure, covered entirely with zinc, introduce us to the many uses to which this useful metal is applied. We see it here in its simplest and most elaborate form, as adapted to decoration and many of the domestic articles into which it is wrought. But it is in its application to building purposes that our readers will feel the greatest interest. There are bold and handsome dormers, finials, mouldings, crestings, ornaments for curbs, mansard roofs, &c. The roofing intended to take the place of our slates and tiles is a "new departure" to English notions. We well know that in America metallic tiles are largely used, and attempts have been made to introduce them here, at present with but scant success, but these tiles are mostly made of tin, though well protected with metallic paints, and their advantages as to weight, ease of laying, &c., have been often urged. On the other hand, it has been said that the sulphurous acids always present in the atmosphere of our large towns would have an injurious effect upon them, even with the protection named. We have not decided the question yet, but we are using zinc roofing for turrets and other ornamental additions to many of our best mansions, so far apparently with success. Should a more lengthened experience assert advantages in metallic roofing over that of the more cumbersome tile or slate, a revolution will be created in two im-

portant industries that at the present moment has scarcely been taken into serious consideration by the makers of the orthodox appliances.

**Mr. Charles Gay Roberts.**

The rain-water separators, exhibited by Mr. CHARLES GAY ROBERTS, of Haslemere, Surrey, and which have been improved and made in other forms since their first appearance, are ingenious contrivances, and well worthy the attention of both town and country residents. They occupy but little space, are fixed on the wall of the house in connection with the overflow pipes from the roof, and are made to suit either a country or town house. When we consider the quantity of rain-water that is annually allowed to run to waste, the question arises, Is this a necessity, and could not more of it be utilised for domestic purposes than is now the case? The system adopted in many districts of catching the rain-water in a tank and using it for washing, &c., is objectionable, because it contains all the impurities that are collected on the house-tops and gutters, making it often extremely offensive; but with an appliance that collects only the purer portion of it, all objections cease, and it becomes at once available for all domestic purposes, even (after filtration) for drinking, and in many country districts in particular this would be considered a great

boon, clean rain-water when filtered being preferred by many persons to spring-water. Simply told, the separator is a comparatively small tank with two compartments, one of which is made to cant over at a given time. When a storm first arises the rain washes the roof and gutters of all dirt and other matter that may have collected, and by the arrangement of the separator all this impure water passes in the usual manner to the drain, but after a time, sufficient to have allowed the impurities to pass away, the water in the first compartment rises and flows into the second through two small holes; but to make assurance doubly sure, in other words, to give every facility for the slightest impurity to escape, a portion of the water also passes away through a hole in the bottom. In time, however, the water preponderates and the second compartment fills, and on reaching a certain level, this cants over, and by means of a discharge-pipe empties itself into the storage tank. There are other features in connection with the continued action of this appliance under varying conditions of storm that can be best understood by an examination of the separator, or by consulting the illustrated prospectus of the patentee; but enough has been said to show that the invention is of a most useful character.

**Messrs. J. L. Bacon & Co.**

Messrs. J. L. BACON & Co., of 34 Upper Gloucester Place, W., and at Glasgow, Dublin, and Belfast, show their system of heating and ventilating, and also a variety of cast-iron ornamental coil cases and floor and skirting gratings. Many of these are of very elegant design, and can be obtained solely from this firm. But it is their system of heating that we would specially draw attention to, and in doing so must first mention that Messrs. BACON & Co. are well known as having originally introduced a tube of superior quality, and of a small and particular diameter for this purpose. Amongst the advantages of the apparatus are that it is equally applicable to old or new constructions, and from the facility with which the tubes can be bent can be introduced without disturbance to existing arrangements. The action of the apparatus being that of the simple circulation of liquid induced by lighting the furnace fire, all the difficulties arising from condensation, air stoppage, and the consequent necessity for attention to valves and air-cocks are avoided. The whole apparatus when erected is tested by hydraulic means to a pressure of 130 atmospheres, and since the valve is regulated to blow off at six atmospheres, it is manifest that leaks are of rare occurrence. The inconvenience of maintaining fires during excessive cold, to prevent the water in the pipes from freezing, has now been overcome, by mixing with the water a patent non-freezing solution, which, once in the tubes, serves for an indefinite period, as it neither decomposes, precipitates, nor evaporates under the action either of heat or cold.

**The Albion Concrete Company.**

Mr. CHARLES LUMLEY, manager of the ALBION CONCRETE COMPANY, of Haymerle Road, Peckham, S.E., who appeared for the first time at last year's exhibition, is again present. Then the stand was in the arcade; this year it occupies a more prominent, or, at least a more attractive, position at Bay 4 inside the hall; and the reappearance of the Company confirms the opinion we expressed upon referring to their exhibit on that occasion. The articles shown comprise various specimens of string-courses, cornices, columns, and architectural concrete dressings in general, both in buff and red. All the work is exceptionally well turned out; the aris is so sharp and clean, and the section of the mouldings so uniform, that the ordinary observer would fail to detect the difference between it and well-cut natural stone. This is the more noteworthy from the fact that none of it has been got up merely for show, but is all on order for different buildings, and is on the way to its respective destinations. Of the buff colour, a portion of the dressings for Mill's Hotel, St. George's Road—C. H. FLACK, Esq., being the architect—consisting of a very effective and bold design of a bay window, calls for special attention. Of the buildings for which they have the red colour on hand may be mentioned Madame TUSSAUD's new galleries in the Marylebone Road—F. W. HUNT, Esq., architect; Messrs. LEIGHTON BROTHERS' new premises, Drury Lane—Messrs. LAUDER & BEDELLS, architects; and business premises in the Walworth Road, also by Messrs. LAUDER & BEDELLS.

**Mr. S. Ransom.**

Mr. S. RANSOM, Epoch Saw Mills, Kensal Road, W., staircase and hand-rail manufacturer, is showing at Stand 277 specimens of his craft that are worth particular notice, and do him great credit. The exhibit comprises a very varied collection of hand-rails, carved scrolls, newels, and balusters in oak, mahogany, walnut, and pitch pine, the designs of which are very effective, and the workmanship all that can be desired. The principal portion of the stand is taken up with two full-sized flights of stairs leading to one landing, the sections of which are executed in different styles. One of these in oak, with ornamental bracketed string and bold curtail steps, is very effective; and above, the moulded mahogany hand-rail, terminating with carved scroll, displays some choice work and richly-grained wood, and the turned mahogany newel supporting it is of equal merit. Another that struck us as being very unique is a dogleg in pitch pine, with bold curved steps, and the variously-designed newels are panelled with different woods; the hand-rails are in oak and walnut, as also are the balusters, and the patterns of the latter are original and striking. Two well-designed models of complete staircases, the one a dogleg, the other a spiral, complete this interesting exhibit, and are marvels of skilful workmanship.

**Messrs. H. Thompson & Co.**

Messrs. H. THOMPSON & Co., Morrow Street, Walworth Road, have a very good collection of paints, &c., their leading and in fact principal feature being a magnetic oxide of iron paint, for which they claim certain advantages. Freedom from acids, anti-corrosive, unadulteration, good body and covering power, and special preservative properties, are the leading points. It is said to have a great affinity for iron, to which its particles adhere with tenacity; at the same time it is equally applicable to wood, on which it forms a complete coating of magnetic oxide of iron. The firm have also a collection of boiler enamel paints, anti-fouling composition, &c.

**Messrs. Hayward & Eckstein.**

The stand of Messrs. HAYWARD & ECKSTEIN, of Union Street, Borough, fitted up with the several examples of their semi-prismatic pavement and other lights, appears to attract as much attention as ever. It would be presumption to attempt to discuss the advantages of daylight over gaslight as so much has been written of late years upon the question, and it is very palpable that if all our underground places can be lighted by such means as HAYWARD & ECKSTEIN's prismatic lights, the thousands of individuals employed in basements day after day the year round will not only benefit in health, which in its turn buoys up the spirits, and assists in producing a better feeling of contentment, but a heavy sum is annually saved to employers, and danger from explosion or fire rendered nil. To those unacquainted with the particular section of these prisms, we may say that the lenses are so arranged that the light may be thrown forward in one direction. One side is nearly upright, and the other formed at such an angle that the light passing through the upper surface strikes the inclined side and is reflected completely within the lens, and issues from the upright side in the required direction. As a further assistance, and should there be any very dark positions, where the floor lights would not have the opportunity of collecting sufficient light from above, the firm manufacture a lens light with a silvered reflector under, arranged to raise or fall, so as to divert the rays to any required part of the basement. Amongst the recent orders executed by the firm for these "daylight" producers has been the First Avenue Hotel, Holborn, Messrs. HOLLAND BROS., Oxford Street, Messrs. FOSTER, PORTER & Co.'s new premises in Wood Street, and they are now laying down from 1,500 to 2,000 feet in some new erections in Chancery Lane. The firm have found it necessary to caution the public against an infringement of their patent, by calling attention to a recent decision of the judges in the Court of Appeal in the case of HAYWARD v. HAMILTON. But Messrs. HAYWARD & ECKSTEIN provide us with ventilation as well as light. They are the makers of the well-known Sheringham inlet ventilator, as illustrated, which, used in connection with

BOYLE's patent mica flap outlet, forms a simple and effectual mode of securing efficient ventilation in reception rooms, kitchens, &c.; in fact, it has been adopted by the firm with success in many buildings of considerable size. We attach a drawing of a mica inlet valve for drawing fresh air into drain or

sewer, self-acting, and closing against back-draught, which prevents the emission of foul air. These are made to fix on 3 or 4-inch pipes, and either vertical or horizontal. Another department of manufactures to which the firm devote par-

ticular attention is iron staircases. Our illustration represents a pattern that is much in request. The mode of making the tread, riser, and spandrel in one is carried out in this instance, securing great rigidity and strength. This staircase is kept in

stock in several sizes for right and left hand, enabling orders to be executed with a promptness not general with such goods. At the present time they are well employed in this branch of their manufactures, as well as in the pavement lights.

#### Messrs. Malkin, Edge & Co.

Messrs. MALKIN, EDGE & CO., Burslem, Staffordshire, are present with a choice collection of their encaustic and other tiles. The well-earned reputation of this firm is an absolute guarantee as to the quality of their productions, and in design and the correct rendering of any speciality they may introduce, they may be pronounced on a par with their most "advanced" competitors. Their pavements embrace a number of chaste designs; the blending of colour appears to have been carefully studied, and in most instances offers agreeable and effective contrast. There is an equally good assortment of printed and encaustic tiles, arranged for hearths, dados, walls, &c. Coming to those intended for grates, jambs, &c., we find an infinite variety of design and colouring, several of the new tints of neutral grade being skilfully worked in. Amongst these are hand-painted specimens of great merit, that clearly points to the capability of the firm to give true artistic effect to any subject entrusted to them to carry out.

#### Webb's Worcestershire Tileries Company, Limited.

No less interesting in this department is the display of tiles made by WEBB'S WORCESTERSHIRE TILERIES COMPANY, Limited, Worcester, who take as wide a range in their manufactures as most of their competitors. Their newest feature consists of printed underglaze hearth and other tiles, tending to make the pattern much more durable; and to give full effect to others, their stand is mainly formed to represent a piece of furniture in which many are set, the combination bringing out the salient points in each, but probably more to the advantage of the tile ornament. There are two specimens of crests of rather large size, hand-painted in full heraldic colours on white tiles, well portrayed, and that cannot fail to attract the eye of the visitor. Amongst the general collection are to be found numerous mosaic and geometrical designs, as well as encaustic tiles, and the designs are so exhaustive that the most fastidious taste should be enabled to satisfy itself. On the same stand are to be found the productions of Messrs. H. C. WEBB & Co., in their patent diachromatised wood, not only arranged for flooring but for other decorative purposes, such as panels for doors, finger plates, balusters, &c. We have so often adverted in recognition of the merit of this ingenious invention that further comment is unnecessary, except to say that time has enabled the patentees to adapt the system to many other uses than that in which it was first introduced to our notice.

#### The Chelsea Lock Co.

The CHELSEA LOCK CO., 103 Lot's Road, Chelsea, S.W., are present with their locks and latches in a variety of sizes and qualities. The patent under which they are made appears to be one of the most useful inventions hitherto introduced by lock makers. One of the defects it desires to remedy is the weakening of doors, caused by fixing a mortise lock of the ordinary type. To fix a "Chelsea" lock, the mortise is cut with a centre-bit and the sinking for the striking-plate in a similar way and with same bit, so obviating all knocking about of the door with mallet and chisel, and is so simple an operation that five minutes will see the door cut and lock inserted and fixed. The lock can be removed as simply as it is inserted, for the fixing screw is so attached to the plate that the action of unscrewing withdraws the lock, and thus prevents the injury often done to a door by prising out with a lever, &c. The fittings and finish of the locks are all that can be desired, and as they become more known must be generally specified.

#### Mr. J. M. Boekbinder.

Mr. J. M. BOEKBINDER, 49 Thornhill Road, Barnsbury, exhibits decorations in carton-pierre and fibrous plaster, and unquestionably carries the palm for this work. The designs display an amount of true artistic feeling but seldom met with, and are certainly second to none that has come under our notice, and it is gratifying to remark that less cannot be said of the finish or of the quality of material. We have here durability in combination with the beautiful. One side of the stand is in drawing-room style of the LOUIS SEIZE period, and in the centre is a finely-carved mantelpiece in pure statuary marble of equal beauty and artistic merit. It is fitted with tile grate, hearth, &c., *en suite*, the latter articles, including the mantelpiece, being contributed by Messrs. ASHTON & GREEN, whose productions of this description have often elicited such well-deserved praise. The other side of the stand is decorated in dining-room style in Flemish Renaissance, the upper part of the wall being hung with hand-painted Gobelin tapestry, also the work of Mr. BOEKBINDER, and we can fairly say of this that the artist's conception can scarcely be too much eulogised.

#### Messrs. Engert & Rolfe.

MESSRS. ENGERT & ROLFE, Barchester Street, Poplar New Town, send their usual collection of felts, which they are accustomed to supply to our own and many foreign Governments, which is perhaps the best recommendation we can accord to it. To show its power of resisting damp, a brick course is exhibited set in a cistern of water resting upon a bedding of the fibrous asphalte, which, it is said, has stood for seventeen years, the bricks being apparently perfectly dry. The other felts made by the firm are also shown, including asphalted roofing felt, and those for lining roofs, viz., inodorous bitumen felt, sarking, and hair felt, but the exhibit appears to the ordinary observer of rather an unpretending character, and scarcely of the importance its merits deserves.

#### Messrs. Martin & Co.

A very notable exhibit is that of Messrs. MARTIN & Co., wood-carvers and decorators in wood, of 27 Newman Street, W., who show a variety of specimens of machine-carving that is attracting a large number of the visitors. The firm seek to illustrate the excellent effects capable of being attained by machine-carving, and their ability to place at the command of persons of moderate means the advantages only to be indulged in by the wealthy classes. For this purpose machine-carving is exhibited in a variety of examples applied to interior decoration. Several specimens of dados are shown in light and dark oak treated in the Chippendale style, all the ornamental parts being machine-carving, and for drawing-room decoration the panels are coloured to suit the appointments of the room, the mouldings of machine-carving being gilt. A noble mantel and over-mantel, in which some fine tracery is visible, is a leading feature in the exhibit, and a bay is fitted up with dining-room appointments in dark oak, consisting of door, architrave and frieze. As compared with composite materials such as fibrous plaster, carton pierre, &c., the advantages claimed, and that are clearly visible, are the sharpness of the lines, and the non-liability to chip or break. When compared with hand-carving, the extraordinary difference in price is unmistakably apparent, and we question if it could be detected except by the most practised eye.

**Mr. James Howorth.**

Mr. JAMES HOWORTH, Victoria Works, Farnworth, near Bolton, sends specimens of his widely-known revolving archimedean screw and radial ventilator. These appliances have been in use for so many years, and have been so extensively patronised, that we must assume they are known amongst the profession generally and a large portion of the public. In looking over the list of names to whom they have been supplied we are struck by the array of names of noblemen and gentlemen to whom they have been supplied, and who have testified to their worth. They are necessarily (excepting when made of the turret form to suit the architecture of a building) similar in shape to many other revolving exhaust ventilators, but the interior of the cylinder is fitted with an archimedean screw, which is attached by a spindle to the revolving hood, that has a series of side valves very closely connected, through which the hot or vitiated air escapes and prevents rain or snow entering. By this means the archimedean screw rotates with the head, causing a continuous strong up current, at the same time arresting the admission of cold air or a down draught. The centres are most delicately poised, and revolve on an imperishable substance, and the arrangement for lubricating is so perfect, that they have been known to work for many years without the slightest attention, the slightest breath of wind being sufficient to turn them, and without noise. Mr. HOWORTH has recently introduced a new pattern with a radial screw, intended to work by power, of which we give an illustration. Situated in the heart of the Lancashire textile in-

dustries, with Yorkshire and Nottinghamshire adjoining, the old-pattern ventilators may be seen by the traveller in the majority of the mills he passes by, and the new one will no doubt secure a large amount of patronage in large manufacturing, where the dust and particles rising from the work being carried on require to be promptly removed.

**Mr. Samuel Deards.**

Mr. SAMUEL DEARDS, of Harlow, Essex, in a span-roofed house, exhibits his well-known system of glazing without putty, which we need not advert to further than to say that it is constantly being adopted by new clients. But Mr. DEARDS' domestic heating apparatus is the speciality we desire to call particular attention to. Utilising an open grate (which he has named the Princess Louise), with tubular bars for his heating surface, an 18-inch fire will enable pipes to be carried to a coil 100 feet distance from the fire, heating all in its way, and even a bath besides, while the return pipe may be carried on a level with, or under the ground, that it may not interfere with the appearance of the room as it reaches the grate. Although the amount of work we have named appears considerable from such a small heating source, Mr. DEARDS can give reference to several he has fixed where it is being effected with the most satisfactory results.

**The Madeley Wood Company.**

The MADELEY WOOD COMPANY, of Ironbridge, Shropshire, still maintain their reputation for appearance and quality of their productions with any of their competitors. Their brindled tiles are known to be of very superior quality, absorbing only a very small quantity of water, and standing any amount of frost. They are perhaps better known as "Broseley"

tiles. The designs are tasteful, and when laid have an attractive appearance. There are probably no makers who have a greater variety of ridges, crests, and finials than the MADELEY WOOD COMPANY, and the latter certainly show artistic merit above the average. The firm, in addition, can boast of a good reputation as makers of fire-clay goods, and their pattern-sheet, illustrated with the various designs mostly in use for manufacturing purposes, will be found useful to those dealing in such goods. Attractive coloured sheets of the building articles are also sent out by the Company.

**Mr. W. White.**

Mr. W. WHITE, 3 Westminster Chambers, Victoria Street, and Abergavenny, is again causing considerable astonishment amongst those who may not hitherto have been acquainted with his "Hygeian Rock" building composition, about the advantages of which we cannot say more than we have done on several previous occasions. An improved method of applying it as a permanent cure for damp walls, recently introduced by the patentee, has met with much success, and may be described as follows:—In the first place, the plaster is removed from the face of the wall, and a cavity for the reception of the composition is formed by specially-made locked tiles (which are vertically fixed against the wall by means of a temporary frame) wherein the composition is poured in a hot liquid state. When cool and set, which happens in a few minutes, the tiles are fixed or locked to the face of the wall, forming an absolutely impervious lining, with an undercut surface, upon which a reader of plaster can be placed, and the wall prepared for decoration within six days from time of application. In this manner any wall, however wet, can be made perfectly dry by the introduction of a vertical impervious lining not exceeding seven-eighths of an inch in thickness.

**The Hopton Wood Stone Company, Limited.**

The HOPTON WOOD STONE COMPANY, Limited, Wirksworth, Derbyshire, content themselves by contributing four specimens of stone from their celebrated quarries, which, however, needs no eulogium from us to recommend it. It is shown in a block each, of rough, sawn, fine, rubbed, and polished, supplemented by another of polished Derbyshire fossil marble, also from their own quarry. This specimen is beautifully marked, though we do not consider it materially exceeds in richness the bulk of what the Company are enabled to supply.

**Messrs. S. H. Watkins & Son.**

A multiform collection of building materials—from bricks and timber to locks and nails—is shown by Messrs. S. H. WATKINS & SON, timber merchants, &c., Brentford. There is scarcely an article required in the building of a house that may not be seen on this stand, but beyond the multiplicity of specimens there is not anything that requires especial remark. Messrs. WATKINS also cater for the adornment of our last resting-place, exhibiting several examples—tombs, monuments, head-stones, &c.

**Mr. J. Matthews.**

Weston-super-Mare is again represented in the person of Mr. J. MATTHEWS, of the Royal Pottery, who has secured his usual position at Bay 24. So far as building materials are concerned, POOLE's patent bonding roll square-cornered roofing tiles are the principal articles exhibited, and as these have been before the trade for many years, further remarks upon them are quite unnecessary. But it is in the ornamental portion of his manufactures that Mr. MATTHEWS's name has become so popular. He has brought the articles made from the red clay of his district to great perfection, and the moderate prices at which they are offered has caused an immense sale of them, which is likely to increase seeing that this colour is now so extensively used. While sending a few excellent specimens of vases and other garden ornaments, the display in this section is not so strong as we remember to have seen it on some previous occasions.

**Mr. J. B. Hammill.**

Tiles from Bridgwater, one of the principal "homes" of the industry, are exhibited by Mr. J. B. HAMMILL, of the Saltlands Brick and Tile Works in that town. The designs are varied, but represent the usual "make" of the firm, who have secured a good reputation for quality. The double Roman, triple, and angular are conspicuous, plain and ornamental ridges, hips, finials, &c., helping to make up a very creditable display.

**Messrs. Underhill & Co.**

A small but meritorious assortment of marble, enamelled slate and wood mantelpieces, grates, and the usual *entourage* is exhibited by Messrs. UNDERHILL & CO., 170 and 173 Upper Thames Street. Some good low-priced registers will be found amongst the collection, as well as kitchen ranges. Rain-water goods and builders' castings supplement the exhibit, and we may add that the firm have recently entered upon the manufacture of marble goods, and are extensive dealers in slabs and builders' materials generally.

**Messrs. Yates, Haywood & Co.**

Occupying the position hitherto assigned to Messrs. WELLS & Co., at the east end of the hall, Messrs. YATES, HAYWOOD & Co., of Upper Thames Street, and the Effingham Works, Rotherham, have the largest exhibition in the building, comprised of their principal manufactures. Mantelpieces, grates, and stoves form the principal portion of the collection, arranged in suites with their kindred accessories. There are many elegant designs to be found amongst them, and including the tile work, exhibit true artistic feeling. The firm are also devoting considerable attention to mantels and over-mantels in cast iron, and a variety of these are shown, the majority of the designs being of the "Queen Anne" and "Adams" character. The colouring of some of them is unique. Thus, we are introduced to certain specimens in the Wedgwood neutral green, with white ornament, that can scarcely be identified from a piece of pottery, and the same design is in a few instances shown in three different colourings. Another excellent example is a bold conception for a dining-room in dark oak. The collection of railings in cast-iron after the style of wrought-iron are remarkably good in design. There are other features of interest in the exhibit, and kitchen-ranges in many varieties assist in making up the display.

**Messrs. Williams & Nash.**

Messrs. WILLIAMS & NASH, 9 Castle Street, Holborn, and Church Road, Battersea, are present with a choice assortment of marble chimneypieces, and with each of which are shown tile grates of the latest design, together with tile hearths and marble kerbs *en suite*. The firm pay special attention to the manufacture of the latter, and are offering a marble fender complete, with encaustic tile hearth, for the very moderate sum of forty shillings. Messrs. WILLIAMS & NASH's long experience in the business gives them facilities for obtaining the productions of all the most important Continental quarries on very favourable terms, thus enabling them to place the finished article in the market at prices that will stand comparison with all comers. Another very important department of the firm's is the work executed in serpentine, they being agents for those well-known and unsurpassably fine quarries at Poltesco. The most handsome mantelpiece on their stand is one made of this beautiful English marble, and into the structure of which enter three or four different varieties of it, thereby greatly enhancing its effectiveness. Fonts (one being shown), columns, vases, pedestals, and every description of building dressings, are now being much used in this marble, as it possesses the advantage over all others of not losing its polish when exposed to the atmosphere; and Messrs. WILLIAMS & NASH are also in a position to execute orders for such with the greatest accuracy and dispatch.

**The Sneyd Colliery and Brickwork Company.**

THE SNEYD COLLIERY AND BRICKWORK COMPANY, Limited, Burslem, Staffordshire, send a small but good collection of glazed bricks, a speciality with them, the quality of which is well known to most of the trade. There are some good specimens of marbled designs, Grecian patterns, and printed work, as well as self-coloured. A small collection of fire-clay goods, drain-pipes, &c., complete the display.

**Messrs. Clements, Jeakes & Co.**

Messrs. CLEMENTS, JEAKES & CO, 51 Great Russell Street, Bloomsbury, W.C., are in their old position at Bay 14, with apparatus and other sanitary appliances. Of the former, that known as "EDWARD CLEMENTS' Patent Self-reversing Dash-wheel Washing Machine" has several noteworthy features. The machine is 6 feet in diameter, and consists of an outer case and inner revolving cage, actuated by pulleys upon a

central shaft passing through the case; the central shaft is driven from a counter-shaft overhead, and fitted with a set of automatic striking gear which, by means of a crossed and open strap, causes the inner and revolving drum to reverse its direction at every three revolutions, thereby preventing the tendency of rolling up or balling the fabrics undergoing cleansing, and preserving them from any injury. A similar machine, only 4 feet in diameter, is also shown, for use where no line of shafting exists, the motive-power being a vertical steam-engine connected with it, and capable of driving a wringing-machine and mangle as well. As a proof of the efficiency and value of these machines we may mention they are in use at the War Department, Herbert Hospital, Woolwich, and many of the large hotels and asylums throughout the country.

**The London Patent Automatic Disinfecter Company.**

THE LONDON PATENT AUTOMATIC DISINFECTOR COMPANY, 53 Queen Victoria Street, and Cannon Street, E.C., exhibit their simple and ingenious invention for deodorising closets and drains. Our illustrations show the apparatus itself, and as it appears when connected with the closet underneath the seat.

It consists of a copper globular vessel, to which is attached a central pipe for filling with a disinfectant, a metal pipe on the right-hand side for connecting to the water supply, and one of very small diameter on the left to be carried over the top of the closet-pan. The copper ball is filled with any powdered disinfectant that has the property of being rendered soluble on coming into contact with cold water. On lifting the plug to obtain the flush of water a portion of the discharge passes into the copper vessel, rendering a small portion of the contents soluble, and carrying the disinfectant in the form of fluid through the small pipe into the pan, the clear water and the disinfectant meeting at the same time, and rendering the entire body a deodoriser and flushing closet and drain every time it is used. The advantage of this appliance over the few others attempting to effect the same object is that it deals with solid disinfectants instead of liquids, making its own liquid, and doing this by automatic action of an unerring character; and by using the solid material sufficient can be stored in the small copper holder to last a very long time. The Company fearlessly assert that it will hold sufficient to last in a domestic closet in daily use for twelve months, and to provide a disinfectant for 10,000 gallons of water. We are informed that it is being extensively taken up by owners of emigrant ships, where the closet arrangements are generally susceptible to great improvement; and we find that some manufacturers of closets now exhibiting at this exhibition are showing the invention in connection with their own appliances. In adopting this apparatus we are not confined to one disinfectant, the Company being prepared with several, all soluble, and possessing an aromatic odour.

**Messrs. H. W. Cooper & Co.**

Glass ventilators in a variety of forms are shown by Messrs. H. W. COOPER & Co., Limited, Upper George Street, Edgeware Road. Mr. COOPER was the original inventor of the circular glass ventilator for attaching to windows, and that we now find in such extensive use. These form a conspicuous feature in the exhibit, and it would be difficult to find a better-looking or more easy means of attaining the desired object in houses where a complete system of ventilation is not in existence than by these glass window appliances. No injury to walls or decorations are necessary, no unsightly excrescences are visible. The taking out of one pane of glass, and the insertion of another containing the ventilator, effects the desired object, which can be regulated to the minutest point. For very large windows the firm have introduced a bold one of oblong form running on ivory rollers, that has a handsome appearance, and, when opened to its full extent, is capable of admitting a larger amount of fresh air than any other of its kind we are conversant with.

PRIZE MEDALS.—London 1851; Paris 1855; London 1862; Paris (Silver) 1867; London 1874.

**WILLIAM TONKS & SONS,

"Thoroughly well baked, hard as silicate, and utterly damp-proof, in shape they are perfect, fitting one into the other with the precision of a Whitworth gauge, whilst in colours no tile in the market can surpass them. This applies to the Geometrical Tiles. The Webb Encaustic Tiles, with new floral designs for hearths, jambs, mantel cheeks, and pilasters, are the choicest in colour and the best contrasted in tones of any we have seen for a long while. These Encaustic Tiles are designed by a true artist, who combines a strong sense of colour, never even in the boldest pattern lapsing into garishness, with an untiring play of fancy."—*Architect*.

"The arrangement of the Pattern Book and Sheet is neat and artistic, calculated to afford to purchasers a comprehensive means of selection in the choice of designs, many of which are novel and good. The tiles are excellent both in quality and colour."—*Building News*.

"They are of great excellence in design. . . . The clay is hard, and evidently sound; the opposite of porous. The material is not surpassed by any found in this kingdom. As we have intimated, there is a wide choice of designs, and these are obviously the productions of a true artist in the style, who has given long thought and study to achieve the right and avoid the wrong."—*Art Journal*.

## THE EXTENSION OF ARCHITECTURAL EXAMINATIONS.

**W**HATEVER shortcomings may be complained of in the recent operations of the Institute of Architects, there are probably few of the better order of members who will not be disposed to approve and support the steps that have been taken in the direction of the development of the principle of an examination test. It is now a good many years—indeed four-and-twenty—since the beginning was made, when Mr. HAYTER LEWIS, one of the honorary secretaries at the time, as the mouthpiece of the Council, laid before a general meeting a scheme for the establishment of a committee to examine all applicants upon the several subjects involved in an architect's practice, and to bestow certificates, for what they might be worth, upon those who should be found proficient. It may perhaps surprise some of those who think the Institute has never had a will of its own to be told that this project, after due discussion, was formally rejected; not so much on principle, however, as in detail. The result was that the preparation of another scheme devolved upon Messrs. ASHPITEL, JOHN PAPWORTH, and KERR, who held their meetings, after the pleasant manner of those days, at the house of Mr. ASHPITEL, at Poet's Corner, the host supplying, in his ever genial way, that wisdom chiefly which is known as the ballast, and his younger colleagues that earnestness of contrivance which in such an enterprise is the requisite sail. In the end a complete programme was settled and approved, and "the Voluntary Architectural Examination" was duly inaugurated.

Two classes of certificates were granted, one for "Proficiency" and one for "Distinction"; but it was quite understood that the examination had no connection with anything like status in the Institute. In fact not a little jealousy was manifested, and there were not wanting elderly gentlemen especially who not only pooh-poohed the whole business in private as boy's play, but recognised it in public with a certain dubiously patronising air which was almost still more contemptuous. Professor DONALDSON himself, who was then *dux* indisputable, never liked the idea of examination in any form. One of his most emphatic sayings was that "the Institute is not an educational body." It must not be supposed, however, that this indicated his adoption of a lower standard than examination would signify; far from it. His standard, now very much lost sight of, was an exceedingly high one; so high, indeed, that his ideal of membership—a sort of impersonal collective membership—seemed to regard certificates of competency simply as an acknowledgment of possible incompetency, a thing not to be thought of. In other words, the Donaldsonian Institute was a supreme dilettante "Academy" of the Queen of Arts, where individuality put off its sandals at the door, and a representative aggregate of artistic, scientific, antiquarian, and literary culture found itself occupying the hall of assembly with a solemnity worthy of the grandest purposes. The mere schoolmaster was therefore left an immeasurably long way behind, and the trades-unionist was nowhere. But it is now plainly to be seen that the whole platform of the guild was changing; and, at any rate, the "Voluntary Architectural Examination" began fairly well. The fact, however, of its being so entirely voluntary must perhaps be acknowledged, strange as this may seem, to have been its strongest point.

Whether the credit of having passed this voluntary examination, even with "distinction," has ever helped anyone to take a better position in the profession, is a question which does not seem to be so readily answered in the affirmative as might be wished; but there can be no doubt that, during the interval that has elapsed since the date of its introduction, the demand for an examination test in English professional business generally has considerably advanced. A remarkable instance is afforded in the case of the "Surveyors' Institution." This is a society composed, on a very broad and elastic basis,

of persons who "survey," such as house agents, land agents, auctioneers, land surveyors, building surveyors, compensation surveyors, "architects and surveyors," and, in short, valuers of all sorts in that connection of business. Outsiders might well be excused for supposing that gentlemen of such a class, or classes, would prefer to avoid academical tests, and to rely entirely upon native shrewdness and experience; but the fact is that even here the genius of examination has so effectually taken possession that the Royal College of Physicians itself can scarcely show a more formidable programme than that of the Surveyors' Institution for the crucial investigation of a young man's understanding. The way, again, in which the Civil Service, and even the army itself, are now recruited in the person of "competition-wallahs," is a standing wonder to certain estimable classes of our youth. Nor can we even have a tooth drawn nowadays without being invited to think of a diploma. And if architecture, in whatever common acceptation of the term, is to keep pace with things in general, it may be said to be quite clear that the Institute must fall in with the rule. These are the days of examination all around, and perhaps it is best to inquire no further; sauce for the surveyor, to say nothing of the soldier and the dentist, must be sauce for the architect.

Accordingly, a couple of years ago, a new rule was introduced at the Institute, requiring all candidates for the preparatory, preliminary, or probationary stage of membership called Associateship to undergo an examination. It was understood that the trial need not be too severe at first, but the principle that some reasonable line of ignorance ought to be drawn for the sake of respectability was fully accepted, and it is quite apparent already that the days are gone by for the admission of young gentlemen willing to pay a few guineas for the use of academical initials on account of their being engaged in "the study of architecture" as pupils in the office of a dilapidation surveyor. There was one phenomenon, however, of a remarkable character, which came about incidentally in connection with the process of establishing this rule. For some time immediately before the date at which it had been arranged that the examination should be absolutely compulsory upon all comers, the applications of those who (not to put too fine a point upon it) disliked the idea of submitting themselves to invidious comparisons were delivered in such profusion that it might be said they took the Institute by storm; and the list of Associates, as it actually stands at this moment in order of seniority, consequently records the admission of a hundred at a time up to a certain point, and then a sudden drop to three or four. It remains to be seen in future years whether practical success in business is to attend upon the more cautious common sense of the many who were satisfied to acquire a status without earning it, or upon the more courageous enterprise of the few who preferred to win their spurs by open challenge.

The new principle has not yet had time to prove in the slightest degree how far it is calculated to raise the intellectual standard of architectural practice, which is of course the proper end in view; but it seems to have been sufficiently well received throughout the country to induce the Council to try at least one provincial examination, which was held in Glasgow a short time back; and, as was announced still more recently, the general body has seen fit to encourage an endeavour to hold similar examinations in the colonies also. All this seems quite worthy of approval; and indeed there are only two points which, so far, seem to call for remark. On the one hand it may be doubted whether the acceptance of compulsory examination in principle will really be so universal or so cordial as its promoters appear to hope; on the other hand it may be questioned also whether they are not already proceeding too fast.

A further proposal has been brought before the general body to the effect that the admission to the Fellowship itself, or full membership, shall now be barred by an examination. This is a much more important measure than any of the preceding, and, what makes it still more important, it is plainly announced that the Council are in the meantime holding over certain applications for the Fellowship, which, although based upon the statutory qualification of seven years' practice, seem to them to come from persons who are not of adequate age and experience. In other words, the supposed adoption by the profession at large of the principle of an examination test for Associates of the Institute has naturally raised, in the mind of the Council, the standard which they think the profession

must be inclined to set up for Fellows of the Institute; and it can scarcely be denied that this conclusion is so far a fair one. But still we may venture to hope that the greatest caution will be exercised, for there are many points of difficulty to be taken into consideration.

Perhaps the safest way might be to accept the proposal in principle, but in vague terms; in fact, to avoid purposely all details whatever. The precise plan proposed is practically to deny to all except Associates the right of nomination as Fellows. If the Associates were all examinees, this would have the effect, no doubt, of advancing the pretensions of the guild in a signal manner; but so very few of them are examinees in fact that this effect would obviously be altogether uncertain for many years to come. Might it not be better merely to introduce the rule that examination (in the most indefinite way possible) shall apply to the candidates for Fellowship, for the simple reason that, because the Associates are now subjected to examination, the Fellows cannot in honour evade it? Certainly, it is suggested that the Council shall have power to dispense with the examination in special cases; but such dispensations are invariably a cause of trouble, and it might answer better in all respects to leave the examiners entirely unfettered, and be content to affirm the principle.

### STUDIO NOTES.

**A**ROUND of the studios—which, thanks to the courtesy of artists, is one of the pleasures incident to this time of year—gives, on the whole, a cheering promise for the ensuing exhibitions at the Royal Academy and Grosvenor Gallery. Some strong men among the Forty have put forth their strength; others, who last year were not at their best, have made fresh effort, while outsiders of mark who send to either exhibition come bravely to the front.

It is good news to give that Mr. MILLAIS, R.A., will have six, possibly seven, pictures ready for exhibition during the season—not, however, all for either Academy or Grosvenor. Mr. WERTHEIMER has secured for his "MILLAIS Gallery" three out of the six, all pictures of children, to carry on the series which have won more present popularity for the artist than the manly portraiture or vivid subject compositions by which his name will ultimately live. *Little Miss Muffit*, turning round and letting her pipkin fall, frightened at the big spider, is certainly for charm of attitude one of the happiest creations of the artist. *The Mistletoe Gatherers*, an older girl seated on a rock in the snow, holding sprays of the sacred creeper and a big knife, has hardly the same qualities of execution; while, on the contrary, for colour, pose of the figure, and splendid brushwork *A Message from the Sea* is supreme. This title is given to the picture of a bright little girl, seated by the sea, reading the tattered letter which she has found enclosed in a bottle the waves have cast ashore. The theme is suggestive and set forth with artistic grace and freshness. *An Idyll* seems odd nomenclature for Mr. MILLAIS's subject picture for the Academy—a drummer-boy in brilliant regimentals seated on the grass beneath the trees, and delighting the ears of a group of young gipsy girls with the notes of his life. The painter has tackled the splendours of scarlet and gold, and the fresh tints of the copse wood, with his old audacity. A vigorous, half-length portrait of *Mr. Wilson*, in black velvet shooting-dress, gun under arm, crisp and firm work as possible, and the admirable profile, half-length, of *Mr. Irving*, the actor, for the Garrick Club, complete the list of Mr. MILLAIS's pictures, if we except a portrait of a lady in ivory coloured drapery against a gold background, which is as yet only laid in slightly. It is altogether refreshing to find the leading painter of our school in such complete mastery of his power, indulging in no *bravura*, but enjoying a difficulty, and bringing honest, strong work out of simple or complex material.

By right of presidential rank we should have taken first note of Sir FREDERICK LEIGHTON's chief contribution to the season's art, which, indeed, is an important effort. The looked-for composition, *Cymon and Iphigenia*, is on life scale, and proves fully assailable in claim on attention. IPHIGENIA, a form of sumptuous beauty, swathed in abundant creamy draperies, is stretched in sleep beneath the trees, her arms flung backward in *abandon* of repose, the lines of the torso and limbs large and studious of undulation. At her feet the

figures of a sleeping woman and a child are grouped in a peculiar and involved position; another woman is seated at the head of IPHIGENIA, in the shadow. CYMON, in a red cloak, looks upon the maiden, or should look, for somehow the artist appears in this figure to have ceased to take interest in his work, and the CYMON is a blot. In the background the moon rises above the sea, or the sun sinks—we must confess we are not quite sure which, a state of mental uncertainty arising from the entirely artificial lighting of the composition. The picture is another example of the artist's eclecticism of style which sometimes seems to bewilder not only the onlooker; it illustrates also a certain delight in beauty for beauty's sake, and a refined capacity for its expression, which are the painter's prerogatives. Some elegant portraits of children are among the pictures to be shown. Nearest to the work of Sir F. LEIGHTON in sympathy this year is perhaps that of Mr. CALDERON, R.A., whose small poetic picture, *The Birth of Venus*, who lies afloat on the azure waves, while the seagulls poise and flutter in curious joy over the radiant vision, has been secured for the Grosvenor Gallery. This may not be a Greek or a Renaissance version of the subject, but it is sufficiently refined and eminently brilliant in colour and execution. Two upright panels of foliage and figures, and an impressive figure of *Night* as a statuesque woman in dark draperies enthroned on a marble seat, a treatment reminiscent of DELAROCHE, are portions of a decorative scheme for a private mansion. Mr. ARMITAGE, R.A., who is ever faithful to traditions of high art—learnt in the school of the great French painter just named—has finished, under the title *Faith*, the gospel story of the woman who, amid the crowd, kissed the hem of CHRIST's garment that she might be healed. The picture is careful, with well-selected typical heads. But Mr. ARMITAGE has under hand a composition on heroic scale of the *Burial of a Christian Martyr*, whose body is let down by ropes into a catacomb chamber, which, for broad dignity of treatment and serious style, will be an eventful apparition amid the mundane realism of modern art. Elegant *genre* still finds exponent in Mr. MARCUS STONE, A.R.A., who in two upright compositions sets forth with soft, close *technique* and a palette of tender artificial tints, the *Quarrel* and *Reconciliation* of a husband and wife. In the last scene the pair have paused at the stile of the village churchyard, where the grave of the little one has moved their hearts, as in TENNYSON's ballad the legend runs, to "kiss again with tears." Mr. PHIL. MORRIS is in full swing of his narrative powers with the white ship returning from her voyage in tropical waters, and running into the green home harbour, while lads and lasses pace up the quay triumphantly to the greeting place. The canvas glows and quivers with light and wind. There are some charming portraits of children, especially a little damsel in white satin, poke bonnet and all, seated on the last step of the staircase. The execution of this is of the artist's best. A scene in a country churchyard, where *Joy and Sorrow* meet in the newly-christened infant borne joyfully past the grave of the little one gone home, is rather thin both in sentiment and workmanship. Mr. YEAMES, A.R.A., has a good little subject picture of the wits at the *Kit-cat Club Toasting Little Lady Mary Montague*, and some portraiture. Mr. EYRE CROWE, A.R.A., has been to Rouen for material, and brought back a lively scene at *The Fish Market*, and a capital study of the courtyard of the Convent de l'Aître, near St.-Maclou, once a burial-place, as the carved skulls and crossed bones on the old woodwork testify. The nun's little scholars are standing about, and the picture which was painted out of doors is full of light, and is of excellent execution. Mr. PETTIE, R.A., besides a portrait of a certain amateur orchid fancier of Birmingham, which is his best work of the year from the artistic point, has two clever subject pictures—*The Vigil* of a young soldier in the Middle Ages, whom the dawn finds still kneeling sword in hand before the altar of a Norman church, and a composition wherein a group of early Christian monks are standing on the outskirts of a wood at sunrise, to settle by the falling of the shadow of a rude cross where they will place the altar of their church that is to be. Both pictures, with much that is dramatically powerful and originally thought out, suffer by the unsatisfactory treatment of background, a certain unsubstantiality, and from the peculiar scratchiness of the artist's touch. The face of the knight of *The Vigil* is a fine study of expression; though taken from a manly model, the painter says that for the fervent rapture of the eyes he had to paint from a woman. The colour of the other

picture is rather hot with yellow-browns; but the management of the sudden sunrise light flashing on eager faces and trembling into the recesses of the wood is most amusing.

Portraiture is safe in the hands of those already named, to whom must be added the name of the portrait-painter *par excellence*, Mr. F. HOLL, R.A., who has an amazing array of good work. None is better than the bust portrait of his late father, *Mr. Holl, the Engraver*, a three-quarter face, with fine turn of the dark blue eye, and free treatment of hair. The Temple barristers ought to be pleased with their full-length of *H.R.H. The Prince of Wales*, which is admirable in style. A fancy portrait of a little girl, *The Soldier's Daughter*, holding her father's sword across her knee, is also capital in the firm, broad brushwork. Mr. RUDOLPH LEHMANN has been very happy with his sitter, *Mr. Spencer Wells*, the eminent surgeon. A keen, strong personality is here, with the eye of acute observation and the well-knit handsome hand of the manipulator. Mr. WELLS wears the robes of his faculty—black, with red lining—that shows here and there and helps to give colour.

Our old friend, Mr. MARKS, R.A., is one of the few painters who keeps at the level of the excellence he has attained to; of none can one feel so sure in his own *métier*. So this year in the large picture of two adjutant storks, looking for all the world like the *Two Foolish Justices* which their Shakespearian title calls them, in the quiet couple of WALTON's disciples seated chatting outside *The Angler's Rest* over some piscatorial point of difference, or in the inimitable study of an old *Entomologist* manipulating his dried insects, Mr. MARKS is, as always, quietly racy in humour, firm in drawing, solid, and even in *technique*. After this kind of painting the slash and dash of that clever and audacious painter, Mr. HERKOMER, A.R.A., whether in subject pictures or portraiture, seems, to say the least, uncontrolled. But of his work we will defer speaking, as we must also of Mr. BURGESS's vivacious *Spanish Wedding*, which is likely to be one of the most "drawing" pictures of the year. The public like a story, and it is to be hoped that from interest in the drama of the fine composition by Mr. H. SCHMALZ, *Too Late*, they will not pass over the extreme care which he has put into it. A girl lies dead in her white shroud near the open window of an ancient British stronghold; the dawnlight falls on her still form, on the lilies on her couch, the rush-strewn floor, and the painted and inlaid furniture of the chamber; falls on the mourning figure of an old man and a young boy. Out of the shadow into the faint light comes the eager armed figure of the girl's Roman husband, returned with his company of soldiers from the wars, "too late" to greet a living wife. Through the window can be seen a landscape of mountain and wood, mysterious in the early morning, while on distant walls of the castle stand figures dark against the sky, kindling watch fires. The picture belongs to historic romance, conceived in the spirit of German art of the romance school; in a colouring of subdued contrasts and a certain approach to stage effect the same affinities can be traced. But Mr. SCHMALZ is for all that original in his treatment, and cannot be praised too warmly for his thoroughness and artistic handling. Among outsiders few men show more consistent advance from year to year.

We have left little room for notes on the landscape, and, as it is in the fashion to say, the seascape artists. Mr. PARSONS has two large studies of autumn evenings over the windings of SHAKESPEARE'S Avon river; the one grey, rainy, gusty, with fretful wind that buffets the brown-thorn trees on a knoll above the valley, ruddied with winter berries; the other, calm, golden, with lustrous clouds lying dreamily above the wooded level of the hill. Mr. HENRY MOORE has painted again, as no one can better, or shall we say so well, a heaving sapphire-blue sea *Off the Lizard*, under a sky still electric with thunder-clouds. There is closer finish in this picture than Mr. MOORE often gives, for though careful in drawing, he is for effects and tone inclined to rely upon a too crude state of impasto. *The White Calm* of this year would be better for closer kneading, though in quality of gradation it is excellent. A study of the seaweed harvest on the Worthing coast by sunset is for the Grosvenor Gallery, and likely to turn out a fine picture. The newly-elected associate, Mr. COLIN HUNTER, has done much to silence detractors by a group of spirited sea and coast pictures. Of these the best is *Herring Market at Sea*, an admirable study of calm, restless, and limpid water, thus broken into various surface by wind and current, of fishing smacks and steam sloops, and a windy sky. There is much

less of the knife in the handling, and the colour, though still harsh, is cleaner. Another picture of green tide-waves rushing in between reaches of brown boulders is masterly in drawing and brilliantly luminous.

Thus far we may introduce our readers to the May exhibitions beforehand, for the fatal words "doubtful" and "rejected" will hardly touch the pictures we have named. By all accounts they have had to sound over even more than usually good pictures crowded out. The landscape artists especially, with ambitious scale and excellent work, have wrung the hearts of the selecting committee, forced to be inexorable.

## THE BUILDING TRADES EXHIBITION AT THE AGRICULTURAL HALL.

IN drawing attention to the few remaining exhibits that we are desirous to mention in connection with this late exhibition, some remarks on its general character will not be without interest. In the opinion of many, a crisis has arrived in the fortunes of this annual display. It is generally admitted that of the five exhibitions that have been held that of last year was the most successful, whatever point of view we regard it from. It has been urged that, although the entries this year rather exceeded those of last, they were of a more mixed character, and not so much in consonance with the great industries for which it was promoted, and they argue from this that the interest in the exhibition is declining. While admitting some of these deductions, we are not disposed to take so pessimistic a view of the situation. The present year has been an exceptional one, and such as is not likely to occur again for some time to come. We allude, of course, to the attractions of the International Health Exhibition on the eve of being opened at South Kensington, and we may repeat the remarks that we made in our first report here, that in being enabled to keep up his entries to anything like their former standard, Mr. SHRAPNEL scored an unequivocal success. But in looking at the Exhibition that has just closed, notwithstanding all the changes that appeared in the exhibitors, we consider it was a fair representative display. If some of the exhibits were not so large (which, perhaps, is not a disadvantage) the owners took care to display the salient features in their manufactures, and it cannot be denied that building materials were well represented. If we turn to decoration, the most fastidious could scarcely have found fault with the display, and there appears a decided tendency on the part of manufacturers of such to patronise the Building Trades Exhibition; and we believe we are correct in hazarding the assertion that there was more of it this year than on any previous occasion.

Amongst those not yet mentioned we may call attention to the exhibit of tiles made by the noted firm of JOSEPH WEDGWOOD & SONS, Etruria, Stoke-on-Trent, who have recently entered the lists as exhibitors at various exhibitions. As emanating from such a firm, we may be sure that everything they exhibited bore the impress of merit. A finished production, some nine feet high, *The Widow's Mite*, was a veritable work of art. The background of this was composed of tiles made by a new impressed process, which obviates the necessity of expensive moulds, and dyes the colour a low-toned green, with a slightly-raised pattern upon it. The life-sized figure of the woman and the drapery, with a boy clinging to her, was in white; the hand outstretched with a coin in it. The words underneath, "Safe bind, safe find," may be taken exception to by some, seeing that they have become somewhat hackneyed by certain people for advertising purposes. This panel has been purchased for the Bristol Savings Bank, and is not an inappropriate ornament for such a place. A London firm—Messrs. MILLER, LITTLE & Co., 44 Devonshire Street, W., were also exhibitors of tiles and other decorative work. The former, which were all hand-painted, were not only painted, but fired in London, and they one and all had an artistic touch with them; some of the continuous patterns, such as the iris and lily, apple-blossom, &c., in panels, evinced much merit. Another exhibit in tiles, not yet mentioned, was the CRYSTAL PORCELAIN POTTERY COMPANY, St. Bride Street, E.C., and Colridge, Stoke-on-Trent. These productions had a remarkably fine gloss upon them, as if a coating of glass had really been applied to them, and one or two of the self-colours shown were a little out of the

ordinary "run." The makers claim that they are all vitreous; and unglazed ones were exhibited for damp-resisting floor and wall coverings, the patterns generally being very good, and the colours harmoniously worked in. Another class of decoration that appears anxious to make itself a home at the Building Exhibition is that of painted and stained glass. In this department Messrs. A. L. MOORE & Co., Southampton Row, Russell Square, introduced us to some choice *morceaux* in ecclesiastical subjects, and some equally good designs for domestic purposes. There was an absence of all "glare" in the treatment of the subjects, which were evidently the work of practised hands. Mr. CHARLES EVANS, 20 Warwick Street, Regent Street, who is not only a stained-glass artist, but art tile painter and mural decorator, contributed some excellent specimens of his work. These also included ecclesiastical and domestic designs, subjects from "Elaine," "Evangeline," &c., being well conceived. In addition to the glass were some attractive specimens of L'HEUREUX's patent marble engraving for church and domestic decoration, a company of which Mr. EVANS is managing director. Even manufacturers of terra-cotta figures and ornaments are now seeking publicity here, and the Ipsen Terra-Cotta Fine Art Pottery, Copenhagen, represented by Messrs. ARUP BROTHERS, of Bond Street, may well cause the home makers to look well to their laurels. In artistic treatment the statuettes, reliefs, &c., are the works of men of experience, and some plaques after "Thorwaldsen" in two colours were much admired. In colour the Swedish clay is not quite so deep or of so warm a tint, and it is the only objection if it amounts to as much that we can find with it. But the Torquay Terra-Cotta Company were well represented by their agents, C. B. PARE & Co., London Wall, and sent an admirable collection of the numerous articles in which they work their plastic material, some very pretty specimens being amongst them. The statuary comprised many well-known classic names, in which the female semi-nude abounded. The painted work was also commendable; but we prefer the clay without the addition of any pigment. Furniture, too, which may fairly be classed as decoration, always finds a few exponents; and in this instance was well represented by Messrs. JINKS & WOOD, Holborn Viaduct, who supplemented their own manufactures with some examples of wall decoration in Japanese and other papers, &c. A bay was devoted to both dining and drawing-room furniture, the former containing, amongst other articles, a splendid sideboard in very dark mahogany, and choicely carved in the style of French Renaissance. An old veteran in the form of a Chippendale chair, said to be about 170 years old, appeared as a somewhat amusing contrast to the newly-finished work around it. The drawing-room furniture was mostly white, the coverings approaching the crushed strawberry colour. A handsome Shératon cabinet formed a good background. A quaint addition to this exhibit consisted of a few specimens of Persian *faïence* framed as pictures in relief, remarkable more because they were the work of such a distant clime than from any real beauty or artistic merit. As a cheap mode of producing effective decoration in imitation of stained glass may be mentioned the patent "glacier" window decorations of Messrs. PERRY & Co., of the Holborn Viaduct. It may be urged that it is debasing to lower the art of glass-staining in such a manner; but we live in an age in which we are called upon to place within the reach of the masses all that will improve their tastes or raise them to a higher appreciation of the beautiful, and as we cannot decorate their houses with painted glass, although we have gone a great step forward in introducing leaded panes into a cheaper class of residence, the next best thing we can offer them is the "glacier" decoration, a kind of gelatinous picture that they can affix themselves without removing the glass, and at a cost that is scarcely worth notice. Some of the designs are by no means bad, and if not looked too closely into have a very good effect.

Turning to metal work as applied to interior decoration, Mr. ALFRED NEWMAN, of Maddox Street, Regent Street, carried us back to Mediæval times when we entered his bay, surrounded as it was with almost everything required for interior use in hammered iron, no two alike, his workmen having *carte blanche* to make free use of their taste—which they do not appear to be slow to avail themselves of. We here saw the productions of the smith as in ancient times, and some beautiful specimens of the handicraft amongst them. A commanding feature was a fine wrought-iron column, containing five gas-lamps, one of a series of six now making for the Duke of

WESTMINSTER for Eaton Hall, in which the arms of the family were well incorporated in different parts.

Messrs. CAPPER, SON & Co., Ingram Court, Fenchurch Street, had a good exhibit, comprising some ingenious secret urinals and lavatories for office use, a fine display of lavatory earthenware, and PEARSON's patent "twin basin" water-closets, that have been fully described in *The Architect* on prior occasions.

A general collection of gas heating and lighting stoves, and suitable culinary vessels for the same, was made by Messrs. H. & C. DAVIS & Co., Camberwell New Road. There was, however, no novelty amongst the exhibits, but the firm's Metropolitan Gas Kitchener has made rapid progress in public favour, many of the leading gas companies having taken it up, and adopted the system of letting them out on hire at a small annual rental, which has been the means of bringing them largely into use.

One of the best assortments of general sanitary appliances was made by Messrs. BOULDING & SONS, of South Molton Street, W., one of the oldest London firms in this industry. The exhibit comprised some remarkable specimens of lead pipe bending without breakage, their Simplex, Argosy, and Grosvenor valve-closets, BANNER's patent earthenware closets, MACGILL's patent urinals, baths, lavatories, slop-sinks, &c., and a good collection of plumber's fittings. Their patent water-waste preventer flushing cistern, on the syphon principle, was also shown, which is a well-made and reliable appliance. But the greatest novelty connected with closet-work consisted of TRUSS's patent water-waste preventing valve, which we illustrate, invented to dispense with the supply or flush cistern. This is fixed under the seat, as shown in the illustration, and its salient points are that it

can be attached to any existing closet and only requires one plumber's joint to fix it. It dispenses with all valves, bellows, &c., it does away with the large charges for fixing water-waste preventers, &c., and cannot well be affected by frost. It consists of a simple direct-acting valve, which, when opened, causes a partial vacuum, eventually closed by the force of water passing by it, after the orthodox quantity of water has passed through. The length of time the handle is held up does not affect the quantity discharged, which is always the same, and the after-flush is also secured. It works equally well under high or low pressure, and we understand has been approved of by every water company to whom it has been shown. It will undoubtedly prove a valuable addition to our stock of kindred appliances.

Messrs. J. ARTHUR YOUNG & Co., 8 Victoria Chambers, Westminster, are well known as supplying stable fittings of good quality at moderate prices, and exhibited at their stand some good specimens of their work, comprising stall divisions, complete with ramp and middle rail, wrought-iron ventilating panel and bottom sill, manger fittings, consisting of cast-iron manger and waterpot and wrought-iron hayrack, plain or enamelled, for stall or loose box, and other minor accessories.

Horticultural work was represented chiefly by Messrs. MESSENGER & Co., Loughborough, and Messrs. RICHARDSON & Co., Darlington. The former firm have attained notoriety for the "Loughborough" boiler, which is made in six sizes, capable of heating from 100 feet to 1,300 feet of 2-inch pipe, and is one of the simplest and most easily managed we know of.

Their amateur greenhouses are worthy of note. They are made in a number of sizes, but are all so designed and made in such parts as to facilitate their ready transport any distance. The latter firm's exhibit consisted chiefly of models for houses and conservatories of very superior construction, and displayed considerable skill both in design and execution. They also showed the "Amateur's" and "Ivanhoe" independent boilers, and sundry valves, sun blinds, and other fittings. A new system of glazing, either for greenhouses or for other roofs, was shown here for the first time by MESSRS. DRUMMOND & LINDSAY, of Edinburgh. It possesses unique advantages, not the least being its very solid, substantial, and durable character. Since its introduction it has been applied to several roofs of great span and in exposed positions in the north, and has given great satisfaction. Zinc tubular pieces of metal are fixed on the edges of the panes by means of a specially-prepared putty that will not harden. They have the effect of strengthening the glass, and perfectly prevent rain or water penetrating to the edges of the glass in the stormiest weather.

Among the firms sending sanitary appliances we have not as yet reverted to are MESSRS. GEORGE FARMILOE & SONS, Smithfield, E.C., and Mr. JOHN SMEATON, Ludgate Circus, E.C. MESSRS. FARMILOE sent a representative collection of their various goods, consisting of the famous "Du Bois" drawn lead traps, patent American gun-metal valves for hot or cold water, and a good show of baths, lavatories, closets, and the numerous accessories of the plumber's craft. The "Eos" water-closet, recently introduced by this firm, does them great credit. It is made in earthenware in one piece, is valveless, and possesses a good syphon with a cap for inspection, while it is supplied at such a price that it can be fitted in houses of the smallest class. Mr. JOHN SMEATON's exhibit was principally confined to bath arrangements and valves, patent hospital baths, lavatories, his patent cast lead Eclipse traps, and the Bower sewer-gas trap.

An exhibit of bricks that must not be passed by was that contributed by Mr. GEORGE WRIGHT, East Acton Brickworks, Uxbridge Road, W. An ornamental and attractive structure displayed some well-designed and cleanly-made moulded bricks, as well as showing the quality of the rubbers and cutters. At this stand was also a very complete assortment of every description of moulded and facing bricks and other cognate material. In this category, not yet mentioned, was the WOOLPIT BRICK AND TILE COMPANY, 57 Moorgate Street, E.C., and Woolpit, Suffolk, who likewise sent a good general collection, but they made a special feature of their red-and-white Suffolk facing bricks, which they claim stand second to none sent to the London market, and they, at any rate, appear to have every care and attention bestowed upon their manufacture, and the richness of the colour of the red ones is a noteworthy fact.

As we have already mentioned, in a previous issue, building stone is not as well represented as it has been on former occasions, yet there are firms here this year who have not occupied space before. Of these, Mr. M. COLCHESTER W-EMYSS, The Wilderness, Mitcheldean, Gloucestershire, sent some praiseworthy specimens from those quarries, as well as an assortment of ornamental vases and other terracotta goods; and MESSRS. THOS. FREE & SONS, Naphill, High Wycombe, Bucks, sent various classes of work in the stone from their neighbourhood, and also good examples of Bristol blue Pennant stone for building headstones, tombs, bordering, kerbing, pitching, &c., they having lately commenced working quarries in the latter neighbourhood.

Mr. HY. HALL, 19 Doughty Street, Mecklenburgh Square, W.C., showed his patent hanging tiles, for facing old or new walls and partitions, &c. The novelty of these tiles consists in the method adopted for fixing them, which effectually prevents any liability of their falling off. They are secured by nails to battens or rough boarding, and on the face of walls by nails driven into the joints of brickwork, being made to course with brickwork. They can be had in a variety of patterns and colours, 9 inches by 3 inches, or 6 inches by 6 inches, and are also supplied in common redware.

The exhibit of Mr. JOHN DEAN, of Bootle, Liverpool, and other addresses, gives a very good idea of the large and varied purposes for which slate is applicable, and in fact is generally used. It comprises an assortment of roofing slates in the newest designs and in all qualities, including the blue, green, purple, and red varieties from Moelferna, Westmoreland, and other noted quarries; specimens of plain and enamelled slate

slabs for shelves, &c., in different thicknesses; chimneypieces and work such as is used for cisterns and urinals.

The UNIVERSAL VENTILATING COMPANY, Lewisham Bridge, S.E., who some time since purchased the patents of STEVEN'S "Exhaust" ventilators and chimney-pots, made a very creditable display of these goods, and exhibited some well designed ventilators for good class buildings, churches, schools, &c. Some were of a very ornate character, and would add to rather than detract from the appearance of any structure, while the valuable exhaust properties of the patent are in no way interfered with. They are also made in all prices, from a few shillings upwards.

MESSRS. F. WILSON & Co., Stowmarket, Suffolk, showed their various compositions for removing, cleansing, or washing old paint, gilt mouldings, furniture, papier-maché, &c. Of these the most legitimate in a Building Exhibition is the one connected with paint, varnish, &c. It is an alkaline composition, and merely requires to be smeared over the surface of the paint required to be removed, and such is its dissolving power that in a few moments the oldest and most hardened body of paint is rendered soft, so as to be easily scraped off with a palette-knife. Considerably diluted, it is also useful for washing or cleansing painted surfaces.

MESSRS. J. J. THOMAS & Co., 87 Queen Victoria Street, and Edgware Road, made their usual interesting display of wire work, which now forms such an important feature in the decoration alike of private gardens and pleasure grounds. Their exhibit was superior to anything else of the kind in the building, and comprised garden-seats, rose temples, garden arches, wire trellis, and suspending baskets, all being very pretty and tastefully designed. The heavier class of goods, as fencing, gates, cattle hurdles, water-barrows, pea-guards, and builder's sieves, screens, &c., were well represented, as also were the lighter description, which include flower-stands, birdcages, and aviaries. These latter were shown in a variety of sizes and prices to suit all requirements.

MESSRS. E. ALDOUS & SON, sanitary and ventilating engineers, 205 Romford Street, Stratford, E., sent a good collection of their patent ventilators. This ventilator possesses some very unique and salient features, not the least important of which is that by means of one exhaust every room in a house may be ventilated. Another advantage it possesses is that it is quite automatic in action, but in no way depending on the atmosphere, as a strong wind does not facilitate nor a complete calm retard its effect, while it is quite proof against draught.

The machinery exhibited by MESSRS. F. W. REYNOLDS & Co., Edward Street, Blackfriars Road, S.E., was of a thoroughly representative character, as it comprised engines, mortar-mills, saw-benches, band-saw and mortising machines, planing and moulding machinery, and, in fact, every description of machinery used by builders, contractors, coach-builders, and cabinet-makers. It was all more or less in action, and appeared to cause considerable interest, and claimed the attention of practical men, and not only of sightseers.

Last, but by no means least in importance, is a new invention for securing the knobs on the spindles of locks, exhibited by Mr. T. H. P. DENNIS, of Chelmsford, a gentleman who has contributed many useful features in connection with domestic and engineering appliances during his business career. There is, we presume, no housekeeper who has not at times experienced the annoyance of knobs becoming loose and falling off, and, after they have apparently been securely refixed, indulging in the same vexing playfulness. Mr. DENNIS ignores all side-screws and other means hitherto adopted, but drills and countersinks a small hole in the centre of his knob, tapping his spindle some distance down at the same time. When the knob is put on, a long screw of small circumference, with a close worm, is screwed into the spindle until it rests on a level with the knob in its countersunk opening, presenting a perfectly flat surface, and rendering the falling off of the knob, or its even becoming loose, an absolute impossibility. It can of course be applied to all kinds, whether metal, wood, or china; in the case of the last an ornamental finish is supplied for the centre.

We have now mentioned all the exhibits that we consider it necessary to call attention to, and we may add in conclusion that, notwithstanding the differences of opinion that exist, the management have received ample promises of support to warrant them in intimating that the Building Trades Exhibition will be repeated at a corresponding date in the year 1885.

## NOTES AND COMMENTS.

THE competition for the Dublin Museum has been decided, Messrs. THOMAS N. DEANE & SON having been successful. In the second competition Mr. THOMAS DREW, and Messrs. MILLAR & SYMES of Dublin, and Messrs. HOLMES & HORN-BLOWER of Liverpool, with Mr. WILLIAMS of Bangor, also took part. There will be few who will not be pleased to find that at length an Irish design has won the prize. The Committee who examined the drawings consisted of Lord POWERSCOURT, Sir ROBERT KANE, The Lord Mayor of Dublin, Colonel NOBLE, R.E., Colonel FESTING, R.E., Mr. JOHN MCCURDY, and Major PARKER, R.E. It was evident to anyone who read between the lines of the speech delivered by Lord POWERSCOURT, which appeared in *The Architect* last week, that the English designs had no chance of success. It is estimated that the new building will cost 109,000*l.*, and pressure will be brought to bear on the authorities to have the works commenced if practicable during the ensuing summer. The Committee have suggested some slight alterations in the accepted design.

THERE are so few architectural sculptors in Great Britain that general regret must be expressed at the death of WILLIAM MOSSMAN, of Glasgow. He was one of three brothers who gained repute by their sculpture. WILLIAM MOSSMAN was one of the able assistants of the late WILLIAM THOMAS, and was employed by him on the carving at the Houses of Parliament. Afterwards he was engaged by WILLIAM BEHNES and Baron MAROCHETTI. On returning to the North, Mr. MOSSMAN was able to obtain several commissions, and he loyally co-operated with the architects of Glasgow. Among the works he executed were the powerful atlantes which flank the doorway of the Bank of Scotland, and the panels of the Scottish Amicable Assurance Company's office. Mr. MOSSMAN was also an expert modeller of medallion portraits in wax. For some years he taught the sculpture class in the Glasgow School of Design.

THE jerry builder has had little mercy of late days; but it is now proposed to make him also suffer when he leaves this world. At a meeting which was held in the Congregational Hall one of the clergymen who spoke said that he had driven a member of his congregation out of his church simply for belonging to that obnoxious class of builders. Such men, he added, "might be described as predestined villains whose damnation was just." But while giving the builder his deserts, would it not be well if zealous people like the clergyman had the courage to attack those for whom the jerry builder is merely an agent—the men who make large profits by his misdeeds?

THE Newcastle-on-Tyne Natural History Society has obtained the valuable collection of oil-paintings, water-colour drawings, sketches, and woodcuts belonging to THOMAS BEWICK, which was bequeathed by his daughter. It contains five painted portraits of BEWICK. The drawings are mainly of birds; and the woodcuts, of which there are 2,445 examples, are illustrations printed from BEWICK's cuts. The gift is appropriate. THOMAS BEWICK was one of the most accurate observers of animals, and his life was closely connected with the city of Newcastle. If the Committee of the Society will give facilities to others besides members for seeing the bequest, they will fulfil the desire of the testatrix.

THE new set of twelve large photographs issued by the useful Society for Photographing Relics of Old London are mainly suggestive of old-fashioned City dwellings. They are all taken from good points of view, and are surprisingly cheap. The first is the second-hand bookseller's shop in Fleet Street, near St. Dunstan's Church, and which is supposed to have been the residence of DRAYTON, the poet. The windows have been altered, but enough remains to suggest what Fleet Street was like before the Great Fire. Two photographs are devoted to the "Old Bell" in Holborn, which is one of a few relics of the days of coaches, waggons, and highwaymen. The tower of St. Giles, Cripplegate, with the houses and gates in front, form the subject of a fourth plate. The next is of the timber house which stood in Fore Street, at the corner of Milton (Grub) Street, and which might have belonged to a country in which no other material but timber was available. Three excellent examples are given of eighteenth-century work in Great Winchester Street and Austin Friars, and a couple of picturesque doorways of the

same period, from Laurence Pountney Hill. The remaining photographs are taken from College Street and College Hill, and the buildings shown may have been designed by WREN. It is gratifying to find that Mr. A. MARKS's honorary exertions continue to meet with success. The Society has now reached its tenth year, and it deserves to have a long career.

THE public has not heard the last of the fall of the chimney at Bradford. The catastrophe has yet to give work to the lawyers. An action has been entered by a man who lost two of his daughters, but a difficulty arises in respect of costs. The plaintiff having only thirty-five shillings a week, with a family to support out of it, has pleaded that he is unable to make the requisite deposit before delivering interrogatories. It is alleged that the chimney was defective, but the owners of the mill deny this; and it will be, of course, very expensive to secure the evidence of experts in support of the allegation. Interrogatories are therefore necessary. It is said that subscriptions have been obtained in Bradford in support of actions by sufferers, and, with this statement before the Court, Mr. Justice FIELD has declined to dispense with the deposit for costs. At the inquest a great deal of evidence was heard before Lieutenant-Colonel SEDDON, the Government Commissioner, but it will not necessarily avail at the hearing of the cases. If one case succeeds many others will follow.

MR. WILLIAM MORRIS presided at the opening of the annual Whitechapel Exhibition of pictures on Tuesday, and which is one of the civilising agencies employed by the rector of St. Jude's. The exhibition contains over two hundred pictures, and will be kept open for about a fortnight. On Sundays the room is not closed. Mr. MORRIS expressed approval of the opening of galleries on Sundays. "The existence of the idea that only those of high birth or wealth could enjoy art would," he said, "destroy art altogether; so that it was not a question whether we should have art for the few and not for the many, but whether we should have art for the many or not at all. The art property of the working men had in some manner been taken from them, and shut up in the public galleries on the only day on which they could have an opportunity of seeing it." The experience in Whitechapel has been an argument in support of the opening of all museums and galleries.

THERE appears to be some difficulty felt by judges in exercising the powers conferred by LORD CAIRNS's Act (21 & 22 Vic. c. 27) of awarding damages when a plaintiff in a light and air case has been successful. No settled rule has been laid down, but it is understood that, whenever the injury does not render property useless, the Court can exercise its discretion and give damages. In a case which was lately tried before Mr. JUSTICE PEARSON the plaintiff owned four small cottages, let out to weekly tenants, at the south end of a narrow court, which was entered at the north end by a narrow covered passage. At the north end there had been buildings about thirty feet high, and on the site of them the defendant proposed to erect buildings forty-six feet high. The plaintiff's property, if sold, was supposed to have been worth 1,000*l.*, and he said that it was diminished in value about one-third or one-fourth; while the defendant's witnesses said that at most the letting value would be diminished one-tenth. Instead of granting an injunction to pull down defendant's buildings, Mr. JUSTICE PEARSON awarded a sum of 150*l.* to the plaintiff. This judgment will be a valuable precedent, and will go far to remove the personal animus which often inspires actions.

AN inquiry was lately held, by order of the Local Government Board, into the merits of the scheme of the Lower Thames Valley Drainage Board. It was proposed to purchase land on the river-side between Mortlake and Kew Bridge, and to collect on it the whole of the sewage of the Lower Thames Valley, which would be dealt with by precipitation, the effluent liquid sewage being poured into the river, and the residuum employed as manure. The scheme was opposed by the Duke of DEVONSHIRE, who owns property on the opposite side of the river, and by the local authorities of Chiswick. Mr. J. T. HARRISON has now reported in favour of the scheme, and the Local Government Board can grant a provisional order; but it is understood that the opposition will be continued, in order to prevent the authorisation of the grant by Parliament.

AWARDED SOANE MEDALLION 1883-4

BY J. O. HARRIS

## ILLUSTRATIONS.

HIBERNIAN BANK, COLLEGE GREEN, DUBLIN.

THIS building, which is in one of the best positions in Dublin, was designed by Mr. THOMAS DREW, R.H.A.

DESIGN FOR A THEOLOGICAL COLLEGE.

WE publish reductions of some of the geometrical drawings which gained for the owner, Mr. J. O. HARRIS, of Bolton, the Soane Medallion. It will be seen that the style adopted is mainly Gothic; but in some of the buildings an effort has been made to introduce a later style in such a way as to clash as little as possible with the remainder. The design shows a knowledge of detail, with originality in grouping, and it deservedly obtained the principal prize of the Institute. It is creditable to find such excellent work produced in a place like Bolton, where a student has not the opportunities which are enjoyed by competitors in the metropolis and the larger provincial towns.

FELMFOEL VICARAGE.

NEW BREWERY, BRADFORD, WILTS.

THIS building is nearly complete, and has been carried out from the designs of Messrs. WEAVER & ADYE, of Bradford and Devizes.

## THE CASTELLANI COLLECTION.

AN occasional correspondent of the *Glasgow Herald* gives the following account of the collection of antiquities formed by the late Alessandro Castellani, and which the principal museums of Europe have been desirous to possess:—

To walk through the twelve rooms in which the Castellani collection is arranged, with one's eyes opened to the beauty of what is to be seen there, and one's mind awake to the impressions which ought to be derived from its contemplation, is to make a most fascinating journey amidst the relics of ancient history spared from the wreck of nations. Egypt and Cyprus, Greece and Etruria have furnished specimens of the potter's art: the *balsamarium* and *lekythos*, for holding ointments and perfumes; the *oinochœ* and *prochoos*, for drawing and pouring out wine; the *amphora* and *phithos*, for holding liquids; and the *kantharos* and *rhyton*, the ancient drinking-cups, with many others. It is not only the graceful forms of these various vases which render them objects of such beauty and so much sought after, but many of them bear pictures which are so many illustrations of ancient mythology and history, of manners and customs, and of the heights reached by ancient art. This collection supplies several examples of the crude style of decoration in which the early Etruscans ornamented their pottery—geometrical patterns or ill-drawn and fantastic representations of animals—and fragments of inscriptions in that language, which, though its characters are all understood and proper names are interpreted, still baffles the ingenuity of the learned. Greece, in its archaic period, furnishes vessels in the form of a cock, a running hare, a wine skin, or the head of an unknown animal. In the series of vases which have black figures on a red ground one bears a representation of Minerva Athene in a long tunic with embroidery, and armed with the ægis and a round shield. On another is represented the departure of a warrior in a chariot drawn by four horses. Hercules struggling with the Nemean lion forms the chief ornament of a third, and a fourth exhibits the same hero carrying off the Erymanthian boar. The poetical story of Apollo pursuing Daphne is admirably illustrated on a vessel for pouring out wine. The god crowned with laurel, his long hair flowing in curls, his right arm extended, a laurel branch in his left hand, is represented running his very swiftest. Daphne, who is soon to be transformed into a tree to save her from her persecutor, with both arms extended, and with shorter steps in her flight, looks back pitifully at Apollo. The design is excellent, the drawing of outlines graceful and sure, and the figures are red upon a black ground, brightly varnished. Hercules in a cradle, killing the snakes, as an American would describe it, with Minerva, tall, graceful, and beautiful, watching over him, is the chief subject on another vase, one of those used for carrying water, and which was probably a kitchen utensil borne on the head of an ancient Greek maiden to and from the fountain. One of the most rare and remarkable specimens of the best style of ancient Greek water vases, and which is likely to bring a very high price, has three handles, and is distinguished for its varied and brilliant colouring and marvellous preservation. It is supposed that the subject painted upon it represents Demeter and Koré (Ceres and Proserpine). The flesh of these two figures is painted white, while the other figures are red upon the black ground of the vase. The ornaments worn on the heads and arms of the figures are raised from the surface, and brightly gilded;

around the neck of the vase are two ears of corn gilded. The subject, the composition, the beauty of style, the fineness of execution, the splendour of the colours and the gilding, as well as the elegance of form of this vase, render it one of the most precious existing.

It would be a long task to mention, much less describe, the numerous examples of ancient ceramic art displayed in this collection. The terra-cottas, of which there are many specimens, all yield in value and beauty to the tiny figures from Tanagra in Boetia. A few of such objects in the British Museum are described as "remarkable for grace and refinement in the composition and modelling." Castellani, however, seems to have acquired the choicest works known of this art-centre. "A tiny figure from Tanagra," says Gentile in his "Archæologia," "shows to us the Greek who prays or labours in his humble home; and by their elegance, by their unmistakable artistic imprint, these relics furnish sure testimony that the sentiment of the beautiful had really penetrated and was diffused amongst the whole Greek race." That they were popular objects of household decoration may be concluded from the method and the material in which they are wrought. Greek art had reached its highest point of development at the period to which they are attributed, namely, that of Alexander the Great. The place where they were found is but a day's journey from Athens. That they were moulded is likely enough, but that they were retouched by the hand of a master is evident by the crispness of detail that they still exhibit. They were all coloured, and in many cases completely gilded. The contemplation of them brings to the mind, in a manner superior to any notion that can be gleaned from learned treatises, a complete idea of the grace and charm of Greek art, and leads one to excuse the apparently exaggerated language in which this art has been so lauded. In one tomb eight little figures were found. They all represent winged cupids, but no two are alike, and their height is from three to three and a half inches. The very spirit of happiness and grace of motion seems to have possessed them. In one the little god of love wears a hood, his left leg is forward as if he were running or dancing, and in the hand of his right arm, which is thrust forward, he carries a leaf-shaped fan, with a grace and "go" that a fashionable coquette might envy. In another tiny statuette, the same cupid is a *discobolus* or disc-thrower—the antique quoit player. He wears a chlamys wrapped around him like a scarf; his left leg is forward, his head is bent, and in his lowered left hand he holds the disc. Again he is seen crowned with leaves and flowers, a ball in his raised right hand, his left arm lowered, a mantle wrapped round him like a belt, and his left leg thrust forward. In one statuette he holds a flute, in another he wears a low hat with a knob in the centre, not unlike a Kilmarnock bonnet; and, again, with hood and mantle he extends his arms forward as a child towards its mother. A group of two young girls, the one bearing the other on her back, is charming in outline and sentiment. The young girl seated, with a veil drawn around her head and a dove perched upon her right shoulder, is particularly graceful. In this collection of Tanagra terra-cottas there are thirty-three pieces. The museum that may acquire these will possess a most excellent nucleus for the formation of a department of Greek art. The colouring, much of which remains, is chiefly in pale blue, pink, and white. The preservation of these frail and tiny statuettes is marvellous; their artistic value unparalleled.

There is no collection of antiquities complete without objects in bronze. That metal has passed through the vicissitudes of fire and flood and the destructive agencies of time with comparative immunity. Some of the bronze vases in the Castellani collection are of wonderful workmanship, and are rendered still more desirable by the *patina*, occasionally magnificent blue, with which they are covered. Their forms and ornaments, too, are deserving of notice. One has a handle in the form of the lyre-playing Apollo; another in a swan's head grafted on to the head of a griffin; others again have handles decorated with vine leaves and rosettes and parrot heads. Amongst the utensils in this metal are candelabra and many Etruscan mirrors, with mythological tales or historical incidents incised on the back. One mirror is unique, as its polished surface reflects the features of those who look upon it almost as well as a modern looking-glass. Then there are strigils for the scraping of the skin, and *fibula*, or buckles for fastening the dress; many bracelets and rings, and pins of various shapes. The toilette of an early Roman dame had its special "properties," just as that of a Parisian belle of the nineteenth century, and many of the objects connected with its mysteries are of the same nature as those used centuries ago. Vanity never grows old. The Egyptians who set the Israelites the task of making strawless bricks wore, we are told, wigs, and had their faces painted and powdered. Other objects met with here are a pair of scissors, a razor (in bronze, be it understood), a pair of pincers, a sickle, a hatchet, a *flagellum* or scourge, consisting of a handle to which three knobs were attached by small chains, and which was used to chastise refractory slaves.

In ivory, amongst other interesting objects, the figure of a Greek actor, wearing a tragic mask, through the eyeholes of which the eyes of the actor are seen within, wonderfully carved and in an excellent style of art and full of expression, is one of the treasures

of the collection. An Etruscan ivory drinking-cup, with bands of figures carved in reliefs, is noticeable, apart from its artistic and antiquarian value, by the fact that it is formed from the tusk of an extinct species of elephant. In silver, one of the most curious remnants of antiquity is a fragmentary *palera* found at Salerno, in the south of Italy. In the centre of the plate is King Ramesses II., the Greek Sesostris, holding a bundle of weapons with one hand, and with the other the hair of three kneeling and suppliant captives. Several hieroglyphic inscriptions are seen in cartouches in the space above the figures. The style of workmanship, as well as the historic interest of this cup, render it one of the treasures of the collection. The objects in gold contain a poignard of gilded bronze, the handle of which, in silver, is adorned with a wooden disk, covered with gold leaf. This was found by the French Egyptologist, M. Mariette, on the mummy Aah-mes, supposed to be Amosis, a king of the eighteenth dynasty. It was attached to the left arm of the mummy by a papyrus cord. The god Thoth, in gold, with an ibis head, holding in his hands the mystic eye, is a good specimen of Egyptian style. Archaic Greece is represented in this department by an ear pendant, found in Sicily, and carved with griffins and other figures, wrought with great care in a very antique style. The gold objects furnished by the excavations of Palestrina are particularly rich in ornamentation. They consist of a sceptre, a series of cylindrical boxes, a cup, and a set of buckles. The special character of the decorations on these is their wonderful fineness. Tiny globules, almost dust, lie upon lines scarce thicker than a thread. On other objects lions and fantastic animals are fixed with an art that inspires admiration, and the fineness of which suggests the constant employment of a strong magnifying glass. The style of ornament is of Oriental character, and is believed to be of Phœnician character, dating as far back as the seventh or eighth century before the Christian era. The jewel work of Etruria, which is different from either the Phœnician, the Greek, or the Roman, is well represented. The brother of the late antiquarian, whose collection is glanced at here, has acquired a high reputation for his exact and tasteful reproductions and arrangements of the various patterns in the gold work of Etruria, the popularity of which is largely indebted to his efforts. But besides all this there is a varied collection of ancient Greek and Roman jewels, of early Christian work in gold, of ancient rings and engraved gems and cameos, and of Assyrian and Persian intaglios and numerous scarabei. The head of Aphrodite in Greek marble, heroic size, is one of the finest existing, and is worthy of being placed beside the *Ludovisi Juno*. The collection of Greek medals is exceedingly rich, and contains unique specimens of great value. These, and the objects of the Renaissance and pre-Renaissance period of art, deserve a special mention, both for the sake of the period they represent and the character of the work they display.

### EDINBURGH ARCHITECTURAL ASSOCIATION.

AT the last meeting of this Association, Mr. David MacGibbon, president, in the chair, a paper on "Colour," by Mr. W. Scott Morton, was read. At the outset, Mr. Scott Morton explained the scientific theory of colour. After showing that colour is the effect of light, and that where no light is there is a complete absence of colour, he pointed out that the scientific explanation of how the sense of it reached the eye opened up a wide and intricate field of study for the practical colourist. The scientist shows that the three primary colours of the spectrum are red, green, and violet, the experimental proof of this being that none of these as they are found in the spectrum can be subdivided. But the practical colourist has to deal with pigments, which are never pure; and the ultimate indivisibility of these has fixed his three primaries as red, yellow, and blue, and the simplest proof of the impurity of these is that in the using of them in the best arranged proportions, on a revolving disc, we get gray, not white. This fact suggested a very practical consideration which every artist must keep before him, especially when imitating natural effects in which clear light has to be depicted; and that is—he cannot get the same pitch as in nature, but should bring his skill into play in displaying the quality or relation of the various parts of his composition, so as to give as clear as he can the effect of light. For some time the general tendency in our country had been to colour on a low scale, and this, he thought, was a good sign, as it evinced a desire for harmony, and the avoidance of the garish colours which recently were so familiar to us. At the same time, this low scale indicated timidity, and it was much to be wished that, with an advancing art education, decorators would give us pleasing colour on a higher pitch. Instead of the very cold and thin colours which were commonly used, some bloom and fulness of tone might be used—they would cost no more, and the artistic effect would be enhanced. These northern regions were, of course, unfavourable to the development of the colour sense, and the lecturer illustrated this by pointing to the results of the outstanding glory of Italy, its sunlights. We can never have in this country any such highly-coloured pictures as Venice presents; but, he added, let us be thankful for the lovely tints of the morning and evening sky, the rainbow, the

rich adornment of flowers, the varied plumage of birds, the blue and purple mountains, and the soft verdure of trees, valleys, and hills; and let those who had to spend most of their days in our cities keep their eyes open to the fine pictures to be seen in dull and foggy weather, when we get massive and picturesque groups in various hues of cold or brownish gray against a sky through which the sun is struggling to penetrate, giving us the complementary hues of warm gray, yellow, and orange. After all, we have the gray hue generally present with us, and more particularly in our cities. When the eye is filled with gray in walks abroad, it sought refreshment indoors in its complementary; and hence varied hues of yellow could be satisfactorily used in large masses in our interiors; and when other colours were required on large surfaces for variety, they ought to partake to some extent of a warm or yellowish hue. After giving out further practical suggestions, Mr. Scott Morton observed that one great difficulty in the way of advancement in house decoration was the want of technical education among the working painters. It was often found that the finished result of their work was disappointing, owing to the lack of skill in handling properly the various stages of their work, so as to give the bloom required on its completion. The styles of architecture were so varied that it was impossible to lay down any fixed rules for interior decoration, but he pointed out that every good-coloured scheme has the three primaries in modified proportion—that colouring should be sympathetic, adapting itself to the uses of the building where it is applied, and attention should also be directed to the well-ascertained influence of colour on the spirits and health of the people.

The members of the Edinburgh Architectural Association on Saturday afternoon visited Baberton House, Colinton House, and Bonally Tower. Leaving the city by train for Juniper Green, the party, numbering about seventy, under the conductorship of Mr. Hippolyte J. Blanc, vice-president, directed their steps towards Baberton House. Of the early history of this mansion, said Mr. Blanc, in the notes he had prepared for the occasion, very little information was obtainable. Built, according to tradition, as a hunting-lodge for James VI., it was said to have been gifted by that monarch to James Brand, with whose descendants it remained till about 1786. In the early part of the present century a family of the name of Inglis was recorded as owning the mansion, which, after having been possessed by the Christies, now belonged to Sir James Gibson Craig, of Riccarton. Though less ornate, the details of Baberton House bore a strong similarity to Heriot's Hospital, Winton House, Glasgow College, and Argyll's House, Stirling; and, all things considered, it seemed reasonable to assume that an architect from England, instructed by James VI., furnished the design. There was little noticeable in the treatment of the various apartments—a conspicuous exception, however, being a room at the north-east angle whose ceiling was beautifully decorated with geometric plaster panelling, and which bore the name of King Charles's Room, from having been occupied by Charles X. after his expulsion from France. Having had an opportunity, through the kindness of Mr. Somervell, the present tenant of the house, of inspecting a number of the apartments, with their many fine pictures, the party set off for Colinton House, where, on their arrival, they were courteously received by Major Trotter. The company first examined the ruins of Foulis Castle, within the grounds, after which Mr. Blanc, resuming his notes, said that the family longest associated with the barony of Colinton (originally called Hailes) was that of Foulis, who, in 1531, acquired it from the Cunninghams of Kilmaurs. The date of the ruin was assumed at 1450, and it was supposed to have been erected by the Cunninghams. The present mansion-house of Colinton was built in the beginning of the present century by Sir William Forbes, and, Classic in style, expressed the refinement of detail which characterised designs of the same period. One of the apartments, however, styled the Gothic Room, bore token of the degradation to which the art of Gothic had then fallen. The library contained some very fine examples of Gibbons's art in carved wood; and among the objects of interest in the interior was the chair used by Speaker Abercromby at the coronation of Her Majesty. Having been shown over the house, the company were conducted through the adjoining gardens, with their magnificent holly-hedges—for which hedges, said Mr. Blanc in his notes, they were probably indebted to the monks of Dunfermline, to whom the lands of Hailes were granted by Ethelred, son of Malcolm Canmore. The party, ere their departure, thanked Major Trotter for his kindness and attention, and closed a pleasant afternoon by afterwards visiting Bonally Tower.

### GLASGOW ARCHITECTURAL ASSOCIATION.

THE seventh session was opened on April 1 with a conversation and exhibition of drawings. Besides members' work there were loan collections of brasswork, plaster, and terra-cotta modellings, tiles, and tapestries, &c., &c. The hon. president, Mr. David Barclay, F.R.I.B.A., in the course of his opening address, congratulated the Association on its present prosperous condition considering the late reverses. Referring to the overstocking of the profession, he considered that the wide field now occupied by

decorative art called for many artists to whom the general training received in an architect's office was no bad preparation; it was also a suitable and convenient outlet for the many who at the expiry of their apprenticeship found the work of an architect was uncongenial. Remarking that the student should be catholic in his taste when sketching instead of starting with a prejudice for some particular style, he said that architects would often much prefer to see applicants for situations show sketches rather than designs as specimens of their ability, and this course is often better, for such as they would run no risk of missing the sympathy of some strong adherent of a different style.

The past hon. president, Mr. Leiper, F.R.I.B.A., I.A., then awarded his prize to Mr. William H. McNab; and the Association prize to Mr. William Shanks.

After short remarks from Messrs. Honeyman, Miller, and Gildard, architects, and Mr. Buchan, C.E., a social evening was entered upon.

The Secretary's report states that the office-bearers for the past session have been:—Honorary President, Mr. William Leiper, F.R.I.B.A., I.A.; President, Mr. P. Macgregor Chalmers; Vice-President, Mr. John C. T. Murray; Secretary, Mr. Alexander M'Gibbon; Treasurer, Mr. John Wallace; Business Committee, Messrs. William J. Boston, James Brough, William M'Nab, and William Watson. The membership roll has increased from twenty-nine to forty, eighteen new members having joined and seven resigned. There have been nineteen meetings, with an average attendance of eighteen. The papers read and discussed were:—"Our Work and Aims," Mr. Chalmers; "Saracenic Architecture," illustrated, Mr. M'Gibbon; "Timbers used in Buildings," with specimens, Mr. Smellie; "Architecture of Ayrshire," illustrated, Mr. Murray; "Palladio and his Work," illustrated, Members; "Personal Tours," illustrated, Members; "Modern Work in Glasgow," illustrated, Mr. Wallace; "Decoration," illustrated, Mr. Brough; "Early Christian Architecture," illustrated, Mr. Alexander; "Half-timber Work," illustrated, Mr. M'Nab; "Electric Lighting," with experiments, Mr. Honeyman. These have all been well received by the members, and their subjects freely discussed; the critic appointed to each opening. The Monthly Designing Competitions had the following for their subjects:—Wrought iron grille, marble fireplace, small staircase, oak cabinet, timber roof, memorial cross. Mr. William M'Nab gained the honorary president's prize for a "Hall Interior, Scottish in Character;" and Mr. William Shanks, the Association prize, confined to apprentices, for a "Country Manse." Three competitors for each.

Lectures have been delivered by Mr. William Leiper on "Architectural Rambles;" by Mr. Andrew Wells, on "House Decoration;" by Mr. John Honeyman, on "Air Currents as Affected by the Form of Apartments;" by Mr. Robert Scott, I.M., on "Building Contracts;" by Mr. W. Paton Buchan, S.E., on "Ventilation of Apartments;" and by Mr. James Sellars, on "Fact and Fiction." The attendance at these has been good, both of members and invited architects and assistants. Visits were made to Linlithgow Palace, Mount Stuart House, Bute—second visit; and Doune Castle and Dunblane Cathedral. A class of construction has also been successfully in operation, questions being given out monthly, and the written answers read to the meeting. The branches already considered are masonry, carpentry, formulæ for these, and constructional ironwork. A serious reverse has been met with in the loss of the whole of the Association and much of the members' property, by the fire of December last, which destroyed the premises, after the brief occupancy of only thirteen months. At the same time there were about forty-five drawings hung on the walls—chalk, measured, coloured, and competitive—some of considerable value; numerous casts, lent by members; easels and drawing materials, &c., and the complete library of the Association. Without delay, however, new rooms have been acquired, superior to the last in accommodation, comfort, and situation.

### THE INSTITUTE PRIZES.

IN 1885 the Soane Medallion (with fifty pounds) will be awarded to the author of the best design for a municipal mansion. The building is to be isolated on all sides, and to be placed on a site the area of which is not to exceed 14,000 square feet. The principal rooms to be arranged all on the ground floor, which should be raised some 6 to 8 feet above the level of the street, and consist of—(1) Justice-room, waiting-room, private room for the mayor, and one for his private secretary; (2) Grand entrance, vestibule, cloak-rooms, reception-rooms, large dining-room, drawing-room, banquetting-hall; (3) Private entrance-hall and staircase for the mayor, and residence on upper floors; (4) Kitchen and all necessary offices, including servants' room in basement. Drawings required:—Plans of basement floor, ground floor, and one upper floor; principal elevations, and two sections through principal room; all to be made to a scale of 8 feet to 1 inch. Half-inch scale details on an imperial sheet of paper, and one perspective

drawing, in which the building shall not measure less than 22 inches, will also be required.

The silver medal of the Institute (with ten guineas) will be awarded for the best illustrations, drawn from actual measurement (with dimensions figured both on the drawings showing the general arrangements and on the details), of any important building—Classical or Mediæval—in the United Kingdom or abroad, hitherto unpublished in that manner. The following subject is suggested as worthy of illustration:—A town or country house (including half-timbered houses). The following buildings are also suggested if more convenient to the competitor:—(Scotland) Holyrood Palace; (Ireland) Cashel Cathedral, or any monastic building; (Cambridgeshire) Gateway of Caius College, Cambridge; (Derbyshire) Bolsover Castle; (Devonshire) Church of Ottery St. Mary; (Kent) Knole House; (London) Entrance Gateway to Middle Temple Lane and the Steeple of St. Magnus the Martyr, London Bridge; (Northumberland) Ruined Buildings at Lindisfarne or Holy Island; (Nottinghamshire) Steeple of Newark; (Oxfordshire) St. John's College, Oxford; (Shropshire) Wenlock Abbey; (Suffolk) Long Melford Church; (Wales) Chirk Castle, Denbighshire. The drawings must not exceed six in number: to consist of at least one plan drawn to the scale of 8 feet to 1 inch, or, in the case of very large buildings, of 16 feet to 1 inch; also of one elevation and one section drawn to a scale of 8 feet to 1 inch, with details drawn to a scale of 2 feet to 1 inch, the profiles of mouldings being given one-fourth full size. Competitors are required to send, with their finished drawings, the rough sketches they have plotted on the spot.

The silver medal of the Institute (with ten guineas) will be awarded for the best essay on the following subject—"Pediments and Gables." Each essay, written very legibly on one side of ruled foolscap paper, must not exceed forty written sides of foolscap paper. It must be accompanied by suitable illustrations.

A prize of thirty pounds, under the bequest of the late Sir William Tite, will be awarded to the author of the best design, in the Italian style of architecture, for a grand pavilion in a fashionable watering-place, to stand in a garden, with one of the frontages facing the sea. The building to contain on the ground floor (raised some 2 feet above the garden), a ball or concert-room, 120 feet by 60 feet, with vestibule, cloak-rooms, &c., and a café-restaurant (facing the sea front). On the first floor, reading, smoking, and card-rooms, and ladies' drawing-room. In some part of the building private baths should be provided. The building is to be designed for a space of land 200 feet (facing the sea) by 110 feet. Drawings required:—Two plans; one elevation; transverse and longitudinal sections; all to be drawn to a scale of 8 feet to 1 inch. One bay of the concert-room down to a  $\frac{1}{2}$ -inch scale, an imperial sheet of details, and a perspective view, will also be required. Buildings for a similar purpose at Boulogne, Spa, Ems, Wiesbaden, and Homburg are suggested as the sort of pavilion referred to.

The Grissell gold medal will be awarded to the author of the best set of drawings of an original design for the central hall of a fruit and vegetable market, to be of iron construction, properly lighted and ventilated. The design must include a central lantern. Height of hall to top of lantern (exclusive of vane or finial) is not to exceed 100 feet. Drawings required:—Plan and section to a scale of 4 feet to 1 inch, one bay of the hall to a scale of 2 feet to 1 inch, and one imperial sheet, showing constructive details. The formulas and calculations for strength, &c., of one girder and of one rib must also be given.

### THE EDINBURGH CASTLE HALL.

THE following memorial from the Scottish Society of Antiquaries is about to be presented to Mr. Gladstone, with reference to the restoration of the historical Hall of Edinburgh Castle:—

*To the Right Honourable William Ewart Gladstone, M.P., First Lord of Her Majesty's Treasury, as representing Her Majesty's Government.*

The memorial of the Society of Antiquaries of Scotland sheweth—That the ancient buildings of the Castle of Edinburgh are connected with historical associations which have always rendered them objects of the highest interest to the inhabitants of the city and to Scotsmen generally. That from time to time for many years past public attention has been directed to the unsatisfactory condition of these national monuments, and especially to the fact that the ancient Hall of the Castle is at present divided by floors and party walls, and employed as a military hospital, and that proposals of restoration have been made which have not been brought to practical issue. That at the present time your memorialists believe that the military authorities of the garrison would be well pleased to see the removal of the hospital patients from the existing building, which is in many ways ill suited for their accommodation; and they beg, accordingly, to urge in the strongest manner the advisability of taking this opportunity of restoring the Hall, and other ancient parts of the structure adjacent thereto, to

something like their original condition. The ground on which your memorialists venture to address the Government on this matter is the antiquarian, architectural, and historical interest of the building in question. It is a portion of one of the three most important royal residences of the Stuart kings, and is distinctly mentioned in records of the fifteenth century. It has been the meeting-place of the Scottish Parliament, and has witnessed within its walls some of the stirring events of the national history. Of the form which its restoration should take it is impossible, before the removal of floors and party walls, to speak with any certainty; but ancient features of the building which still remain, such as the roof, the carved corbels upon which its beams rest, and the traces of windows on the southern side, would, it is believed, afford sufficient grounds for a satisfactory restoration. Your memorialists beg, therefore, most respectfully to represent to you, the First Lord of the Treasury, and to Her Majesty's Government, the extreme gratification which it would afford to the subjects of Her Majesty in Scotland, and especially to the citizens of Edinburgh, to be able to stand beneath the roof of the Great Hall of the Castle, restored to its ancient proportions, and to see the building consecrated again to such uses as may make it a pride and ornament to the city. And your memorialists will ever pray.—LOTHIAN, President; ROSEBURY, Vice-President; ARTHUR MITCHELL, Vice-President; W. COCHRAN PATRICK, M.P., Secretary; J. R. FINDLAY, Secretary.

Memorials to the same effect have, it is understood, also been forwarded to the Premier by the Royal Scottish Academy and the Edinburgh Architectural Society.

### SURVEY OF THE LOCHS OF SCOTLAND.

THE following is a copy of the correspondence between the Treasury and the Royal Society of Edinburgh on the subject of the survey of the depths of Scottish lochs.

Royal Society of Edinburgh, July 11, 1883.

Sir,—In consequence of the investigations now being carried on with reference to the physical and biological conditions of the Scottish freshwater lakes, and, also, because of the importance, in certain branches of geological inquiry, of knowing the form of the basins occupied by these lakes, it has been prominently brought under the notice of the President and Council of this Society, that no bathymetrical survey of these lakes exists. I have therefore been requested by the President and Council to ascertain from Her Majesty's Government if there is any probability of this work being soon undertaken, and, at the same time, to state that it would be a great satisfaction to the President and Council to learn that instructions had been issued by the Lords Commissioners of Her Majesty's Treasury to the officers of the Ordnance Survey, or of the Hydrographic Department of the Admiralty, to undertake a survey of a few of these lakes, similar to the excellent ones already made of Loch Lomond and Loch Awe—say Lochs Morar, Maree, Lochy, Assynt, Shin, Tay, Erich, Rannoch, Earn, Doon (in Ayrshire).

I am, &c.

(Signed)

P. G. TAIT,

Secretary of the Royal Society of Edinburgh.

To the Secretary of Her Majesty's Treasury, Whitehall.

Treasury Chambers: September 17, 1883.

Sir,—With reference to your letter of July 11 last, and the reply from this board dated the 10th ultimo, relating to a proposal to execute a bathymetrical survey of certain fresh-water lakes in Scotland, I am directed by the Lords Commissioners of Her Majesty's Treasury to acquaint you that my Lords are informed that the nautical surveys of Loch Lomond and Loch Awe, referred to in your letter, were undertaken by naval officers in the interests of navigation, and that the same considerations do not apply to the other lochs on which surveys are suggested in your letter. My Lords are also informed that the proposed bathymetrical surveys do not come within the functions of the Survey Department of the Office of Works (late Ordnance Survey). Under these circumstances, my Lords regret that they are unable to sanction the proposed surveys.

I am, &c.

(Signed)

LEONARD COURTNEY.

Professor Tait, Royal Society of Edinburgh.

Royal Society of Edinburgh Rooms.

Sir,—I beg to acknowledge the receipt of your letter of September 17 last.

In reply, I am requested to express the regret with which the President and Council of the Royal Society of Edinburgh learn that it is not regarded as within the functions of the Board of Admiralty or of the Survey Department of the Office of Works to undertake a bathymetrical survey of the lochs of Scotland, and that the Lords Commissioners of Her Majesty's Treasury cannot sanction the proposed surveys of the lochs.

It appears to the President and Council that a very important part of the survey of the United Kingdom will thus be left wholly untouched, for it cannot be denied that it is at least as important,

sometimes much more important, to know the depth of a lake than to know the height of an adjoining mountain.

It would be a matter for great regret if the admirable surveys which are now drawing to a close, which reflect so much credit on the officers who conducted them, and do honour to the scientific reputation of the country generally, should be marred by the great omission here pointed out.

In these circumstances the President and Council hope the Lords Commissioners of Her Majesty's Treasury may reconsider their decision, and may yet see their way to sanction the proposed surveys.

I have, &c.

(Signed)

P. G. TAIT,

Secretary to the Royal Society, Edinburgh.

L. H. Courtney, Esq., M.P.

Treasury Chambers, January 2, 1884.

Sir,—I am directed by the Lords Commissioners of Her Majesty's Treasury to acknowledge the receipt of your letter of the — ultimo, expressing the regret of the Royal Society of Edinburgh at the non-acceptance by the Government of the proposal to undertake a bathymetrical survey of certain freshwater lakes in Scotland, and I am to state that my Lords must abide by the decision communicated to the Royal Society in the letter from this Department of September 17 last.

I have, &c.

(Signed)

LEONARD COURTNEY.

Professor P. G. Tait, Secretary to the Royal Society, Edinburgh.

### THE ROMAN ALTAR AT LINCOLN.

A LETTER has been sent to the Rev. Precentor Venables by Professor Hübner, of Berlin—the first living authority on inscribed Roman monuments—giving an opinion upon the character of the altar lately found at St. Swithin's, Lincoln. The Professor regards the altar as belonging to the end of the second, or the beginning of the third century after Christ; and is inclined to the view that the doubtful term "curator" had a religious reference, and that Frontinus was a worthy Roman soldier, held in such high esteem by his comrades that they chose him three times "chapel-warden" of the little place of worship of the troop which, twelve or thirteen hundred years ago, stood on the site of the present St. Swithin's, a forerunner of the modern churchwardens. The following is the letter:—

Berlin: March 30, 1884.

My dear Sir,—I sit down immediately to answer your request respecting the recently discovered altar of the "Parcae deae et Numina Augusti." It is a curious little monument. From the character of the writing, combined with its contents, I am inclined to ascribe it to the end of the second or the former part of the third century. You have rightly hit on the true meaning of the *dea Parcae*, for they seem, as other members of the Greek and Roman Olympus, to have been identified, in provincial worship, with female divinities of foreign or local, or at least non-Roman origin. Whether they are to be considered as *matres* or *matronae*, or perhaps as *nymphae*, is a matter not easily to be settled in a general way. These compound divinities are so extremely frequent that each single occurrence has to be considered by itself. The conclusion to be arrived at about them depends a little on the character of the person who made them a vow and erected the little altar. But this is the doubtful point in the inscription. We know sundry "curators" of different characters (see "Ephemeris Epigraphica," vol. iv., p. 434). There were military ones, *curatores fisci* (cash-keepers) of the prætorian and urban cohorts; curators of *ala* and cohorts of auxiliaries, *curatores veteranorum*, &c. Neither of these charges seems to have been that of C. Antistius Frontinus. If he had been three times in charge of that peculiar *cura* it must have been a temporary one, which, as may be presumed, was not the case with those military *cure*. In Lambæsis in Africa (now the French convict-colony of Lambez) we have a *curator scholæ* who was one of the soldiers of the third legion ("Corp. Inscris. Lat." vol. viii., 2562). Lincoln was a thoroughly military place. I should think it most probable Frontinus was in charge, for the third time, of that same small temple or *Aedicula* to which he gave the little altar now discovered, for the last line seems scarcely capable of another expansion than this: *ar(am) d(e) s(uo) d(edit)*. If Frontinus, as I suppose, was a soldier or a veteran of one of the Roman legions stationed at Lindum, the *dea Parcae* may have been worshipped by a *sodalitium* (or club) of soldiers, who had brought them over to England from their native country. Such a community of worshippers is very likely to have had a common sanctuary, the curator (or warden) of which Frontinus was chosen for the third time. I think TER may be accepted as the complete form of the numeral adverb (*ter*, three times), not as an abbreviation of *ter(tio)* or *ter(tium)*, in spite of Cicero's well-known joke about Pompey's Theatre and its inscription. AR for *Aram* is not a very common abbreviation, but there is certainly no explication of the word more simple and more safe. Who the Augustus was whose *numina* were worshipped by that community, together with the *Parcae*, remains, of course, uncertain. One might think of Marcus Aurelius or Septimius

Severus. But that the reigning Emperor's *numina* are placed in a most loyal mood, besides the other divinities, agrees very well with their supposed military character. This, my dear sir, is all that occurs to me in the way of observation on your nice new Roman altar of Lindum. I hope the soil of your venerable old town will not cease to furnish us with new and interesting objects in the age of discoveries we live in. Yours faithfully,  
Rev. Precentor Venables. E. HÜBNER.

### THE MARKET HALL, BURTON-ON-TRENT.

THE increase in the cost of the Market Hall was considered at a late meeting of the Burton Town Council, when an explanation was given by Mr. Harrison, one of the councillors. He said it had been for some time anticipated that the original estimate would be exceeded, and it was well that the exact state of the case should be put before the public. It would be remembered that the committee recommended for adoption a certain plan selected from a number of competitive designs; but the Council suspecting that the work could not be carried out for the sum mentioned in the advertisement, referred the matter to an independent firm of architects, who reported that out of all the plans only two were suitable, and one of these was ultimately accepted. A contract was entered into for 10,312*l.*, and the Council afterwards entered into a further contract for the stalls and some internal fittings for 830*l.*, thus making the total 11,142*l.*, which amount had been distinctly authorised by the Council. The extras in the contract proper amounted to 2,408*l.*, which was of course a serious matter. This was made up as follows:—700*l.* for additional cost of foundations, 110*l.* for a structural alteration, 275*l.* for making the gallery available for market purposes and railing, 120*l.* for drainage, 282*l.* for iron fittings in butchers' shops, 165*l.* for stoves, fireplaces, and extra gas-fittings in the balcony, and 756*l.* for general extras. The committee did not wish to shirk their responsibility, but it must be apparent there was a great deal of matter in the accounts over which they could not possibly have had control. The contract was deliberately entered into by the Council, based on a certain bill of quantities, and the quantities had now been found to have been understated. That, no doubt, had arisen to a great extent from the way in which the Council had tied the committee down to a sum which was manifestly insufficient. Further extras had been incurred, including 25*l.* for shutters, 154*l.* 10*s.* for carving, 557*l.* for road-making, and 57*l.* for iron rails, which brought the total to 14,672*l.*, exclusive of the charges of the architect and clerk of the works. To compare the gross sum spent with the sum mentioned in the advertisement was, he argued, misleading; and he contended that if any comparison must be made it should be between the 11,142*l.* approved by the Council and 14,672*l.*, which included 557*l.* for road-making, which the committee had not expected to have to do, and the cost of other matters, which might more fitly be put down to furniture than building. The committee regretted the additional cost, but he was of opinion no great saving could safely have been effected without very much lessening the extent of the building, and that was not now too large for the requirements of the town.—Alderman Wardle, in criticising the statement, said the Council voted the original sum on the recommendation of the committee, and if it were manifestly insufficient, why, he asked, did the committee not then find it out? It appeared to him the estimate must have been loosely drawn when something like 50 per cent. additional cost had been incurred before the mistake was found out. He pointed out that the Council obtained a loan of 11,270*l.* on the recommendation of the committee, but 3,200*l.* of that was for land. The plans were submitted to Messrs. Evans & Jolley, and their report was not far wrong when it was remembered that they were not asked to report upon fittings or anything not contained in the plans. The feeoffees afterwards gave 1,000*l.* for ornamentation, and the Council was asked by the committee to allow another 450*l.* for similar work, so that the cost of the hall would be 9,450*l.* Tenders were obtained, and one for 10,300*l.* was accepted, but that amount had been swollen to 15,828*l.*, and it was the difference between those sums which had to be considered. The real fact was that 8,000*l.* was required for the mere shell of the building, and if the committee had said as much, a loan could have been obtained for the fittings. The difference between the loan obtained and the actual cost was too much to be paid out of the year's rates, and he therefore moved that the Finance Committee should be instructed to obtain a further loan of 5,000*l.*—Mr. Auty seconded the motion.—Mr. Riley thought such a discrepancy would not have occurred if the committee had been allowed to select their own plans, instead of having the lot submitted to other architects.—Mr. Turner said that so far as he knew no additional expense had been incurred without the sanction of the Council.—Alderman Lowe said there was hardly a single plan which could have been carried out for 8,000*l.* He pointed out that the foundations had cost 700*l.* more than had been anticipated, and that was an item no human foresight could have provided for.—Mr. Pickering having urged upon the Council the necessity of studying economy, the town clerk

said in reply to a question that the various additions had from time to time been brought before the Council. On this the Mayor remarked that the Council were responsible, and Alderman Wardle's proposition was agreed to.

### AMERICAN CHIMNIES.

AT the meeting of the American Society of Civil Engineers which was held on the 5th ult. descriptions were read of a few large chimnies.

The Pacific Mills Chimney at Lawrence, Mass., which was built by Mr. Hiram F. Mills, C.E., in 1873, consists of an outside octagonal shell 222 feet high above the ground, with a distinct interior core 8 feet 6 inches in diameter inside, extending one foot above the top of the outer shell and 11 feet below the ground. The chimney is founded 19 feet below the ground, upon coarse sand, the foundation being 35 feet square, enclosed by pine sheet piling. The base is concrete, one foot thick, then rubble masonry of large pieces of granite in cement, this stonework being 7 feet high. Upon the stonework is placed the brick chimney, the outer shaft being at the base 20 feet wide, and at the top under the projecting cornice 11 feet 6 inches wide. This brickwork is 28 inches in thickness at the base; at 12 feet in height it becomes 24 inches, which continues 18 feet; then 20 inches for 20 feet; then 16 inches for 40 feet; then 12 inches for 60 feet; then 8 inches to the top. The inside core is two feet thick to a height of 27 feet, and one foot thick for the remaining height of 154 feet. The top of the chimney is of cast-iron plates three-quarters of an inch thick. The horizontal flue entering the chimney is 7 feet 6 inches square. The vertical flue of the chimney is a cylinder 8 feet 6 inches in inside diameter, and 234 feet high with walls 20 inches thick for 20 feet, 16 inches thick for 17 feet, 12 inches thick for 52 feet, and 8 inches thick for 145 feet. The foundations were laid in mortar of Rosendale cement and sand; the outer shell in mortar of Rosendale cement, lime and sand; and the flue walls in mortar of lime and sand.

During the winter of 1873, the flue being 90 feet above the ground, boilers having 452 square feet of grate surface were connected with the chimney with satisfactory results. Between June and September 1874 the chimney was finished. The approximate weight of the chimney is 2,250 long tons, the number of bricks being about 550,000. The chimney is opposite the middle of a line of twenty-eight boilers, and 210 feet distant from them. It was designed to serve for boilers having 700 square feet of grate surface, burning about 13 tons of anthracite coal per square foot of grate surface per hour.

The chimney of the Merrimack Manufacturing Co., at Lowell, Mass., was built under the direction of Mr. J. T. Baker, C.E., in 1882. This chimney is founded on a ledge of sandstone. The foundation, 30 feet in diameter, is built of granite blocks laid as they come from the quarry. At the surface of the ground there is a dressed granite base 2 feet 6 inches in height, laid in clear Portland cement, the remainder of the foundation being in Rosendale cement and sand. Upon this base is placed the brick-work, consisting of three cylinders, the outside one 28 feet in diameter, 24 inches thick, the middle one 18 feet in diameter 8 inches thick, the core 12 feet inside diameter and 16 inches thick. The middle cylinder is carried up vertically 75 feet 6 inches; the outside ring has a batter of  $\frac{42}{100}$ ths of an inch per foot to a height of 100 feet. At the height of 75½ feet the middle ring connects with the exterior ring, making the masonry at that point 36½ inches thick; it is then 20 inches thick for an additional height of 60 feet; 16 inches thick for 70 feet; and 12 inches thick thence to the enlargement for the chimney head. The core is uniformly 12 feet inside diameter to the top, the first 100 feet being 16 inches thick; then 12 inches thick for 60 feet; then 8 inches thick for 90 feet; and then 4 inches thick for 29½ feet to the top. It is entirely separate from the outside masonry, except about the doorways and openings for the flues. The core was laid in mortar of lime and sand; the outside shell in lime, cement, and sand.

The chimney built under the direction of Dr. Charles Emery, M. Am. Soc. C.E., at the Greenwich Street Boiler House of the New York Steam Heating Company, was a creature of circumstances, it being necessary to place within a very limited area a very large boiler capacity, viz., 16,000 horse-power. This was done by making four storeys of boilers; the chimney was therefore necessarily located with reference to these boilers, and the plan of the chimney was determined by the shape of the lot. The beach of the Hudson River was at some time at this locality, and the foundation of the chimney was placed in fine clear beach sand, with some packets of coarser sand and a little stone. The foundation is 1 foot below high water. The chimney is 27 feet 10 inches in the clear inside, and 8 feet 4 inches wide. The height is 220 feet above high water—221 feet above the foundation.

A chimney erected in Mexico for a cotton factory about 160 feet high, had been in use for over twelve years. It was built of apparently sun-dried bricks, and seemed to be now in excellent condition. This chimney was built by Indians and seemed to be

very symmetrical and well made. The bricks were about 10 by 3 by 7. Another chimney described was constructed of old rails, and was in successful use in Pennsylvania. It was generally known as a crinoline chimney. Mr. Wm. E. Worthen referred to several chimneys built by him, and expressed a doubt as to the necessity of very great height in chimneys.

#### Wood-Block Flooring.

SIR,—We have had our attention directed to a letter concerning us, which appears in your issue of the 29th ult., and in which exception is taken to a paragraph in your paper of a former date anent our improved system of wood-block flooring.

Permit us to state that the paragraph in question is in every particular correct. Your correspondents' client has no interest or connection either with the patent system referred to or with our business.

Having incurred a considerable expenditure of money and labour in establishing this wood-block flooring business, we must resent any attempt to injure the same, and shall be compelled to take notice of any further acts of a like nature to that now complained of.

Kindly give this a place in your next issue.

Yours truly,  
7 John Dalton Street, Manchester : GEARY & WALKER.  
April 7, 1884. (Late ANDREWS & CO.)

#### Water Supply to Country Houses and Isolated Buildings.

SIR,—Judging by the extracts from Mr. W. E. Rich's interesting paper, read before the Architectural Association, given in your last week's impression, it would appear that one system, upon which hundreds of isolated residences are annually furnished with pure water supplies, seems not to have been mentioned. We refer to the "Abyssinian" and Artesian tube-well system, which of all others is peculiarly suited to the objects embraced in the paper under consideration.

In the first place, these tube-wells enable the preliminary search for water to be made with rapidity and comparatively small outlay; and then, when secured, the supply so obtained is free from the many contaminations which sooner or later find their way into ordinary dug wells. Given but a fairly impervious stratum overlying the water-bearing seams below, the tubes driven down effectually seal off surface and other soakage which the old-fashioned well practically invites into it.

So much are these facts realised by architects that we are constantly being called in to replace a polluted supply by driving or boring a tube-well from the bottom of an existing well in search of a pure source beneath. Frequently these lower springs, when tapped, rise to very near the surface, and the water is easily raised by manual labour at the rate of 500 to 600 gallons per hour. Occasionally they rise above the surface, yielding a constant flow, which can be led into cisterns and controlled by a ball-tap, just like water laid on from a reservoir. When the springs happen to lay 100 feet or 150 feet below surface a pony-wheel, gas-engine, or hot-air engine will meet all the requirements of a large establishment, by means of simple deep-well pumps designed expressly for tube-wells. Sometimes a windmill serves the purpose.

We are, Sir, yours obediently,

LEGRAND & SUTCLIFF,  
Magdala Works, 100 Bunhill Row, Artesian Well Engineers.  
London, E.C. : April 8, 1884.

#### NEW BUILDINGS.

**London.**—On Saturday the foundation-stone of a new library for the Honourable Society of Gray's Inn was laid by Mr. Arthur Collins, Q.C., the treasurer, at the north-eastern corner of South Square. The new library was rendered necessary by the present library being too small, and it is designed to contain some eleven or twelve thousand additional volumes. It will, it is understood, be completed and fit for occupation by the end of the next long vacation. The new building will have a commanding frontage in the Gray's Inn Road, with entrance-hall, vestibule, and staircase approached from South Square, forming a connecting block with the Steward's office and existing libraries, and will also include suites of rooms for chambers and strong-rooms for the use of firms established in the Inn. Messrs. Isaacs & Florence are the architects.

**Alhambra Theatre.**—This theatre, which has been closed for alterations and decorations for the last three weeks, is to reopen on the 12th inst. The principal alterations which have been made have been the construction of a new and broader staircase in concrete to give access to the dress-circle and first tier of boxes,

and a new entrance to the pit stalls. The screens on either side of the proscenium have been removed, and the opening increased to a clear width of 38 feet. Messrs. J. Shoolbred & Co. were selected after competition to be the contractors, and they have carried out the whole of the works, constructional and decorative, under the superintendence of Messrs. Perry & Reed, the architects to the company.

#### CHURCH BUILDING AND RESTORATION.

**Chedzoy, Somerset.**—The chancel of the church of St. Mary the Virgin, Chedzoy, is to be restored, and the works will be commenced immediately after Easter. There are some interesting features of the thirteenth century, and the church (like many other churches in Somerset) is rich in sixteenth-century woodwork. The erection of a sacristy, on the north side of the choir, forms part of the present contract. Between the nave and sanctuary there exists a sixteenth-century wood screen, which has been cut about and altered at some time, but it will now be restored, and a rood of fair proportions will be added. The works are in the hands of Mr. Slingsby-Stallwood, architect, of Reading.

#### WORKS IN PROGRESS.

**Messrs. Wallis & Strang,** of Newcastle-upon-Tyne, having procured special official inspection of their stained-glass windows, by the Customs authorities of the United States Government, have been informed that in future their windows will be classed as "paintings" among "works of art," and, when the property of a religious society, will be admitted free of duty.

**Messrs. Adams & Co.,** of No. 7 Westminster Chambers, S.W., and York, have supplied their patent flushing appliances to upwards of one hundred towns since their introduction three years ago. The enormous flushing power of these syphons, coupled with the economy of water which their use effects, and their adaptability to any depth of sewer, has thus rapidly brought them into such general use.

**Messrs. Butters Brothers,** Percy Crane and Engine Works, Glasgow, have just erected for Mr. Wm. Brass, builder, one of their celebrated builder's steam-derrick cranes on three stages, to take down and rebuild 130 and 131 Cheapside. They seem very useful and quick.

#### GENERAL.

**Mr. H. Herkomer, A.R.A.,** has left for the neighbourhood of Tremadoc, where he proposes to spend some time under canvas, depicting the scenery about Snowdon.

**Professor Gustave Richter,** the German portrait-painter, died at Berlin on the 3rd.

**M. Meissonnier's *La Rixe*,** which forms part of the Royal collection, will be sent to Paris for the forthcoming exhibition of that artist's works.

**Mr. Edmund Evans** has presented to the Manchester Art Museum a complete set of seven electrotypes blocks used for printing the first coloured illustration in Mr. Randolph Caldecott's "House that Jack built." Mr. Evans has also given the Art Museum a series of fifteen proofs showing every stage of the printing of one of the double-page coloured pictures in Mr. Walter Crane's "Goody Two-shoes."

**The Death** is announced of Mr. Edward Milner, the well-known landscape gardener. Sir Joseph Paxton in 1844 entrusted to Mr. Milner the superintendence of laying out Prince's Park, Liverpool.

**A Prize** of ten guineas offered last August by the Royal Manchester Institution, to be competed for by the School of Art, has been gained by Mr. C. T. Weston.

**Plans for a new Church** at Lightbowne, in the parish of Moston, have been prepared by Mr. A. W. Smith, of Manchester, providing sitting accommodation for 300 persons.

**Mr. J. D. Watson,** of Dundee, has been appointed burgh surveyor of Arbroath.

**The Sum** of 2,500*l.* has been up to the present subscribed for the restoration fund of St. Mary's Church, Warwick.

**The Court of Common Council** have sanctioned a recommendation of the Special Guildhall Improvement Committee relative to the erection of the new Council Chamber, that 8,000*l.* be devoted to furniture, fittings, &c.

**Mr. C. Rolfe,** of Oxford, has prepared plans for the addition of a south aisle to St. Martin's Church, Ongar, and a tender for the work has been accepted amounting to 1,173*l.*

**The South Shields Town Council** have decided on the necessity of building municipal buildings for the borough.

**The City of Berlin** contains 14 houses each inhabited by more than 300 persons, 162 houses inhabited by between 200 and 300, and 2,588 houses by between 100 and 200. The largest number of persons living in one house is 1,080. In 1883 the population of Berlin was 1,226,392, and in 1850 the population was 419,720.

AWARDED SEVEN PRIZES FOR SUPERIORITY, INCLUDING PARIS GRAND MEDAL, 1878, THE CERTIFICATE OF MERIT OF THE SANITARY INSTITUTION OF GREAT BRITAIN, AND THE AWARD OF MERIT AT THE INTERNATIONAL EXHIBITION, 1881.

TO ARCHITECTS.—THE BRICK of the FUTURE, that shall not get dingy or sooty like other Bricks, but, being of a Semi-Vitreous nature, will maintain a clean and washable surface.

## FACING BRICKS AND BRICK ORNAMENT OF TRUE TERRA-COTTA, AS ALSO ARCHITECTURAL WORK, IN WHITE AND WARM-TINTED BUFF.

Made from the Finest Terra-cotta and Stoneware Clays, of a warm and pleasing appearance, of beautiful and superior quality and finish, non-absorbent, acid, fire, and alkali proof, will resist the most severe frosts, and when tested were found to withstand a pressure of 445 tons to the square foot. They have been used in the most exposed parts on the North and South Coasts, and being true Terra-cotta, are warranted imperishable.

Pattern Sheets and Price Lists of superior Glazed Stoneware Sanitary Pipes, and Fire Clay Goods, Chimney Tops, &c., on application.

Sole Manufacturers:—CANDY & CO., Limited, GREAT WESTERN POTTERIES, NEWTON ABBOT, AND 11 QUEEN VICTORIA STREET, LONDON, E.C. Who are also Sole Makers of the celebrated "Granite Vitrified" Paving Bricks for Yards, Stables, and Footpaths, and "Granite Vitrified" Damp-proof Building Bricks, as used by H.M. Government for dock construction, &c. Samples free to Architects and Engineers.

BODIES.**  
The Sanitas Co., Limited, Bethnal Green, E.

# LINDSAY'S

## IMPROVED PATENT REVERSIBLE TREADS & LANDINGS

### FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

In Hospitals, or places where it is desirable to be free from dust, the blocks can be placed close together, not leaving any cracks, so that the treads or landings can be swept or washed quite clean; also, if it be necessary to get light under a Staircase or Landing, rough glass blocks can be fitted in the Iron frames, side by side with the wood, and a subdued light thus obtained.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be re-filled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works,

**13, 14, & 15 SOUTH WHARF, PADDINGTON, LONDON, W.**

The following Illustrations, which have appeared in "THE ARCHITECT," can now be obtained in a separate form suitable for Framing.

A Coloured Reproduction, by permission of

## THE ADMIRALTY COMPETITION.

NOW that people have had a little time to reflect upon the result of the "preliminary canter" in the pending competition, it is as plain as ever it was in any former contest that the majority of the competitors consider themselves to be very shamefully used. It is all very well for outsiders to laugh; they have laughed before and will laugh again; but the aggrieved parties protest that it is no laughing matter, and they ought to know. What these now say is that, whereas in previous competitions of this high order it has always been some sort of leading men in the profession who have taken the lead on the list, in the present case all the leading names, without exception (and it is said there were a good many), are struck off at the start, as if they were names of nobodies, and the approved designs (the judges, for some contemptuous reason, not even selecting the full number) are those of men who may be called unknown. Now we beg leave, while sympathising sincerely with all who are disappointed, to argue that this complaint is scarcely a reasonable one, and indeed that it is precisely what ought to be expected to arise in a thoroughly healthy competition—if a competition can ever be a healthy thing. This case, in short, seems to demonstrate once more, what was surely sufficiently proved at Glasgow, if not again and again before, that the special virtue of a great public contest of the kind must always be that it brings to the front, without respect of persons, those who could not have expected it, and whose success is therefore an accident, while it throws out with the same emphatic impartiality any number of those who made sure of victory, and whose failure is all the more deserved. Something like this is the very object of a competition—to pull down the mighty from their seats and to exalt the humble and meek; and if this kind of morality does not commend itself to the thoughtful and generous reader, we pray that he will be pleased to assign the blame not to us but to the system we are discussing. Commercially unsound from the beginning, it must be commercially unsatisfactory at the end; and, as only one can be the winner, there must always be an overwhelming majority against him.

But it is not only commercially that we ought to regard a great national competition; in fact it ought perhaps not to be entered into on commercial ground at all, but patriotically alone and for the sake of fame. One hundred and twenty-seven architectural designers, or special combinations of architectural designers in most cases apparently (for eight out of the nine selected designs in this case very significantly carry partnership names), have sent in their respective projects at the invitation of the Government; with what object in view? By the time they had pored and pondered over the problem of design for half a year, few of them could have been so foolish as not to perceive that the immediate reward they were contending for was the mere distinction of being placed on the list of recognised merit. Anyone can see that it might be good policy for quite half of them now to be content with the very considerable personal prestige they have gained, and to trouble themselves no more about a race where the odds against their final success are almost a certainty. Far be it from us to suggest that a retiring competitor in such circumstances has the opportunity of persuading himself and his admirers that only his own modesty has stood between him and the final victory; but it is an idea worth reflecting upon at any rate, as apparently a new element in the readjusted form of public competitions, that a prudent young man with little to do, who is not so weak as to believe that the Government and Parliament would ever entrust to him the control of a great national work because of his having produced an attractive set of drawings, has it in his power nevertheless to acquire a highly advantageous position before the world at large, by simply contenting himself with the honour of a share in these preliminary successes, possessing whatever value he himself may be pleased to claim.

The patriotic view of the question, also, is by no means to be overlooked. When one hundred and twenty-seven designs are presented gratuitously to the Government for a great public edifice, even from amongst "a nation of shopkeepers," it is no departure from the ground of strict common sense to say that many of the designers must have permitted themselves to be actuated to a great extent, and some of them altogether, by a direct desire to afford to a great national enterprise what help they might possibly be able to render, if only by a chance hit; in fact, the chance hit is manifestly one of the most important considerations in the theory of all such competitions of design. We hope, therefore, we may be allowed to claim this degree of credit for the disappointed competitors, and this consolation for them also, that they have responded to the call for the best design for a great national building most liberally; and no doubt we may be further allowed by all right-minded observers to suggest that the non-approval of so many projects submitted by architects of eminence is a proof of the great ability that has been brought to bear upon the competition generally, and perhaps of the extraordinary efforts that have been made by less eminent men, as represented by the work of the more successful competitors.

But there are two considerations which seem to be calculated to awaken anxiety. The first is the rumour that the ground upon which the selection of the nine designs has been made is their accidental accordance with a previously approved model of arrangement for the plan. It is further supposed to be probable that the officials of the Office of Works had actually prepared a definite design of their own on this basis before the competition was instituted. Without attaching any great importance to such suspicions, we may at any rate remember what was done at Glasgow, and what was so much complained of in consequence. In that instance, it is true, the plan which had been designed by the surveyor to the Town Council under their instructions was frankly published, and a copy supplied to each competitor. It would be mere flattery to say that it was in itself a bad plan, for it was a very bad plan indeed. But it became clear enough in the end that the general disposition as thus suggested was in fact settled beforehand; and, to make a long story short, it is alleged that the design eventually selected as the best in absolute merit was simply the cleverest conversion of Mr. CARRICK's project into feasible form, a result which in such circumstances is more likely than any other to take place. In the case of the present Admiralty competition it is broadly asserted that the one hundred and twenty-seven sets of drawings, or so many of them as were worthy of any consideration, were without difficulty divided into two classes with reference to a certain fundamental principle of arrangement settled beforehand, and that the nine fortunate ones were merely those which constituted one of these classes, the whole of the rest constituting the other. It is not that we venture to object in any way to this summary mode of dealing with the problem practically; we are quite ready to believe, if so assured by Messrs. CHRISTIAN & HARDWICK, that it was the only way to deal with it; but when the rejected competitors argue that this implies a sort of *suppression veri* in the conditions of competition, what is the answer?

The second point to which we have to refer is what appears to be a degradation of the transaction to the low level of the reception of so many tradesmen's tenders. Nothing, we submit, can in any case redeem a high class public competition of architectural designs from this charge except an exhibition of the designs before the adjudication is made. Whatever may be the inducements to preserve secrecy, they cannot be of any consequence to the object which the promoters of the competition have in view, namely, the obtainment of the most advantageous design that can be got; and it is an accepted constitutional principle in all our public affairs that publicity is the best safeguard against unfair dealing, whether intentional or unintentional. In the great competition of 1857 for the Government Offices in Whitehall, the designs were publicly exhibited for a considerable time, and the criticisms of the press were allowed to be published without reserve. Not only so, but the authorship of most of the best designs was openly identified. Nevertheless—let us say, indeed, in consequence of all this—when the adjudication was at last made, although private disappointments were many, the result was accepted with very little, if any, objection, and, wherever it was found to be at variance with public expectation, a sufficient reason soon became discernible. To refer again to the Glasgow case, we need

scarcely remind the reader that Mr. BARRY was credited with having adjusted the arrangements so as to suit the express purpose of avoiding criticism; and we submit that this, however convenient for the judges, is most dangerous to the cause, if not, indeed, in a certain sense, wanting in courage, courtesy, and honour. The interested public and the competitors have had no means of satisfying themselves to this day of the superiority of the accepted design over the others, and this notwithstanding the very unusual circumstance that the adjudicators, as they actually said in their report, had no difficulty in selecting it, even at the preliminary stage, as the one of super-eminent merit.

The next time we have a great competition, might it not be worth while to try the principle, if only as a good honest "English" principle, of unreserved and uncompromised publicity? Let every drawing be plainly signed by its author, and let the whole collection be openly exhibited, and we venture to think public criticism will take care of all the rest, whatever may happen. In the present case we should be disposed to advise Mr. SHAW-LEFEVRE to accept the risk of exhibiting the whole collection of designs at once, with the authors' names appended; and even if it should become necessary in consequence to revise the selection—a result which we have not in our mind at all—what would be the harm?

### THE METROPOLIS GOVERNMENT BILL.

THE Bill introduced by Sir WILLIAM HARCOURT for the municipal government of the metropolis has been drawn with no small skill; for, while seeming to disturb but little, it is calculated in reality to effect enormous changes. It was always understood that the aim of the measure would be the constitution of one vast municipality for the whole metropolis, and that the creation of a series of distinct authorities would not be advocated, and this is the shape actually taken by the Bill. The three million eight hundred thousand people within the limits of the present Metropolis Management Act might easily have been formed into several corporations, each embracing interests as large as those of a first-class provincial city; but the expediency of such a step, and its advantages and disadvantages as compared with the erection of a single municipality are not what at this moment we propose to consider. The Bill proposes, as we have said, to embrace all London under one Corporation, and seeks to appear to do so by expanding the ancient Corporation of London, and not by ostensibly destroying every existing organisation and making a fresh start. The Metropolitan Board of Works which, it is true, has not the prestige due to ancient establishment, though it well deserves the credit of having done excellent public work since its creation in 1855, is to be superseded, or perhaps it may be with more accuracy said, is to be swallowed up; and the aldermen of the City of London are to disappear. Nor is the list a short one of the public bodies whose duties and attributions it is proposed shall be absorbed by this municipality. Still, there is to remain a Lord Mayor and a Common Council; and, at the first blush, the general feeling has been that the measure was not so revolutionary as had been anticipated. A closer examination will hardly justify this opinion, as we shall endeavour to show.

The body proposed to be created, if in name the same as the Common Council of London, is to be in nature neither the Common Council nor the Metropolitan Board; nor any fusion of them, but a totally new body, elected in a different manner and likely to be animated with a different spirit. Upon this body is to be cast the duty, among other things, of introducing Bills into Parliament to effect those many reforms (not to say revolutions) with which the Home Secretary is too prudent to burden his measure, but which he is anxious to see introduced. No more revolutionary policy, however conservative in appearance, can be in reality thought of or proposed than first to create a new broom and then to commit the wide area of London to its tender mercies, to be swept as clean as it sees fit. We believe that the apparent moderation of the Bill, with these provisions attached to it, is more formidable, and foreshadows a larger measure of ultimate change, either for good or for evil, and calls for closer scrutiny than would have been needed by such a Bill as it was in many quarters anticipated would be brought in by the Home Secretary.

The limits of London for the purposes of this Corporation

are to be those of the Metropolis Management Act, and the new municipality is to consist of 240 common councilmen elected by the burgesses, and to hold office for a period of three years. The School Board for London probably presents some idea of the class of members who will be obtained under this system, and its debates and methods of management may give some clue as to those which will prevail in the new Common Council. We may hope that the disturbing elements which have been so prominent in the School Board discussions may not present themselves in this new council chamber; and we may hope also that the steady deterioration which careful observers have detected in the School Board at each triennial election, may not have to be apprehended in the case of the London Council; but there appears reason to suppose that the same causes which have tended to diminish, at each election, the number of first-class men willing to occupy seats on that board, or able to secure them, are not unlikely to operate in the case of this new London Parliament.

There will be a Lord Mayor and a deputy mayor, but no aldermen; and the abolition of these influential persons will assimilate the working of the new Corporation to that of the Metropolitan Board rather than to that of the present Corporation. This change is to be regretted; if for no other reason because it will do away with a valuable means of attracting men of ability and experience of affairs to take part in public business by abolishing an office of great honour to which they could aspire. Into this Council, elected by popular vote, and of which all the members are to have equal rank, will be merged *inter alia* the powers of the present Corporation, the Metropolitan Board of Works, all Vestries and District Boards, Paving Commissioners, Burial Boards, Commissioners for Baths and Washhouses and for Public Libraries, and the administrative powers of the Justices of Middlesex, Surrey, and Kent, and of the City Commission of Sewers. There are, however, to be what are called District Councils, which will, in effect, perform some, if not most, of the duties now assigned to District Boards and Vestries.

A kind of interim council of 240 members, to consist of the existing 46 members of the Metropolitan Board, of 44 members elected by the Common Council, and of 150 elected by the general body of burgesses, is to make arrangements for the transfer of London from the existing authorities to the new ones; and probably this transitional body, which will act as a sort of introduction of individual men to the new constituency, has been proposed with a view slightly to disarm the apprehended opposition of the members of the Metropolitan Board.

As has been stated already, when this unwieldy Corporation is once constituted, the duties cast upon it by the Bill will include dealing with new matters of the utmost importance, as well as with ordinary municipal work; and in this respect Government is only following the precedent set by the establishment within the House of Commons itself of grand committees, upon whom work can be devolved which—at present, at any rate—the House itself cannot undertake.

It appears that the Common Council is to be required to submit Bills to Parliament for, among other purposes, the purchase and regulation of London waterworks and gasworks, or the provision of a new supply of water or of light, for the regulation of cabs and omnibuses, and for the abolition of the Irish Society; and they may, without recourse to Parliament, make alterations in the limits of London, in their own constitution and duties, and apparently in almost every matter of interest entrusted to them, by means of schemes; and such schemes, when approved by the Local Government Board or the Secretary of State, and confirmed by the Queen in Council, will then acquire the force of law.

There can be no kind of question that a series of delegates elected by popular vote, and whose proceedings will be reported in the newspapers, will be anxious to justify their own existence by doing something; and, as pulling down is a great deal easier than building up, there is little doubt that many of the existing methods of carrying on public work, which by lapse of time have become well adapted to the purposes which they have to perform, will be in danger of being changed, superseded, or abandoned with, at least, doubtful advantage. We see, for example, nothing in the abstract of the Bill which directly affects the status of the district surveyors, but there can be no doubt that it will be competent for the new Board to propose, and by means of a "scheme," to effect changes in their qualifications or remuneration or duties, such as might

entirely alter the administration of the Building Act ; and, if this were done, the effect of the alteration might, and probably would, be felt by every builder in the metropolis, as well as by every present and future district surveyor. In the same way the obligation laid upon the Corporation of dealing with not only the water supply—in respect of which there has been much complaint—but the gas supply—in respect of which there has been none—will no doubt tend to point out to the more adventurous spirits the gas and water companies and their undertakings as objects of early attack. These will be dealt with in the first instance not in the old-established and well-understood Parliamentary manner, but by a public body guided by no precedents, and having as yet no settled mode of procedure ; and a measure may well be brought up to the House of Commons, the merits of which have not been properly sifted, which will enjoy the advantage of being held to be a public Bill, and in favour of which the very considerable weight due to the source from which it will originate cannot fail to tell, perhaps unduly.

The magistracy of London are to be put under the new Corporation, and among the proposed changes is one which seems important. Four Deputy Recorders are to be appointed, and two of them are to sit for the purpose of hearing appeals from Courts of Summary Jurisdiction. If this means appeals from the Metropolitan police magistrates' decisions, we cannot doubt that a considerable proportion of such appeals will rise out of cases in connection with buildings, and especially in connection with the Metropolitan Building Act. The greater part of the time of one such judge (who ought to have a skilled architect and surveyor as his assessor) might well be devoted to such cases, and if the judge were one of the few barristers who understands buildings and building law well, and his assessor a man of good practical experience, the establishment of such a court would be hailed as a boon by very many of those engaged in building operations in the Metropolis. A magistrate for building act cases, who would take the pains to understand them, and whose decisions should establish a consistent series of precedents has long been desired. If Sir WILLIAM HARCOURT'S measure shall give us this, or something like it, we shall be grateful.

In conclusion we must point out that if this Bill becomes law in its present shape, the responsibility and the powers of the professional advisers of the Corporation will be even heavier than they have yet been, and the necessity for securing the services of the best architect, the best engineer, the best solicitor, the best counsel, who are to be had for money will be greater than ever before. The Corporation and the Metropolitan Board have been both of them extremely well served. They have been able to secure the services of excellent officers, and have been obliged to commit a vast amount, not only of the detail, but of the principles of their public work into their hands. In the future a far larger, and consequently less handy, body than either of these two will have to assume and do its best to discharge, not only the functions which have been discharged by both the above-named great corporations, but by an enormous number of smaller bodies ; and if it is eager to try its skill with regard to water supply, and do that which the late Government failed to accomplish and the present Government has hesitated to attempt, it will certainly have its hands full. The circumstances of the case will cause a vast amount of detail to be relegated to committees, but the bulk of it will remain to be dealt with by the permanent officers ; and the result will necessarily be that the Corporation will require the aid of officials of the soundest judgment and the greatest capacity if its work is to be done at all. A guarantee that in this respect, however, the administration is not likely to be at a loss, unless it be from *embarras de richesses*, occurs in the fact that all the existing officers of the Metropolitan Board and of the old Corporation are to become officers of the new Corporation, which, however, is to have the fullest powers as to their appointments, duties, salaries, compensations, &c. There are at present in London not a few of what may be called duplicated offices. The two official architects, for example, Mr. HORACE JONES and Mr. VULLIAMY, or, again, the two engineers, Sir JOSEPH BAZALGETTE and Mr. HEYWOOD, are at present discharging very analogous duties each for the body under whom he acts ; and one of the difficulties which will have to be encountered, and requiring most delicate handling, will rise out of the necessity for recognising these double appointments, and properly defining the double sets of duties that are connected with them.

We have, of course, only touched upon the fringe of this great subject ; but we hope we have shown that, large as are the changes obviously introduced, those which may be expected by implication to follow are more extensive still. Among our readers but few can feel sure that this is a subject which may not indirectly affect themselves, however little there may be at this moment the appearance of its touching their interests or occupations ; and all who take any pride or pleasure in the metropolis of England must feel that Sir WILLIAM HARCOURT'S proposals not only merit but demand the closest scrutiny—such scrutiny which should be the more jealous because the institutions which it is proposed to supersede are at present doing the work of this metropolis in a manner which we believe will compare not unfavourably with similar work in any capital in Europe or, we may add, America.

## STUDIO NOTES.

AFTER completion of a work so elaborate and extensive as the *Anno Domini*, Mr. LONG, R.A., has of course no important picture ready for this season. But the three studies of Oriental beauty, on which he has bestowed careful manipulation, of a somewhat more solid kind than is often his wont, will commend themselves by the same sensuous grace and rich accessories that have heretofore won popular favour. The subject-title assigned to these figures does not really affect them more than the fancy names that used to be bestowed on ladies of title by courtly portrait painters in the days of REYNOLDS, or by the French WATTEAU or BOUCHER. Or, to come nearer the mark, Mr. LONG'S figures are typical rather than individual ; just as one may see a MIRIAM, an ESTHER, or a VASHTI any day in a Jewish colony, or a CLEOPATRA or ZENOBIA by the waters of the Nile. The painter's types are, however, genuine *pur sang* ; he does not produce a negro from a Christy Minstrel, or an Assyrian belle from a London model.

That favourite among animal-painters of the day, Mr. BRITON RIVIERE, R.A., will be very strong in a large picture of the king of beasts—a truly regal lion standing proudly indifferent amidst a throng of fawning and yelping jackals. The too human touch which so constantly turns character into caricature in the treatment of animals, has been artistically restrained here, and this beast, though “every inch a king,” is still true to his quadruped nature. The picture naturally comes into competition with the less schooled but energetic work of Mr. NETTLESHIP, in last year's Grosvenor, the blind lion at the edge of the precipice, with the jackals behind him. Mr. RIVIERE has also a fresh version of *The Magician's Doorway*, and other less notable work.

To turn to the studio of Miss EVELYN PICKERING is an abrupt change. This clever disciple in modern Mediævalism does not alter her style. Her chief picture for the Grosvenor Gallery is a subject from the Italian poet, to the effect that, with Old Age creeping into view, and Death a dread shadow chilling the blood, it is best to love while the blessed moment is with us. So here a pair of lovers gaze into one another's eyes with a pathetic kind of passion in the presence of Love, while far away in the distance we see a figure bent by age and sorrows, and behind it a ghostly impersonation of Death as a female, with huge wings feathered like a bird, and the fatal scythe in hand. A landscape with winding river, cypresses, and volcanic rocks, reminiscent of Italy and of Tuscan back-grounds, fills up the picture. Miss PICKERING'S figures are still attenuated, angular, and languid, depending upon the expression thrown into attitude, the beauty of extremities, and the yearning, passionate type of countenance ; depending also upon draperies cast with exceeding care in the lines of the figure, and coloured with the rich but subdued isolated tints in which this young artist excels. Her colouring is indeed exceptionally good, lustrous with a sombre splendour, and varied in harmonious appositions. She belongs to a school of mannerism and has no claim to originality of mode, but her sense of design is often strikingly fine, and her power of expression concentrated and intense. She has ready for a forthcoming exhibition of selected pictures at the Fine Art Society's Gallery, a small picture of the *Visitation*—avowedly an imitation of Florentine models—very good in colour. Certain single-figure studies, done with gold point upon purple ground, show the artist in her most original and artistic vein.

Both in dignified conception and firm hand these drawings might be worthily entered in a folio of "old masters." Finally, for the Grosvenor Gallery is a life-size terra-cotta bust study of a *Mater Dolorosa*, executed in a large manner, the drapery about the head finely cast, the face itself of a type somewhat in the tenderer BUONARROTI mould, as in some heads on the Sistine ceiling, or the *Madonna* at St. Lorenzo in Florence, but with a wistful sorrow that is of modern thought. Were it not that this earnest young painter has strength in colour, we have often wished she would give her work to sculpture, to which her sense of design and feeling for line, both in form and drapery, fits her especially.

The clever group of artist sisters, the Misses MONTALBA, are ready with pictures and sculpture. CLARA MONTALBA, the head of the group, has subjects from the watery world of Holland, Venice of the North. In the Whistlerian phraseology, one is an adagio in grey, and the other a cantilena in gold. Holland has drawn the sympathies of the artist, but for all that she is off to Venice again, about which she has not yet said all she has to say. The portrait painter, ELLEN MONTALBA, has a charming upright study of her sister, HENRIETTA, in cream evening dress against a golden background, with her dark hair hanging in a long plait down her back; also another portrait of a lady in a dress of deftly painted soft flame-coloured satin. HILDA MONTALBA has enlarged the sketch of Swedish marsh-land and water under suffused sunset glow, which we noted with admiration in the winter exhibition at the Dudley Gallery, and has painted therefrom a picture of fine gradations and atmospheric quality. The terra-cotta bust of *Robert Browning* by HENRIETTA MONTALBA may be considered successful. It is finely and crisply modelled, but just a little *posé*. One or two female busts have much character and charm.

The prospects of sculpture for the Academy do not seem very promising. Mr. MACLEAN has not finished his figure after TADEMA'S *Spring*. Mr. SIMONDS cannot give us a *Perseus* every year, and has been busy upon his colossal lion for America. Probably a chief point will be made by the fresh start of Mr. HAMO THORNEYCROFT, R.A., who, forsaking classic and scriptural ground, now comes forward with the heroic in rustic life. A life-size figure of a mower, with his scythe slung behind him, is the chief work of the young Academician. The French have done this sort of thing for some time, and done it well, and Mr. THORNEYCROFT'S figure shows the influence of the French school. But it is none the worse for that; the modelling of the bared portions of the figure, muscular arms and chest and throat, and well-formed solid head, is energetic without exaggeration; the difficulties of costume, shirt and trousers and shadowing hat, are so admirably managed that it does not occur to one to remember such garments have been held not fit for plastic treatment. Of course a realistic figure of homely occupation must attain the picturesque rather than the sublime; nevertheless, by a certain simplicity, largeness, and nobility, this mower of Mr. THORNEYCROFT distinctly belongs to the heroic, just as FRED WALKER the painter's peasants and gipsies did. The Greek athlete and the Cornish sailor might exchange occupations, and be found ready to the sculptor's hand in either. The occupation is an accident, of which the beauty of developed strength and endurance in the human form is independent.

### PARIS NOTES.

MANY painters, who have either not sought or have sought and failed to obtain admission to this year's Salon, have determined to hold a free exhibition of their own, open both to works of painting and sculpture. A meeting in furtherance of this project was held at the Salle Montesquieu, on Wednesday evening, when a committee was appointed to organise the affair, and receive subscriptions towards carrying it out.

The Museum of Casts, lately organised in the Trocadéro, under the management of the Committee of Historical Monuments, is to be considerably enlarged. This collection, which is devoted exclusively to the illustration of native art, has been hitherto confined to reproductions of works of the twelfth to the sixteenth century inclusive. At a meeting of the managing sub-committee, held on Monday, under the presidency of M. Antonin Proust, ex-Minister of Fine Arts, it was decided to establish immediately

fresh galleries for the seventeenth and eighteenth centuries. Among the orders already given for this new section of the museum are those for casts of all the decorative sculptures of the Versailles Gardens, of the fronton of the Hôtel de Rohan—now occupied by the National Library—as well as reproductions of all Houdon's busts.

On Saturday last the vote for the Salon jury in the section of sculpture, medallion engraving and jewel engraving took place at the Palais de l'Industrie. The polling, presided over by MM. Etienne, Leroux & Thomas, lasted from ten to four. According to the regulations, the jury must be composed of thirty members, comprising twenty-four sculptors of statues, two of animals, three medallion engravers, and one jewel engraver, with five supplementary jurors. The voting-body consists of all artists that have submitted exhibits in the sculpture section, and three hundred and fifty-nine were found to have exercised their right of suffrage. In addition to the lists recommended by the Association des Artistes Français and the Société Libre des Artistes, seven or eight independent lists were also put forward; but in the main the candidates recommended by the first-named body were successful. The following were the results of the voting:—*Statue Sculptors*—MM. Mathurin Moreau, 274; Paul Dubois, 257; Chapu, 246; Dalou, 245; Barrias, 224; Schoenewerk, 222; Captier, 214; Mercié, 213; Falguières, 207; Guillaume, 201; Thomas, 198; Aimé Millet, 176; Etienne Leroux, 175; Saint-Marceaux, 169; Idrac, 167; Doublemard, 163; Gauthier, 159; Marcellin, 154; Thabard, 150; Cavelier, 148; Hiolle, 147; Gauthier, 140; Delaplanche, 135; and Alasseur, 120. *Animal Sculptors*—MM. Frémiet, 220; and Cain, 217. *Medallion Engravers*—MM. Dubois Alphée, 188; Levillain, 164; and Degeorge, 123. *Jewel Engraver*—M. Galbrunner, 146. *Supplementary Jurors*—MM. Vaudet (jewel engraver), 117; Blanchard, 116; Boisseau, 114; Truphème, 111; and Guilbert, 103 (sculptors).

The subject given by M. Jules Thomas, on behalf of the Académie des Beaux-Arts, for the first section of the second stage in the competition for the Prix de Rome in sculpture is a modelled sketch of *Pandora dowered by the Gods*. The second section of this stage consists in modelling a nude figure from nature, and in their choice of the ten artists admitted to enter *loges* for the final the jury have to take into account the merits of both works of each competitor.

The Roman amphitheatre in the Rue Monge, the site of which had been purchased by the Municipal Council, is being gradually brought to light. The southern portion of the arena and *podium* may be said to be completely cleared, and the labourers are now pushing forward the excavations near the stage. From the construction and arrangement of the building, it was evidently used both for theatrical performances and wild-beast fights. Last week part of the steps near the *vomitorium* were discovered. It is hoped, moreover, that when the arena is entirely cleared many vases, coins, and arms may be found.

Photographs of the buildings about to be demolished to make way for the Rue Etienne-Marcel, a new thoroughfare, have been taken by order of the Prefect of the Seine. Three different views were obtained of the Place des Victoires, two of the Rue Pagevin, two of the Rue de la Justice, and one of the Rue d'Argout, while the celebrated Rue Tiquetonne will be taken from several points within a few days. The same measure is henceforth to be applied to all old buildings condemned by the City for improvements, and the collection of views thus obtained cannot fail to be of the greatest interest and aid to Paris archaeologists and historians.

The Prefect of the Seine, in accordance with a resolution of the Committee of Public Inscriptions, has given orders that a tablet shall be placed over the entrance to the Paris Chamber of Notaries, bearing an inscription which may be translated:—"On this spot stood the Grand Châtelet, the former fortified gate of the City, seat of the Paris Provost and of the Corporation of Notaries."

The frequency of inundations on the Seine during the winter months has impelled the riverside population of Charenton, Sory, Maisons Alfort, Alfortville, &c., to form a committee charged to

study the best means of preventing their recurrence. A local engineer, M. Gohierre, has submitted a plan for the cutting of a canal from the Marne to the Seine, between Champigny and Epinay, as a means of carrying off the surplus water in the latter river.

The last few sittings of the Municipal Council, prior to the date fixed for the general election by which it is to be renewed, will be entirely devoted to the examination of various schemes of City works, among which, both on account of its importance and of the probability of its being adopted, may be particularly mentioned the projected series of local improvements, comprising an extension of the Halles Centrales, the establishment of a produce exchange adjoining the Corn Market, and the prolongation of the Rue du Louvre between the Rue St.-Honoré and the Rue Coquillière, the whole of which would necessitate an outlay of 25,000,000 frs. Towards this sum, however, the Paris Chamber of Commerce are prepared to find no less than 16,000,000 frs.

Gustave Doré's statue of Alexandre Dumas the Elder, which was unveiled last November on the open space of the Place Malesherbes, at the junction of the Boulevards Malesherbes and Courcelles with the Avenue de Villiers, has been formally presented to the City of Paris by the committee that raised the subscriptions for its erection.

One of the wings of the well-known Château de Fervacques, in the department of Calvados, suddenly gave way and fell with a crash during the night of Saturday last. The mansion was built in 1552 by Guillaume de Hautemer, Marquis de Fervacques, and belongs at present to the Comte de Montgomery.

The visits to the Paris sewers were begun anew on the 16th inst. Entrance can be obtained only by special permits from the Prefect of the Seine. Four trips a day are made from the Châtelet to the Madeleine, and *vice-versa*, 88 persons only being admitted at a time, thus making a maximum of 352 visitors a day. The average number of applications for tickets every year is 35,000, out of which only 4,500 can be granted.

One of the historic monuments of Paris, the Porte St.-Denis, is at the present moment in a very bad state of repair, portions of the fine bassi-relievi and other ornamental work being literally crumbling away. It seems almost incredible, but it is nevertheless true, that the fact of the edifice being crowned with the statue of the Grand Monarque is likely to stand as an obstacle to its immediate repair. The Municipal Council objects to the outlay of money on anything monarchical, even though it be the monument of a glorious period of national history. The St.-Denis arch was erected in 1672 by the City of Paris from the designs of Blondel, and in commemoration of the conquests of Louis XIV. The only inscription is the words "Ludovico Magno" on the principal façade. It is to be hoped that a compromise may be arrived at with the Council, whereby the king's statue might be relegated to some museum as a sacrifice to the fervid Republican zeal of that body, which would then give orders for the restoration of the remainder of the monument.

Experiments with a new kind of fire-escape, the invention of a M. Robert, were carried out on Sunday last on the Place Baudeyer. The apparatus in question consists of a metal ball, which can easily be hooked on to a window. This ball contains a belt to be adjusted round the body and fastened to a long rope; the end of a second rope is held firmly in the hands, after which the person can jump from the window. By the means of a kind of brake arrangement, the body can be lowered into the street at more or less speed, or the descent can be checked altogether. In the trial made on Sunday seventy-six persons descended from a fourth floor by means of the apparatus. At one moment a panic was simulated, when fourteen persons, including men, women, and children, lowered themselves in twelve minutes—one man stopping in his descent at a second-floor window, whence he rescued a woman and child.

A New Workhouse is to be erected for the Tynemouth Union, North Shields, but the competition for designs has been postponed until after the election of the new Board of Guardians.

## CASTLE VIANDEN, LUXEMBURG.

"THE twelfth and thirteenth centuries—period of the finest blossoms of the Romaic, and buds of Gothic architecture—fashioned this Colossus, and adorned its parts with the pure charm peculiar to themselves, so that one is undecided whether most to admire the imposing grandeur of the whole design, or the inherent living elegance of the ornaments, that unfold themselves, full of meaning, as they lie strewn around." Thus wrote the German archæologist Reichensperger, of the impression made upon him by the ruined castle of Vianden, within eight miles of Diekirch. And, indeed, this picturesque and historical work has greater attractions for the artist and the archæologist than any other of the many points of interest in the Grand Duchy of Luxemburg.

Surrounded by lofty and solid walls, flanked by twenty-four towers, mostly semicircular, and with six gates guarded by portcullis, the town of Vianden was an important stronghold in the Middle Ages—indeed, next to Luxemburg itself, the most important in the Grand Duchy. In its midst, on a rocky escarpment 850 mètres above the river Our, rose the ancient castle of the powerful Counts of Vianden. From whatever side the visitor beholds the ruins of this imposing fortress, they present a grand aspect, being set, like a gem, in a site on which Nature seems to have lavished all her picturesque effects. From the terraces a charming view is afforded over the valley of the Our. The principal street is arranged round the castle, with which communication was formerly gained by a subterraneous passage. Closely examined, these ruins present many peculiarities of the highest interest to the architect, the historian, and the military engineer. Everything recalls the great feudal power of its seigniors, who for ages were only dependent "on God and the sun," to use a favourite expression of these sovereign lords who had vassal nobles in their train.

Additional lustre attaches to the noble House of Vianden through its fusion, in the fourteenth century, with the House of Orange-Nassau, now reigning in Holland. In 1351 the heritage descended to Adelaide, one of the sisters of the last Count, who had married Count Otho of Nassau. Their son, John I., sat in the Assembly of the States-General, 1444, at which Philip of Burgundy was proclaimed Duke of Luxemburg. Engelbert, great great grandson of John, was Governor of Luxemburg in 1483, but, dying without issue, he was succeeded in 1489 by his brother, John III. William I., son of the last-named, was the father of William the Taciturn and of John IV., from whom is descended the present King of Holland, who is also Grand Duke of Luxemburg and Count of Vianden.

The castle is now the property of the heirs of Prince Henry of the Low Countries, who was, with his wife, the Princess Amelia Maria da Gloria of Saxe-Weimar, greatly beloved in Luxemburg, where he was the Grand Duke's representative. The chapel of the castle has been partially restored; and the restoration has given rise to a lively discussion between the architect and Victor Hugo, who is a great admirer of these ruins.

For twenty-five years the castle of Vianden has been the subject of patient and minute study by M. Charles Arendt, the State Architect, who is about to publish, by subscription, a magnificent work, illustrated with nineteen plates, the dedication of which has been accepted by King William III. of Holland. Its scope is set forth in the report of the Historical Section of the Grand Ducal Institute as follows:—The work consists of three parts, of which the first comprises an architectural description, the second an historical notice, and the third an album of plans and views of Vianden. In the second part the author briefly sketches the history of the Counts and of the castle from the earliest times until the present, all the details being derived from the most trustworthy sources. The first and the third parts are quite new. This is the first time that the castle of Vianden, the construction of which presents so many points of interest, is thus examined by an expert. We are of opinion that the author has attained his object. Not only does he describe all the parts of the ancient castle, and its works of defence, but he also makes us participate in the construction of the sumptuous edifice by pointing out from what century date the chapel, the towers, &c. We are persuaded that this portion will secure the approval of all connoisseurs. But it is the album which especially captivates the attention. We are shown in turn the principal views, the marvellous sites in which this ancient Vienna\* abounds, the architectural beauties, the plans of the castle, and the most remarkable monuments of the old courts, all the views being faithful and admirably executed. This is signed by the president, M. Wurth-Paquet, and the secretary, M. Van Werweke; and Victor Hugo has also shown high appreciation of the work.

\* It is thus that Vianden is named in the old charters. M. Arendt has added to his work a supplementary plate giving facsimiles of two old charters—one of Yolande, 1271, with seals of the prioress and of the convent of Marienthal, *Vallis Sancta Maria*, and the other of Philip, 1262, with seals of the Count and Mary his wife.

## THE NEW YORK CITY HALL.\*

AT this time, when architecture is being revived in America as an art rather than practised as a trade, attention is being drawn to the excellence of some of our public buildings erected in the last century or about the beginning of this; when, fortunately, the purity of style in architecture maintained in England, especially by Sir William Chambers and certain of his pupils and others, was gaining a footing in this country, and was taking shape in the New York City Hall and some other buildings of the time. If what is said here helps to fix attention upon these old buildings, and to stimulate efforts for their preservation, the object of the writer will have been attained.

When the City Hall was first occupied, in 1811, it had for its nearest neighbours the bridewell close by on the west, the almshouse behind it, and the gaol, which was made over into the present Hall of Records. From the portico of the City Hall there was an unbroken view down Broadway, including St. Paul's, the little odd shops that occupied the site of the *Herald* building, the wooden spire of Trinity, and the cupola of Grace Church. Now the post-office shows its ugly back to its classic neighbour, and, on the northern side, the new court-house has been built on the site of the almshouse.

To tell the story of the building of the City Hall in all its details would be impossible here. From corner-stone to parapet it was more than ten years under way. Many a modern settlement has grown to cityhood in less time. The labours and dangers, constructive and financial, connected with it, rivalled those of carrying the gods to Latium. May 26, 1803, the corner-stone was laid in the south-east corner by Edward Livingston, then mayor of the city.

The preceding three years had been spent by the Corporation in the endeavour to settle upon a plan that would be acceptable to all. On March 24, 1800, they had appointed a committee to consider the expediency of erecting a new hall, and to report their opinion as to the proper place, with a plan of the building, an estimate of the expense, and suggestions for the disposal of the old City Hall. In accordance with this resolution, the committee offered a premium of 350 dols. for a plan and elevations of the four façades. From among the plans so obtained one was selected and adopted by the aldermen, October 4, 1802. On the 11th of the same month the Common Council appropriated 25,000 dols. toward carrying it out, and appointed a building committee. Opposition to the undertaking now developed itself through a dilatory resolution offered to the Common Council, December 27. It was ingenuously worded and called for much detailed information. The hope of its promoter was to create dissatisfaction with the adopted plan as being too ornate, too expensive, and larger than the city required. Under the pressure thus brought to bear, the committee, although fully intent upon the use of marble, on February 21, 1803, reported estimates of the cost of using marble and of using stone for the front of the building.

They advised the Common Council that the plan might be somewhat curtailed, especially in the projecting wings, but were unanimously of the opinion that it was advisable that the hall should be built in accordance with the adopted plans, with the exception mentioned; that the front should be of Stockbridge marble, the sides of Morrisania or Verplanck marble, and the rear of brown stone.

This report was rejected, and at the meeting of the Common Council a week later it was ordered that the committee should be discharged and a new one named, to consist of a member from each ward of the city. Aldermen Oothout, Van Zandt, Brasher, Barker, Minthorne, Le Roy, and Bogardus were accordingly appointed. All persons employed by the late committee were discharged, and the moneys remaining in their hands were paid over to the city treasurer. The new committee immediately re-appointed Mr. McComb architect, and fixed his pay at six dols. a day for each and every day he should be engaged upon the building.

I have had access to Mr. McComb's papers, which still remain in his family, and which include the original designs, a great part of the working drawings, the diary that he kept pertaining to the building, his accounts of marble, correspondence, &c. Many of the books of his library also remain, and through them one may trace the sources from which he had collected much of the information that enabled him to execute a work which, so long as it stands, will continue to be admired for the purity of the design and the elegance of its execution. It was probably in anticipation of the change which was to take place in the committee that the architect had been instructed on March 10 to make out a plan on a reduced scale, by taking away three windows from the extreme depth of the building, two of them to come away from the depth of the end projections of the main front; and by shortening the length of the building by taking out two windows, and to make estimates accordingly. The reduced plan and estimates were at once furnished, with the information that, should brown stone be used, the cost, exclusive of statuary and bas-relief, would not exceed

200,000 dols. On the 18th of the same month the new Building Committee met at the almshouse, and determined "that the reduced plan for building the new City Hall presented by Mr. John McComb should be adopted; that the front, rear, and ends be built of brown freestone; that the said building be erected on the vacant ground between the gaol and bridewell; that the wings, in front, range with Murray Street, on a parallel line with the fence in front of the almshouse."

On the 21st the committee reported their action to the Common Council, and the plan and estimates above referred to, with the assurance that they had "endeavoured to combine durability, convenience, and elegance with as much economy as the importance of the object will possibly admit of." This report was at once confirmed, and 25,000 dols. placed at the disposal of the committee, with instructions to proceed with the construction of the hall with all expedition. During this time Mr. McComb had been indefatigable in his efforts to induce the committee to return to the original plan with the use of marble as the building material; and on April 4 they so far relented as to express to the Common Council their doubts as to the propriety of diminishing the length by leaving out two windows of the front. Fortunately, the Common Council seems to have been similarly impressed, and ordered the original dimensions of the front to be restored. Discussion as to the dimensions of the plan then ceased, for under date of the following day Mr. McComb's diary contains this entry:—

"April 5.—I marked out the ground for the building, and the cart-men began to dig for the foundation. Previous to this the Corporation resolved to have the length of the building agreeable to the original design of 215 feet and 9 inches, but insisted on its being reduced in depth as they had directed in March. Reducing the projections in front, I readily agreed to; but cutting off the depth of the building, I contended, was a very bad plan, as it spoils the proportion of the large court-rooms and cramps the whole of the work, but no arguments could prevail. Several wished to cut off the projection in the rear, and two of the committee insisted that the north front had better be built of blue stone."

Steps were taken to procure the brown stone determined on as the material to be used from New Jersey. A quarry at Newark was leased, and arrangements were made to procure more from Second River. Notwithstanding the unhealthfulness of the city, the construction does not seem to have been retarded, for in the fall of the same year the foundation had been carried to the top of the basement window arches, at a cost of some 46,000 dols. Meanwhile the views of the committee seem to have been again enlarged, for on September 3 Mr. McComb records that he found some of the members of the Common Council in favour of white stone for the principal fronts, and that he was then requested to estimate the additional cost of the use of marble for the three fronts. The estimate was furnished and reported to the Common Council. The report was made in October, and included the following argument in favour of a more liberal expenditure:—

"It appears from this (the architect's) estimate that the difference of expense between marble and brown stone will not exceed the sum of 43,750 dols., including every contingent charge. When it is considered that the city of New York, from its inviting situation and increasing opulence, stands unrivalled; when we reflect that as a commercial city we claim a superior standing, our imports and exports exceeding any other in the United States, we certainly ought, in this pleasing state of things, to possess at least one public edifice which shall vie with the many now erected in Philadelphia and elsewhere. It should be remembered that this building is intended to endure for ages; that it is to be narrowly inspected, not only by the scrutinising eyes of our own citizens, but of every scientific stranger, and in an architectural point of view it, in fact, is to give a character to our city. The additional expense of marble will be fully counterbalanced when we recollect that, from the elegance and situation of this building, the public property on the Broadway and Collect will much increase in value, and that the same influence will be extended to property far beyond these limits, and that in the course of a very few years it is destined to be in the centre of the wealth and population of this city. A building so constructed will do honour to its founders, and be commensurate with our flourishing situation. Under these impressions the Building Committee strongly recommend that the front and two end views of the new Hall be built with marble."

The report is in Mr. McComb's handwriting, but is signed by Wynant Van Zandt, jun.

In accordance with this report, the Corporation authorised the use of marble in the "three fronts," and on November 14 concluded a contract for marble from West Stockbridge, Mass. The price was 1 dol. 6 cents per cubic foot, delivered in New York. Under this contract 33,274 feet and 10 inches of marble were delivered. In 1808 the same contractors furnished 2,000 feet more, at 3 dols. a foot. The aggregate of these two bills gives us the

\* From an article by Mr. E. S. Wilde in the *Century*.

amount used in the edifice. Nearly all the building material was furnished by contract. The labour was by day's work. By December 1, 1807, the amount expended had reached 207,000 dols., and the walls were built up to the under side of the second storey window-sills. The expenditures were always in excess of the appropriations, and the slowness with which the work was carried on is attributable probably to the reluctance of the Corporation to increase the burdens of taxation. The stirring political contests of the day induced both parties to act with great caution. At the same time, apart from the question of expediency, the ability of the city to raise money for extraordinary purposes was circumscribed.

In 1808 the wages of the stone-cutters was reduced from 1 dol. 25 cents to 1 dol. a day, and many were given employment who would otherwise have become a charge upon the city. The building was then retarded on account of hard times, for the appropriation was small. In the spring of 1810 it was impossible to obtain workmen enough, and delay was caused by the return of prosperity. In the fall of this year, however, the interior walls had been carried up to their full height, and the interior roof of the wings in part slated. The copper for the upper roof, which was imported at a cost of 2,425*l.* 13*s.* 9*d.* sterling, was daily expected. It did not arrive, however, in time to be used before the following spring. Considerable progress had been made towards finishing rooms for the accommodation of the common council, mayor, clerk, and comptroller; and in 1811 the "city fathers" celebrated the Fourth of July in the new Hall.

It appears that some slight changes were made during construction. In rebuilding the cupola and the dome over the stairs, but little effort was made to restore more than the general appearance of the originals, which accounts for the present deformity of both. Notwithstanding this change, and the damage done less by time than by stupidity, the Hall stands to-day unsurpassed by any structure of the kind in the country. The design is pure. No pains or research was spared. The capitals of the first and second orders are marvels of execution. When some fault seems to have been found during the progress of the work by a competitor of the sculptor, in a communication upon that subject to the Building Committee, Mr. McComb remarked:—"I have visited the carvers' shop almost daily, and have been always pleased with Mr. Lemair's attention, mode of working, and finishing the capitals—work which is not surpassed by any in the United States, and but seldom seen better executed in Europe, and which for proportion and neatness of workmanship will serve as models for carvers in future." The name of Mr. John Lemair, to whom this compliment was so deservedly paid, will be found cut in the top of the blocking course over the front attic storey, together with the names of the Building Committee, architect, and master mechanics. The Ionic columns and pilasters, with their capitals, are remarkably like those in the portico of St. Paul's Church, New York. The latter, however, are fluted and cabled, and in turn resemble those by Ripley in the Admiralty Office, London. The second order is designed after Sir William Chambers, whose work on civil architecture had made its appearance a few years prior to the beginning of the century. The entablature of this order, however, after the Greek, is composed without the dentil, which gives prominence to the modillion and lightens up the cornice, the dentil being introduced in the Ionic order of the first storey, where the soffit of the corona is worked into a plain drip with strong effect. The Classic detail throughout is admirably wrought. There is a touch of the Adam Brothers in the leaves of the capitals to the pilasters of the attic-storey front that is not unpleasing. This part of the building has, in fact, never been finished. The undefined want was supplied in the design by a pedimental foil to the base of the cupola, composed of statuary representing the city arms, which was simply intended to convey the architect's idea. This was to have covered the middle block, while the blocks at either end were to have held respectively the arms of the United States and those of the State of New York. In 1817 Mr. McComb, then Street Commissioner, endeavoured to have this carried out, and stated, in a communication to the Common Council, that it had not been done before for the want of a sufficiently skilled resident artist; that a highly-recommended sculptor having recently settled here, the difficulty no longer existed. He therefore recommended the subject to the consideration of the Board. The Committee on Arts reported adversely, the estimated cost being 8,556 dols. The outlay was considered too great. It was the same committee that in 1830 expended about 6,500 dols. in providing a bell and placing a clock in the cupola. The clock was destroyed in the fire of 1858, and the bell has been removed. In removing the bell the cornice of the rear was damaged, and the decorative parts that were set aside have never been replaced, but still lie upon the roof. The scales have fallen from the hand of the statue of *Justice*, and the birds have built a nest in a break in her side. Heaven benignly wards the lightning from the broken rod on the cupola, but seems powerless to prevent the heavy telegraph cables from tugging at the chimneys. One of these wires stretches, otherwise unsupported, to the roof of the Tract House. Holes for rain-water leaders have been hacked through the cornice, and on the west side the iron rust from a neglected chimney-top has discoloured the marble well down the building.

## ENGLISH FACTORIES.

THE report of Mr. Alexander Redgrave, the Chief Inspector of Factories, for 1883, has appeared, and as half a century has elapsed since the passing of the first effective Factory Act, the year 1883 may be distinguished as the "jubilee" of factory legislation. During the past year there have been 8,996 accidents, of which 401 were fatal. Among the causes of the fatalities, hoists and circular saws are enumerated. As regards hoists, the report says it is hardly necessary to urge the propriety of self-acting doors—*i.e.* of doors which close of themselves and remain closed, unless set open on purpose. There is also another kind of guard of special value, where the space in front of the "well" is confined. This is a contrivance of light iron bars which fold up into the lift-framing when not in use, and expand by means of a pulley into a sufficient gate, somewhat on the principle of a lady's fan. The importance of ascertaining what weight each hoist is built for, what maximum weight is actually taken on, and of testing the friction gear and head gear to see if locking be complete, should be understood. Should even these precautions fail, the use of the self-acting wedge apparatus renders an accident almost impossible. High authorities speak to the truth of the inventor's assertion that if a breakage of the lift-chain occur, the wedges immediately receive the cage, stopping it instantly in a gentle and easy manner, and holding it in perfect safety.

The report says that the barrier or railing which is erected in order to protect people against accidents through coming in contact with gearing is often too low. In other cases the guard is placed too near the wheel. It is suggested that the danger arising from circular saws might be obviated by protecting the workman's hand with a gauntlet. If the use of respirators has to be tolerated in some occupations, why not that of gauntlets? Large circular saws which are placed on the ground-level are generally left without any protection, and in consequence many accidents happen. Whoever, it is said, would invent a really effective protection for circular saws, and could afford to sell it at a price within the means of the smaller firms, would be a benefactor to the working class. In London, the masters generally believe that with care no danger need be apprehended, and therefore they allow workers to take their chance.

According to the report the improvement in the sanitary condition of factories and workshops has required much consideration and discretion. Until the year 1867 the only regulation in force providing in some degree for the maintenance of a healthy condition of factories was that requiring every part of a factory to be limewashed once in every fourteen months. In 1867 a further regulation was made that every factory and workshop should be efficiently ventilated, so as to render harmless, so far as is practicable, any gases, dust, or other impurities generated in the process of manufacture, and should not be overcrowded so as to be prejudicial to the health of the persons employed. The administration of these provisions in respect to large factories presented no difficulties, but it was otherwise in factories where hand labour only was employed, and in workshops in which handicrafts alone are carried on. A representation of the want of ventilation of workrooms has been generally met with the proposition to keep a window or a door open, as if by doing so ventilation was secured. Many London factories were formerly dwelling-houses, and are without any provision for the ventilation that would be adequate for a large number of work-people. The artificial flower trade, tailoring, frilling, umbrellas, ties, fur, ostrich feather, envelope-making and gumming may be said to be carried on in converted dwelling-houses, and in which the atmosphere is tainted for want of change, and from a disinclination of London workers even to allow a ventilator in a pane of glass to admit circulation of air for fear of cold air coming direct upon them. Nor is London alone in the possession of unhealthy workshops. They are found in all manufacturing towns. Mr. Bowling, in his report on Birmingham, says:—"Though great improvements have taken place in the last ten years, there still remain too many places which should be improved off the face of the earth. So much has been done in Birmingham by a combination of philanthropic and commercial enterprise to provide for the working-classes scientific and literary institutes, public libraries, hospitals, provident dispensaries, coffee-palaces, parks, and recreation-grounds, that I sometimes wonder that the idea has not entered the heads of some of the public-minded and large-hearted citizens of this great town to form a company for the erection of model workshops, to be let out to the thousands of small masters who are found now to carry on their handicrafts under very wretched and insanitary conditions. I feel sure that such an enterprise could be made a commercial success, and would result in a vast benefit to the community. Some of the so-called 'mills' in Birmingham, which perhaps hold from twenty to forty tenants, are hopelessly miserable places, and must exercise a very depressing and demoralising influence on the poor people who have to work in them. I think that could such mills be replaced by lofty, well-arranged, cleanly, properly ventilated structures, in which order and decency were enforced, the present tumble-down mills and workshops would soon be emptied, to the great advantage of the town."

## NOTES AND COMMENTS.

WE lately pointed out the omission of an architect's name from the list of the representatives of science and art who were to receive honorary degrees in Edinburgh. We are glad to see that the University has seen the injustice of the omission, and Mr. R. ROWAND ANDERSON is among the artists who have been honoured at the Tercentenary celebration. When it is remembered that the new building for the University has been designed by him, it is only justice that he should obtain all the favour that the authorities can bestow. The original design has not yet been carried out in its entirety, for the campanile, which is one of the essential parts, has not been commenced; but the work which is executed is of such a character as to justify an Edinburgh paper in describing the building as being "the most important edifice erected in this country since public taste, getting wearied of everlasting Gothic, began once more to show a predilection for Classic forms; and whether considered with reference to its style or its adaptation to the purposes of a great medical school, the work reflects the highest credit on its designer."

THE society in Rome which represents the interest taken by Englishmen in classic archaeology has not been fortunate of late years. But we are glad to hear that the last session has been successful, as good papers have been read by Mr. NICHOLS, Mr. PULLAN, and others, while the visits have been carefully organised. France and Germany have Government institutions in Rome, and there are other countries which expend money in promoting research there. All work of that kind must in this country be carried out without aid from the Exchequer; but, considering the number of Englishmen who visit the Eternal City, there ought to be no difficulty in upholding the society. The death of Mr. PARKER is a loss to the cause, for he kept Roman archaeology before the eyes of the public, and the committee have, in consequence, the greater claims upon their countrymen for help at the present time.

IT is proposed to carry out some works at Wells Cathedral as a memorial of Bishop KEN, who was appointed to the see of Bath and Wells in 1684, and was deprived of his office for refusing to take the oaths to WILLIAM and MARY in 1691. The following are considered appropriate works:—First—A memorial window in the north aisle, representing the three following subjects:—(1) *Eli and Samuel*; (2) *St. Paul and Timothy*; (3) *David playing before Saul*. It is believed that these are eminently appropriate to the character of Bishop KEN as a sacred poet, consecrating his gifts as such to the work of Christian education. Second—Fitting up the Lady chapel with stalls and seats for special services and lectures such as have been given during the present year. Third—A new reredos to take the place of the stone screen, somewhat cold and bare in its effect, which at present divides the choir from the Lady chapel.

A PAPER will be read by Mr. J. B. REDMAN on "Thames Communications" at the meeting of the Society of Arts on Wednesday next. In the Applied Chemistry and Physics Section the adjourned discussion on Dr. PERCY FRANKLAND's paper, "The Upper Thames as a Source of Water Supply," will be resumed on Monday. Mr. PURDON CLARKE is to read a paper on "Street Architecture in India" on May 30. It will be illustrated by means of the oxyhydrogen light.

A CURIOUS action has been tried in which the parties are the clergymen who represent what was the old parish of Manchester, and the dean and canons. It was claimed that certain surplus funds should be divided amongst the clergymen instead of among the chapter. One of the questions involved was the conservation of the cathedral. Accounts were submitted showing the following expenditure on the building:—In 1873 the sum of 149*l.* was spent; in 1874, 178*l.*; in 1875, 73*l.*; in 1876, 166*l.*; in 1877, 200*l.*; in 1878, 337*l.*; in 1879, 380*l.*; total, 1,403*l.* The dean and canons admitted that the only parts of the cathedral which they were liable to repair were the chancel, with its side aisles, and the chapter-house. The affidavit made by the gentleman who since 1874 had held the office of bursar, and who now holds the office, stated that the side aisles did not include any of the

chapels. The only repairs for which the assent of the bishop was obtained since 1871 dealt with the eastern walls of the choir where it adjoined the Chetham chapel, and it was alleged that it was only for extraordinary repair that the approbation of the bishop was necessary. In 1873 the Chetham chapel was out of repair, and a considerable sum was raised by public subscription; it had no connection with the choir except that it was entered from it. This expenditure was not within the strict powers of the dean and chapter, because, though authorised by the bishop, it was no part of the cathedral which the dean and canons were bound to repair. But Mr. Justice NORTH, who tried the case, came to the conclusion that, with the exception of damages by wind, storm, or fire, the approval of the bishop was indispensable. The collegiate church, which is now the cathedral, was founded in 1421.

MR. ALFRED MARKS has had some copies printed of his essay on the relation between the *St. Anne* by LEONARDO DA VINCI, which is in the Louvre, and the cartoon belonging to the Royal Academy. It is difficult to trace the history of any work of DA VINCI'S, for the great artist was indifferent to fame, and appears to have given himself no trouble about the perplexities which have arisen from the skill of imitators and copyists. According to Mr. MARKS'S pamphlet, there are about twenty designs and pictures which have a *motif* similar to the work in the Louvre, and it is impossible to say how far they can be identified. The Academy cartoon is a noble example, yet it was neglected by its owners, and appears to have been unknown to SHEE before he was president. The history of the cartoon can no longer be ascertained, but there are grounds for supposing that it is the veritable work which, according to VASARI, astonished all Florence.

AN excellent stained glass window, which has been produced for one of Mr. SEDDON'S churches in Wales, has been on view at Messrs. BALHAM'S. The subject treated is *The Transfiguration*. Much skill has been shown in the arrangement. There are none of the sombre colours employed which are often supposed to confer richness on a window; and the principal figures are marked by the brightness of their garments. Ruby is sparingly used to express the nimbi of the apostles. The figures are vigorously drawn, and without any suggestion of the stiffness that at one time was supposed to be indispensable in stained glass for a Gothic church.

THE Carpenters' and Joiners' Companies have secured for their forthcoming exhibition at Carpenters' Hall the loan from the Royal Architectural Museum of Mr. BURGESS'S well-known drawing of *The Flèche at Amiens*, and also from Mr. A. STREET a drawing of the *flèche* over the Law Courts. The Royal Institute of British Architects have promised to contribute some drawings of carpentry in their library, and drawings of old work have been promised by several architects.

THE following extract, descriptive of the Ambleside of the future, from a letter by Mr. RUSKIN, on the projected railway, will show that he has lost none of his skill in the use of sarcasm:—"It is easy to conceive (I have seen far more wonderful changes) a high street of magnificent establishments in millinery and *nouveautés* running along under the hills from Ambleside to Grasmere, with the railway to Keswick immediately in their rear. I can imagine the sublimity of Wordsworth Crescent and Silverhow Circus commanding the esplanade which will encompass the waters of Rydal and Grasmere, principally, then, of necessity, composed of sewage, while the 'rivulets in May,' which once leaped with LOUISA in the shade, will be usefully disposed in successive tanks of which the scum will be inflammable. A 'lift' to the top of Helvellyn, and a refreshment-room on the summit, will prepare the enthusiastic traveller for a 'drop' to Ulleswater; while beyond the rectilinear shores of Thirlmere Reservoir the Vale of St. John will be laid out in a succession of tennis-grounds, and the billiard-rooms of the Bridal of Triermain Casino be decorated in the ultimate exquisiteness of Parisian taste. Such development of our resources in the Lake District is, I suppose, inevitable. I do not, therefore, question how far desirable. In Derbyshire, on the contrary, there may, perhaps, be yet somewhat alleged in defence of things as they are."

MEMORIAL TOWER TO THE LATE LORD FREDERICK  
CAVENDISH, M.P., &c.

THE constituents of the division of the North-West Riding of Yorkshire, which Lord FREDERICK CAVENDISH represented in Parliament, having determined to erect a monument to his memory, and selected the South Nab, an eminence overlooking Bolton Abbey, as a suitable site, invited designs from three architects—Messrs. CURREY, CARPENTER, and WORTHINGTON.

The design of the last-named gentleman, which we illustrate to-day, was selected, and working drawings have since been prepared for carrying it into execution. It consists of a tower 25 feet square and 80 feet in height, with circular turret stairs, placed upon a platform about 50 feet square, and raised 20 feet from the ground, and it was intended to be built of the stone quarried in the neighbourhood, the Duke of DEVONSHIRE having kindly given every facility for obtaining such materials as the locality afforded.

From a report published in our number of March 8, our readers are aware that in consequence of a memorial to the Duke of DEVONSHIRE from certain artists and others, the question of the site is at present in abeyance, and we understand that the Committee have it now under consideration whether to carry out the memorial in Bradford or the neighbourhood.

WAREHOUSE, PRINCESS STREET, MANCHESTER.  
WAREHOUSE, BYROM STREET, MANCHESTER.

THE buildings shown in the illustrations are among the recent works of Messrs. CLEGG, SON & KNOWLES, King Street, Manchester. An insurance office by the same firm was lately published in *The Architect*.

HOUSES, COLWYN, NORTH WALES.

THE London and North-Western Company having determined upon the erection of a station on their line at Colwyn, North Wales, a few gentlemen recently purchased a small estate immediately adjoining that station, with the intention of forming thereof a seaside resort that would be free from the usual type and workmanship of the speculative builder's lodging-house, and in which the sewerage, drainage, &c., would be carried out with every sanitary precaution. The station was opened about a fortnight since for passenger traffic. The sewerage and road-making are being carried out by Mr. BUGBIRD, contractor, Carnarvon. The block of houses which we this week illustrate was commenced last month, the contractors being Messrs. WILSON, TOFT & HUNTLY, Manchester. The houses are built externally of stone lined with brick, the upper portions being partly in stucco and partly covered with brindled tiles. The estate rises easily from the sea, and commands views of mountain (including the Little Orme's Head) and sea. The rising of the ground is a great aid to picturesque building. A fine background exists in the Llandulas Rock, which also serves the useful purpose of entirely sheltering the estate from the east, and rendering it well calculated for a winter as well as a summer resort. The architect is Mr. CHARLES HEATHCOTE, F.R.I.B.A., 6 Princess Street, Manchester, and at Colwyn Bay.

HOUSE AT MOSCOW.

THE house proposed to be erected at Moscow is from the design of Mr. R. K. FREEMAN, F.R.I.B.A. The plan of this house is arranged on the Russian system, the principal parts being one storey only in height, with kitchen, servants' rooms, &c., in the basement.

CHIMNEYPIECE AT MOSCOW.

THE angles, chimneypiece, grate, and over-mantel are for the dining-room at Speridona, the residence of Mr. R. MCGILL, Moscow. The over-mantel will be of ebonised wood, and the centre panel filled with a painting, other panels having bevelled mirrors. The design is also by Mr. FREEMAN.

HIBERNIAN BANK, DUBLIN.\*

THE Hibernian Bank occupies a striking position in College Green, Dublin, facing the Bank of Ireland, formerly the Parliament House. As a design it may be said to have grown by the exigencies and opportunities afforded by

the disappearance of adjoining buildings rather than by original fixed purpose. It was originally begun in 1863 as the Union Bank of Ireland, Mr. WM. G. MURRAY, R.H.A., since deceased, being the architect, with whose office Mr. T. DREW, R.H.A., who has since completed it, was then connected. It was originally intended to be but three bays in width, and flanked on either side by other buildings. During its erection additional room was acquired on the east side, allowing very nearly, but not quite, frontage for two bays more. The angle treatment and entrance on the splay were devised by Mr. DREW, to fall in with the dimensions of the additional site. Some ten years later additional premises were acquired on the west side of triangular and irregular shape. The building was then extended by some four bays, and finished with a semi-circular end towards the west, adapted to the oblique angle of the boundary. The last extension, inclusive of office fittings, &c., amounted to a cost of 29,000*l.*, and the whole cost about 45,000*l.*

The building is somewhat peculiar in detail, arising out of the striving spirit of some twenty years ago to reconcile Gothic originality and vigour of handling with the general form and composition of Renaissance buildings. There is throughout in this building an avoidance of any cornice, moulding, column, or pilaster which might be identified as drawn from any Classic source. How far a bold essay of this kind may be successful, in spite of its hazardous character, our illustration, from a faithful drawing by Mr. HERBERT A. GRIBBLE, gives an excellent view. Whether the designer, in the maturity of middle age, and further removed from the energetic force of the Gothic revival, would compose in such muscular form or in detail of more time-honoured and accepted character, or whether under the latter conditions he would produce a building as bold in light and shade, and as picturesque, in a street of striking architectural character, are points for debate of posterity. As the building was begun in 1863, it had to be finished in 1874-76. It has not been illustrated until now.

The stone of which it is built is Drogheda limestone, first used on any extensive scale in it, and proved in it to be an excellent and workable building stone, the use of which has now become very widely spread.

The builder of the first portion was Mr. GEORGE MOYERS, and of the latter Messrs. COLLEN BROS., of Portadown and Belfast.

## THE EARLY RENAISSANCE ARCHITECTURE OF ITALY.\*

By R. ROWAND ANDERSON.

WHAT I have to say this evening is in continuation of a paper I had the honour of reading to you last session on the early Italian Renaissance.

In that paper I endeavoured to explain the origin, or rather the development, of Renaissance art, and why that movement took place in Italy rather than in any of the other countries of Europe. I showed you that in Italy the traditions and forms of Roman art had never completely died out, and that the state of architecture in that country readily yielded to, and was influenced by the great intellectual movement which had been at work for a long time previous to its affecting architecture, probably from about the time of Frederick II. in the thirteenth century.

This evening I wish to speak more in detail of the buildings generally of the period, and to show you that wherever this new art was cultivated they did not depart from what I hold to be the true essentials of good old art, and that it was influenced and moulded by and was actually based on the Gothic art, which it was actually displacing; that is to say, that in Tuscany the buildings of early Renaissance are clearly and unmistakably buildings of a Mediæval type clothed with Classic detail. That in Lombardy and Venice the palaces and public buildings are only entitled to be spoken of as Classic by reason of their details and ornamentation; and when you go further south to Rome, you can see that the early buildings of the Renaissance period, of which unfortunately there are not many, are to a greater extent based on Roman, and not Mediæval, buildings; because, as far as we are aware, Mediæval buildings were few in comparison with the number of Roman ones. In other words, the Renaissance of Classic art in its early stage did not mean the reproduction of Roman buildings, and applying them as they best could to their own wants and purposes, as we have done in modern times. As, for example, the High School of this city, the Royal Institution, and National Gallery, where the temple

\* For Illustration see last week's *Architect*.

\* A paper read at a meeting of the Edinburgh Architectural Association.

architecture of Greece is reproduced—in a more able manner than has been done elsewhere, but with the result that you have a bad school building and indifferent picture galleries. Or the elegant and beautifully designed but useless portico of the Surgeons' Hall, and the sumptuous and equally useless and meaningless portico to the Commercial Bank; or say St. George's Hall, at Liverpool, a building much thought of, which, viewed from one side has all the features and dignity of a great temple, and is undoubtedly well designed, but from the other side represents a totally different building, reminding one of the tricks in a pantomime.

These early men continued to plan and construct their buildings as for generations they had been accustomed to; but, under the influence of that ruling passion for the revival of everything Classic that took possession of the Italian people, they gradually introduced the mouldings and decorative features of Classic art. This, which I hold to be the distinguishing characteristic of Early Renaissance architecture, and what justifies us in now making use of it, I will endeavour to illustrate in detail by reference to various buildings in different parts of Italy.

I will first ask your attention to a few buildings of the transition period—buildings where Mediæval and Classic detail are used at one and the same time.

The first is the façade of the oldest part of the great hospital in Milan, founded by Francesco Sforza and Bianca Maria his wife. It was begun in 1437 by the Florentine architect Antonio Filarete. The ground floor has an arcade of semicircular arches, springing from pillars with caps like Corinthian ones, and bases and pedestals of the same type. The arches have a square section, with architraves on the face; they are Classic in everything except their want of refinement and accuracy of detail. These arches are not open ones, but only face ones. Between the pillars are pointed windows of two lights. The pillar, with cap and base, takes the place of the mullion in northern Gothic. The sills of these windows, with corbels under them, have an unmistakable Classic origin. Over these arches and marking off the one floor from the other is a broad band or frieze covered with quasi-Classical ornament; then a row of two-light pointed windows, similar to those below, except that by a prolongation of the outside moulding a square form is given to the window head.

The next building I would call your attention to is the Palazzo Isolani at Bologna, very similar to the last one except that the arcade of the ground floor is an open one. The two-light pointed windows above have fluted pilasters, from which the enclosing pointed arch rises. The two arcades of the courtyard of the Ducal Palace of Venice may also be referred to as an example of the transition.

A very good example, dating from the middle of the fifteenth century, is the façade of the *Fraternità della Misericordia* at Arezzo. The entrance is a deeply-recessed semicircular doorway, flanked by two single-light pointed windows. From the piers of the door and windows rise very flat niches with Classic detail. The stage above this is marked off into similar spaces by fluted pilasters, and in each of the side spaces is an important niche formed by pillars, surmounted by architraves, friezes, cornices, and pediments; then comes a handsome cornice of pure Classic detail, surmounted by a projecting balcony carried on corbels of a quasi-Classical character.

If you refer to ecclesiastical buildings of this early period, you will find the same indications of a transition.

We will now take a survey of the buildings where the transition is complete—and I use this word transition not in the sense it has when you talk of the transition from Norman to Early English, where there was not only a transition in decorative work, but a serious and important one in construction. In Italy the transition is one merely of decoration and the system of construction—that is, a crude and imperfect system of vaulting, and the constant use of the arch, circular and pointed, without the buttress—remains the same. We will commence at Venice, and the first building I would call your attention to is known as the *Fondaco del Turchi*, one of the commercial emporiums, of which there are several in Venice. This is probably one of the oldest buildings there. It is built of brick and is veneered with marble. It apparently consisted in height of three floors, but only two showing to the front. The length of the façade is divided into three, the centre space being much larger than the other two. The floor at the Canal level has an arcade of nine stilted circular arches carried on circular pillars; the arcade of the floor above has sixteen stilted arches, carried on circular columns of the same character as those below. The two end compartments are separated from the centre one by piers, and in each there are three stilted arches on the ground-floor and four on the upper. This facial division into three, if I may so call it, is a distinguishing characteristic of the Venetian palaces and houses, and is also to be found in towns subject to the Venetian dominion down to late times.

The next building I call your attention to is the Palace of Doges. The great external characteristics of this building are the two continuous arcades below and the large amount of wall space above. The arcades are what chiefly concern us: they belong to an early and the best period of fully-developed Italian Gothic, but, like all the Mediæval building in Italy, very defective in construction. It is so here, especially at the angles, and the whole system

of arching and vaulting is tied together with iron rods. The upper arcade has double the number of openings that the lower one has, and the arches of the former are ogee-shaped and surmounted by quatrefoiled circles, while the arches of the latter are plain pointed ones.

I will now ask you to look at a group of Gothic palaces on the Grand Canal. I am sorry I cannot bring before you larger illustrations of these. The *Palazzo Foscari* was built in the fourteenth century, and is one of the finest in Venice. It was purchased by the Republic, and was used for housing foreign potentates when they visited Venice. The other belongs to the fifteenth century, and is known as the *Palazzo Giustiniani*.

Let us now see what influence these buildings, or rather the art of these buildings—for I hold that the constructive traditions embodied in them were never departed from—had on the public buildings and palaces of the *Cinque Cento* period. On each side of the Great Square of St. Mark's are two large buildings known as the *Procuratie Vecchie* and *Procuratie Nuove*. These were built as residences for the procurators or churchwardens of St. Mark's, a large and powerful body in the ancient Venetian Republic. The *Procuratie Vecchie* dates from the year 1500. The ground-floor shows an arcade of semicircular arches, and the two upper floors the same, but each arch only half the width of the basement arches—that is, that the width of the basement arch is equal to two of the upper ones. Each floor is separated from the one below by a broad frieze, and the cornice is crowned by a cresting similar to the one in the Doges' Palace. Unfortunately, I have no illustration of this building that I can show you, but you can readily realise what it is from the Doges' Palace, by substituting round for pointed arches and Classic mouldings and ornamentation for Mediæval detail.

Let us now look at some of the houses, and compare them with the Gothic ones I brought under your notice. Here are some Classic ones—the *Palazzo Dario*, the *Palazzo Manzoni*, two of the best of the *Cinque Cento* palaces; the *Palazzo Corner Spinelli*, early fifteenth century; the *Palazzo Vendramin Calerzi*, late fifteenth century; the *Palazzo Balbi*, sixteenth century. The plans of these houses of the merchant princes of Venice are singularly alike in all periods; they are all rectangles, large or small according to the wealth of the owner. The principal front always and one of the sides frequently abuts on a canal. The block is divided into three divisions. You enter on the principal front into the centre division, which forms a large hall; at the end is the grand stair, and a secondary entrance to the narrow lanes running behind all houses; the divisions on each side of this are divided into the kitchen, stores, porters' rooms, &c. On the first or principal floor the centre space is again occupied as a large saloon, and right and left are the private rooms of the family, and this same division is repeated on the upper floors. This plan is the origin of that system of fenestration so peculiar to all the houses in the cities of the Venetian Republic; it is so frequently seen that it may be called the prevailing one. Compare the façades of these with the group of Gothic palaces I described. You have in each a basement floor, often high for the purpose of getting in a mezzanine or intermediate floor; the principal entrance is in the centre, with smallish windows right and left; and on the principal floor a group of windows lighting the central saloon, flanked by the windows lighting these rooms. The same arrangement is repeated on the upper floors, because the plans are the same. The facial division into three is distinctly seen even in the late *Palazzo Balbi*. Wherein do these Classic palaces differ from the Gothic ones? In nothing but their dress or decoration. The men who built these houses worked in as free a manner as those who built the early Gothic ones, and they did not lay aside the healthy traditions of earlier times till corrupted by the life-destroying power of pedantry and academical rules.

In further illustration of this, let us look at the Gothic *Palazzo Pubblico* of Udine, and compare it with a municipal building in Padua, known as the *Loggia del Consiglio*, a very exquisite specimen of the early Renaissance, as the former is pure Gothic, and was probably built in the early part of the fifteenth century. As it is unnecessary for the purposes of this comparison to describe the whole building, we will confine our remarks to the façade. It consists of two storeys, the lower one being an arcade of pointed arches, carried on circular columns which rise from a good base; a balustrade stretches from pillar to pillar, and you ascend to this loggia by a flight of steps. The floor above displays a large window in the centre, composed of five lights, and two side windows of three lights each. The centre window is provided with a balcony, from which the municipal authorities addressed the people; a small moulded string course divides the two floors, and the wall is finished with a cornice. A few coats-of-arms are stuck about the façade, a custom very common in Italy.

The building from Padua is a particularly fine example of the early *Cinque Cento* architecture of the north of Italy. It consists of two floors in height, the whole raised on a basement. The arches of the ground floor are semicircular, and spring from circular columns. There is a balustrade between each pair of pillars, and you ascend to the loggia by a flight of steps. The upper floor displays three windows, the centre one has three and the side ones two lights, and the wall is crowned by a cornice. I cannot

present to you a more complete parallel. In every essential of construction and arrangement the two buildings are alike, and yet the one is pure Gothic, and the other equally pure Classic work.

Let me direct your attention to an important point of constructive superiority the one has over the other. The building at Padua has a pier at each end of the ground floor arcade. The one at Udine has a pillar the same as the Doges' Palace at Venice. The eye at once recognises the pier as the more stable form of constructing the angle of such a building.

Now let us look a little at ecclesiastical architecture. Previous to the Classic era the prevailing architecture of the churches is what is known as Lombardic. A typical example of this is San Zenone at Verona; it belongs to the twelfth century. Another typical example is the abbey church of Chiaravalli, between Pavia and Milan, also of the twelfth century, remarkable for its central tower, a series of octagons with arches on the faces terminating in a cone, all built of brick.

Now, if we turn to the early Classic churches, we shall see that the traditional method of planning and constructing these remains the same as in Mediæval times. For example, San Pietro, Modena, a type of church façade very common in Italy; and here it is preserved, but the detail is Classic. The façade of the Colleoni Chapel, at Bergamo, erected 1476—circular window, Lombard arches. Dome recalling those of St. Antonio, at Padua. Façade of the Certosa, the work of Ambrogio Borgognone, begun in 1473. Lombard characteristics, circular window and arcades. The octagonal feature at the crossing of nave and transepts, evidently based on the same feature at the neighbouring abbey church, at Chiaravalli. The dome of Sta. Maria della Grazia, in Milan, entirely Lombard in treatment. Doorways of Sta. Maria and the Scuola di San Marco.

We will now travel southwards and examine the buildings of Central Italy. All over Umbria and Tuscany there are numerous cities of the Middle Ages, and in all of them are to be found public buildings and houses, more or less entire, of that period. There is one type from which all succeeding varieties spring.

The next stage in development is the introduction of tracery. The lecturer here showed some windows from Florence in a book, and explained the cortile of the Palazzo del Podestà, about 1332, and also compared these with some of the great Florentine and Bolognese palaces.

#### *The Early Renaissance as Worked out in other Countries.*

The aspect of the Early Renaissance can be followed up beyond the limits of Italy. If you go to France, where the change set in later than in Italy, you find the very same steps being taken. There is no sudden adoption of Italian Classic art. The mouldings and decorative detail are gradually engrafted on buildings still eminently Mediæval. Take the Town Hall of Orleans as an example. It consists of three floors, and the façade is divided vertically with pilasters into wide and narrow spaces—the former for the windows, the latter for niches. The ground floor has plenty of wall space, and small square-headed windows, with moulded jambs, and the label mould peculiar to late Gothic. The windows of the principal floor are tall and of two lights, and divided into three in the height by two transoms. Then come a rich cornice and pierced parapet; then a row of two-light windows with transoms, half of their height in the roof, Classic pilasters at their sides, triangular pediments, surmounted by a Gothic finial. The roof is very steep, and is surmounted by a rich Gothic cresting. The details of the niches and figures between the windows are late Gothic, and much of the ornamental detail and the pilasters are Classic.

The house of Agnes Sorel in the same town has a front to the street, with bits of Classic detail introduced here and there, a steep roof with dormer windows, and arches on the street floor. In the court the treatment is still Mediæval, but the entire detail is Classic. If you will refer to vol. vi. of V. le Duc's Dictionary, under the word "Maison," you will see some charming woodcuts illustrating how the change gradually came about in town houses. Down to the end of the sixteenth century, in many places, the houses are distinctly Mediæval in treatment. The house in the Rue St.-Rome, Toulouse, is a good example of this. The ground storey is arched. The door of the stair to the floors above has a constructive fanlight. The windows have mullions and transoms, and, although the roof is flat like an Italian one, you must remember that the roofs of the early Mediæval buildings in this part of France are all low-pitched.

Compare this with the two examples of late Gothic houses from St.-Antoine, and you cannot say that there is any difference in principle, only in decorative detail or dress.

The large châteaux of the noblesse were still planned as Mediæval castles, with such modifications as were gradually transforming them from places of defence and refuge into country mansions, and, although the decorative details are all Classic, the buildings themselves have nothing recalling the temples, basilicas, or other buildings of ancient Rome. The same modification was taking place in ecclesiastical architecture. A notable example of this is the church of St.-Eustache, in Paris. Here the plan is a five-arched church of considerable dimensions; the construction

throughout, including the vaulting and buttresses, is Gothic, and the entire detail is Classic.

The church of St.-Etienne du Mont, the cathedral at Dijon, and some of the churches at Caen, in Normandy, may also be referred to. The church of Tiloloy, in the Department of Somme, is an excellent illustration of this. The whole structure is one of those wide-spanned late Gothic churches not uncommon in France. The west end is flanked by large circular staircases. The roof is very steep and the gable is crocketed; the principal windows are circular and filled with tracery, the niches have the usual canopies and corbels, but nearly all the detail is Italian Renaissance.

Travelling further north, let us see what we find in Belgium. This country, renowned in the Middle Ages for its great manufacturing and commercial enterprise, is covered with towns which were then great and prosperous, and in which you can still see buildings, civil and ecclesiastical, of all periods. The series of photos and lithographs I have here illustrate houses of the fifteenth, sixteenth, and seventeenth centuries, all of which will bear out the proposition I started with—that the Renaissance of Italian Classic art did not in the earlier and healthier stages mean the abandonment of the good old methods of planning and constructing.

We might now cross the Channel and follow up this investigation, but from the comparative poverty of this country in the Middle Ages and the early Renaissance period, compared with the cities and countries of the west of Europe, we are not so well furnished with examples illustrating this; but both in England and in Scotland such buildings as we have of the sixteenth and seventeenth centuries bear out what I say.

I think I have now demonstrated the proposition I started with, viz., that the revival of Classic art did not mean, in the earlier and healthier stages, the reproduction of the buildings of Rome, and that it contained the germs and potentiality of a consistent style of architecture, till all that was good in it was crushed out by the pedantry and dry academical rules of the later Renaissance. At the present moment the tendency is decidedly to revive this early Italian art; and, if a right use is to be made of it, it is important to have a clear conception of its former rise and fall, and the causes that brought these about. It is also important to remember that what is going on to-day is really the third revival of Classic art. The first began in the thirteenth century and continued till the beginning of the present one. The second chiefly belongs to this century, and the third is now in progress, and is better known in the south by the name of Queen Anne. Will this movement we are now engaged in be more permanent than the previous ones? To answer this question it will be worth while to glance briefly at the second revival of architecture. The seeds were sown far back in the last century, and it was a revival of a much more comprehensive nature than the Renaissance of the fifteenth century, because it embraced Greek and Mediæval art as well as Roman. About 1742, the Brothers Langley published a volume on "Gothic Architecture improved by Rules and Proportions, and Geometrically Explained;" and shortly after Walpole erected his historic villa at Strawberry Hill. Inverary Castle in 1745, is what was supposed to be both Gothic and castellated. Fonthill Abbey in 1796; Eaton Hall, Cheshire, 1803—these two latter being ecclesiastic and not domestic in character. In 1750 the ruins of Palmyra and Baalbec attracted attention, and ten years after this Adam published his work illustrating Diocletian's palace at Spalatro. In 1762 the Dilettanti Society began the publication of a series of illustrations of Greek art, commencing with Stuart and Revett's delineations of the remains at Athens. Up to the beginning of the present century the style of the Brothers Adam, which was largely inspired by the effete Roman art of the era of Diocletian, reigned supreme, and that may fairly be called the end of the first Renaissance. Then followed a period of utter darkness, and it is generally admitted that in the early part of this century architecture was at its lowest ebb. The struggle with Napoleon absorbed all the means and energy of the Empire, but at the close of the French war, when the country had time to cultivate the arts of peace, there began in earnest the battle of the styles which has waged with varying fortunes till now. Concurrent with this revival of architecture was the rise of archæology into an exact science, followed by the great Church movement in England; and these no doubt stimulated that passion for correctness, or, if you like to put it, mere copying, which characterises the best work of the present century. Greek and Roman temples, Gothic abbeys and churches and Scotch castles sprung up everywhere, adapted to all purposes indiscriminately, and at any price, and all were tested by their correctness, and pronounced good or bad accordingly, irrespective of the higher aims and objects of architecture. Bad as were the later stages of the Italian Renaissance, there is this to be said in their favour, that their houses and public buildings were, with all their defects, modern ones.

The revival of this century differs in this respect, that it has been pre-eminently an era of reproduction and not adaptation, and it is doubtful if we have come to the end of it. Gothic has for the present, at least, practically been discarded; but is this revival of early Italian art to be more permanent? or are we merely to cull all its beauties and its blemishes, reproduce them, and apply them as indiscriminately as we have done with Greek and Mediæval

art, and, after being satiated, fly off to—well—it will be very hard to tell what? Or, are we to hold fast by those sound traditions of construction and adaptation of means to an end that are to be found by all who carefully study the great works of old? If we do not, then the present fashion will pass away in favour of something else, because early Italian architecture, however well it can be adapted to the various wants of the present day—and there is no doubt that it can be, but not to any greater extent than Mediæval art—is so vitiated by its structural insincerity, derived from the Mediæval art that preceded it, that it contains the certain seeds and signs of decay; and in these days of over-production it will be a rapid one.

If our art is to become a real one, and not, as is too often the case, one very little above the level of that of the scene-painter, we must strive to give it that structural sincerity and—so long as we build in stone and brick—those sound principles of construction which are only to be found by all who search in the Mediæval architecture of our own country, and the solution of this is sufficient to engage the attention of all who desire to see our art, the queen of arts, established on a sound basis.

### THE FORESTRY EXHIBITION, EDINBURGH.

THE foreign exhibitors have already applied for some 4,000 feet of space in the forthcoming Edinburgh exhibition. Sweden and Norway will only be officially represented by collections of forest seeds and contributions of maps and charts, but the timber and pulp and paper industries of these important countries will occupy a space of from 1,500 to 2,000 square feet. From Italy, France, Russia, and Germany many applications are being daily received. Further telegrams from the Viceroy of India have increased the space already applied for, so that the court will include 6,500 square feet. The preparation of the timber trophy from the Andaman Islands, which embraces some grand specimens of the native woods, has been entrusted to Mr. Shillinglaw, Edinburgh. Messrs. Beattie are making rapid progress with the exhibition building, and the directors of the Tramway Company are providing for the largely increased traffic which is to be expected from the influx of visitors, by placing new rails on the Haymarket section of their line. The date of receiving exhibits has been fixed between June 10 and 18, but already the secretary's office is beginning to wear a foreign aspect from the contributions sent from Canada and India, and a large store-room at the Great Northern Depository is getting gradually filled with exhibits from foreign residents who have been unaware of the date of the opening.

### BANKRUPT BUILDERS.

A BANKRUPTCY case, which involves several points of law, and has been before the courts on several occasions, was again heard on the 10th inst., at Truro, before Mr. Montague Bere, Q.C., County Court Judge. The bankrupt, Mr. Alfred Jenkin, carried on trade as builder at Hayle, Cornwall, and from evidence given it appears that when in March, 1883, bankrupt filed his petition, he had two contracts in hand, viz., offices at Tucking Mill, amounting to 1,301*l.*, and Wesleyan Chapel at Porthleven, amounting to 2,465*l.* In consequence of the bankrupt being unable to proceed with the work, the contract for building the chapel was rescinded, and Messrs. Winn & Son, of Helston, finished it in bankrupt's stead. The contract with Jenkin stated that in case he became bankrupt, or failed to carry on the work, he should not be entitled to any further payment.

The Judge, however, ruled that such a clause was not right in equity; and that, after all payments had been made, the balance, if any, between actual cost and contract amount should be paid to trustees in bankruptcy for the benefit of Jenkin's creditors.

The Chapel Trustees now contend that they are entitled to deduct not only all money actually paid on the building, but also the further sum of 40*l.* loss of pew rents, arising in consequence of the work having been delayed for twelve months, and in addition the fees, amounting to 22*l.*, paid to the architect, Mr. James Hicks, of Redruth, for extra services and expenses, and 27*l.* for solicitor's costs. On these points the Judge has reserved his decision. During the hearing the rules of the Royal Institute of British Architects were presented to the Court, to prove that the architect, although paid 5 per cent., was entitled to the further fee of 22*l.* for extra services and costs, but the Judge declined to accept that document as evidence.

In the case of the offices at Tucking Mill, for Messrs. Bickford, Smith & Co., safety fuse manufacturers, the Gweek Company of timber merchants stepped in and guaranteed the completion of the works on condition of the balance of contract amount being paid to them. This guarantee was made in January, about ten weeks before bankrupt filed petition. The Judge, however, decided that as these timber merchants were large creditors they had no right to any profit on the transaction, that they should be allowed out of pocket payments only, and that whatever profit accrued should be paid to trustees in bankruptcy for the benefit of bankrupt's estate.

In the examination of the accounts of the Gweek Company, it was found they paid the architect 21*l.* 15*s.* 6*d.* for quantities which were prepared in the usual way for builders to submit tenders for the work, and which formed a portion of the building contract. The architect was called to give evidence, and stated that when the Gweek Company entered into their guarantee they examined the bills of quantities, together with his estimate of cost for completion of works, and that the sum of 21*l.* 15*s.* 6*d.* was pointed out, and that the first instalment paid to the Gweek Company contained this amount, and he then asked for it to be refunded to him in the usual way. This demand was made in writing on February 14, and the amount was paid in due course. The trustees in bankruptcy contend that this amount should not have been paid to Mr. Hicks, and that it should be refunded by him for the benefit of bankrupt's estate. On the other hand, it was contended that Mr. Hicks was employed by Messrs. Bickford, Smith & Co. to prepare the quantities before bankrupt was known, and that his employers were liable to him for the amount, and that, if the amount had not been paid, it should be deducted out of balance of contract; and, further, that Mr. Hicks could not now be made a creditor to the estate, as he was never employed by bankrupt. The Judge said he would take time to consider his decision.

Another curious point raised was as to the validity of a guarantee made both by Jenkin and the Gweek Company, that the sum of 45*l.* due to certain other merchants should be paid out of balance of contract amount. It appears that Messrs. Rabling & Co. supplied goods to Jenkin, that a guarantee was given by him for payment out of the contract amount, and that it was afterwards confirmed by agreement between all the parties. The question is how far that guarantee is now valid, or whether the amount shall go to bankrupt's estate. Decision was reserved.

Five solicitors, besides trustees in bankruptcy and numerous witnesses, have been engaged from time to time on these various points of law. The bankrupt failed in 1,500*l.*, the assets being 16*l.* and the final balance out of the two contracts, if any.

### EDINBURGH UNIVERSITY BUILDINGS.

THE Tercentenary Festival of the Edinburgh University has given rise to a series of articles in the *Scotsman* on the rise and progress of the University. In recording the history of the buildings the writer says:—"The construction of a southern road into the city must have brought out most forcibly what Principal Robertson had been insisting on for many years—that the College buildings were in a very dilapidated condition, unworthy of the fame of the school, and quite inadequate for the crowd of students taught within its walls. In fact, professors and students had been forced to leave its bounds, and we read of at least one class which met in the High School; the number attending in 1788-89 was 1,090. As far back as 1768 a "Memorial relating to the University of Edinburgh" was drawn up, probably by Robertson, and an attempt made to raise a sum by subscription sufficient to rebuild the College; but the subscription was not successful, and the idea was given up in the meantime. But, when the South Bridge had been agreed on, there appeared "A Letter to the Right Honourable Henry Dundas, &c., &c., on the Proposed Improvements in the City of Edinburgh, and on the means of accomplishing them, 1785," in which the needs of the University for proper buildings and its wants are plainly and fully set forth. The subscription which followed this second appeal was fairly generous, considering the state of the country at the time, 18,009*l.* being collected, "besides 322*l.* 10*s.*, Jamaica money," and very considerable sums came in afterwards from abroad. So encouraged, the Town Council obtained plans for a new college from "Robert Adam, Esq., London, architect to King George III. and to Queen Charlotte," &c., &c.; and a grand ceremonial took place on November 16, 1789, when the foundation-stone was laid with full Masonic honours by Lord Napier, Master Mason of Scotland, "in the presence of provost and magistrates, principal and professors, and many of the nobility and gentry from all parts of the country," who had marched in procession through streets lined "by a detachment of the 35th Regiment," and by that warlike band "the City Guard," and in presence of a crowd of onlookers "which could not be less than thirty thousand." We need not describe the procession—for is it not written in the chronicles of the *Scots Magazine* for November 1789?—nor picture the ceremonial of laying the foundation-stone, for our readers may see that with their own eyes, as the old print of the scene has been republished.

We should like to picture to Edinburgh men, if we could but picture to ourselves, those struggling old college buildings which were doomed to demolition in the year 1789. We have failed to realise them fully, however, for it is strange that we believe there is no sketch of the whole extant, and "pictures in words" are hard to understand. We will tell what we know. The site was essentially the same as that occupied by Robert Adam's classical pile. On the south and west sides, the buildings must have touched, or nearly touched, the lines of Lothian Street and the Horse Wynd. On the east they must have been very much within the line of the present buildings; for the old Library, as shown in Lizar's

sketches, is several feet within the buildings forming the present gateway. South-east, and attached to the old Library, however, was Monro's Theatre, erected some time about 1760; but this must have been already swept away by the South Bridge Street. On the north, the College buildings probably bounded as they do now, for Bower relates that in 1698 a fire broke out in the College Wynd, "and from the narrowness of the lane between those buildings and the college, the Library in particular was exposed to danger;" while Chambers's "Reekiana" informs us that the author was told by Sir Walter Scott that the house in which he was born, at the head of the College Wynd, was cleared away "to afford room for the street"—North College Street, and we remember that this roadway was not very wide. East from the College buildings to the walls of the Infirmary stretched the "College Gardens," and on the south, as shown by Edgar's and Kincaid's maps, the strip between the College houses and the city wall had been planted with a row of trees. Within these bounds the buildings were arranged irregularly in three courts. The one to the south occupied a larger area than the two to the north, and steps led down from the higher level of the southern to the westmost of the two smaller; the latter was the only one in which the buildings formed a complete square—two sides of the eastmost of the smaller squares being formed, so far as we can make out, by a mere boundary wall. We have several general descriptions by strangers of the College buildings—the latest, that in "Topham's Letters from Edinburgh" (Letters 25 and 26), is perhaps the fullest—and these contain much plain speaking about professors and students. All accounts, including that given in the amusing notes of "Theophrastus" on Edinburgh, brought down to 1788 in the appendix of Arnot's History, tell of these buildings being in a "ruinous condition"; and we can fully imagine that they were so, if we consider their age, and take into account that, from the sketches we have of some of them, they look as if they were cheaply built at first. The three quadrangles were approached by two entrances—one on the north, opposite the head of the College Wynd, surmounted by a steeple; the other at the "Potterrow Port," a simple gateway. Some of the houses which were first demolished for the new College buildings are described in the *Scots Magazine* for April 1790, and as the article is fuller than that quoted in Sir Alexander Grant's "Story," we suspect it is the original, and that in the *Caledonian Mercury* only an extract. We need not copy here the Latin inscription on the house of the Professor of Divinity relating the liberality of "Bartholomew Sommervell;" nor that on "the painted board preserved within the Divinity Hall," which, in gilt letters, told of gifts to the Library; nor redescribe the tower above the northern gateway, "12 feet square and six storeys high, or about 80 feet from the ground," upon which "was a pavilion roof terminating with a vane." We only wish we could but see in one of Lizars' engravings the old steeple and the yet older "Duke's lugeing." It is pleasant to know that, although we cannot make out the appearance of the northern face, we can almost trace the whole of the buildings of the southern court. If any one will take Lizars' engravings, executed for Playfair, and compare them with the exceedingly interesting views in Mr. Stephenson's recently published book, he will find that these sketches contain the greater number of the detached houses which formed the southern quadrangle. He will see that, with the exception of the Library, they are all two-storey houses, and that the upper storey of some of them, having "storm windows," must have had low ceilings; he will notice the variety of architecture and the tablets above the doors, on which would be inscribed the name and titles of each several donor; he will, in fine, have fully confirmed Professor Craufurd's account of how the buildings were erected, one by one, as generous citizens came forward with money. The more he looks at these buildings the more he will wonder how the 1,100 students were accommodated, and where the Principal and Professor of Divinity found house-room.

It is not within the purport of this article to relate the "long drawn out tale" of the erection of the new buildings. It is an interesting story, which we do not mean to tell. Suffice it to say, that the first class-room opened was by the Professor of Anatomy, in October 1792—Monro's Theatre having been swept away by the South Bridge Street; that other two classes were provided for, and that building then came to a stop, the subscriptions being all spent; that, in 1801, a grant from Government of 5,000*l.* finished the portion which had stood for some time without roofs; and that at last, a few days after Waterloo was fought, a vote of 10,000*l.* was obtained from Parliament, and repeated year by year until, in 1825, the College was completed. We do not need to describe buildings which every Edinburgh man knows so well, and which each of our guests can see for himself.

**Butchers' Company New Hall.**—The Court of this company have selected the design of Mr. Alexander Peebles, F.R.I.B.A., from amongst those which were submitted to them by invitation for their new hall, about to be erected in Bartholomew's Close, in the City, and have instructed Mr. Peebles to proceed with the necessary works. The design is in the Classic style, freely treated, and the building will contain the hall, court and committee rooms, offices for the officers of the company, a ladies' drawing-room, and all other necessary and suitable domestic and other apartments.

#### Carved Brickwork.

SIR,—In the criticism of the exhibits at the late Building Exhibition by one of your contributors there are one or two remarks with regard to carved brickwork so very erroneous, that, in justice to ourselves, we cannot allow them to pass unchallenged.

He asks, "What is the substantial value of a brick after its surface has been chiselled and carved away, and even undercut?" We answer—the clay used in the manufacture of these bricks for carving is specially manipulated, and the bricks are so burnt as to have the same weather-resisting qualities all through, and are equally well able to stand the severest weather, either built into the building as taken from the kiln, or simply rubbed to a smooth face for plain gauged work, or afterwards carved into the most delicate mouldings. We can give substantial proof of this in some carving executed before the severe weather of a few seasons back; and it may not be generally known that when these bricks have been rubbed to a perfectly smooth, level face, and built in as gauged work, they are a much brighter colour than facing bricks made in the usual way from the same clay, and apparently the same shade of colour when first taken from the kiln; were they *not* well burnt all through, the colour of the rubbed bricks would be duller than those used as taken from the kiln. Again, it is now a well-known fact these bricks are so quickly hardened by wet that many mechanics, if working by task-work, will not use them unless delivered on to the job perfectly dry, and after being put into the building they harden very quickly by the action of the wet and sun.

Again, your contributor says "the carving is done on a material not meant for any carving." With all deference to him, we most positively contradict this statement; for when first taken from the clay bed every particle is most thoroughly washed and passed through *very fine* screens; then, after settling again into a solid substance, and before being moulded into a brick, it is all worked into a homogeneous mass, thereby uniting every particle together in the most solid manner, making the bricks fit to be used for the highest class of ornamental drawing.

We will not trespass further on your valuable space, but enclose a copy of testimonials we have received, and of which we beg your perusal, wherein you will see the good opinion many of the leading architects of the day have of these bricks.

Apologising for troubling you, we beg to remain your most obedient and obliged servants,

April 9, 1884.

THOMAS LAWRENCE & SON.

#### NEW BUILDINGS.

**The Empire Theatre.**—This building, which was partly constructed according to plans by Mr. T. Verity, has been completed, owing to a change in proprietorship, by Messrs. Bywater, under the direction of Messrs. J. A. & E. Bull. One of the principal features in the arrangements is the large space allotted to promenades, foyer, &c. In this respect the theatre is almost unique. In the entrance hall and vestibule are some splendid specimens of scagliola columns and pilasters with gilt capitals, which have been produced by Messrs. Bellmann & Ivey. The grand tier or dress-circle is on a level with the vestibule. Behind its four rows of seats is a range of comfortable private boxes, corresponding in width of area with a space on the floor above, which contributes to the formation of a broad promenade, communicating with a capacious foyer, whence an open view of the stage may be gained. The boxes are carried by wrought-iron cantilevers, which, with the fireproof floors, have been constructed by Messrs. Dennett & Ingle. Large as it is, the foyer is, in its effect to the eye, indefinitely extended by vast panels of looking-glass, reaching from floor to ceiling. The scheme of colour throughout is crimson and gold, and additional richness is given by pictorial designs in various parts. Facilities of exit, in case of need, are favoured by the unusual allowance of unoccupied space over and above the seated accommodation of the theatre. The orchestra stalls number 180; there are 106 reserved pit-stalls behind; and in the rear of these, again, is a capacious pit, with a promenade 12 feet wide, room for 550 persons being here afforded. On each level the supply of lavatories and retiring-rooms is ample. Massive and elegant decorations surround the proscenium arch, 32 feet in width and 35 feet high. The ceiling of the auditorium is circular, and bordered by an elaborate cornice and arcade, the supports being columns and caryatides of colossal dimensions. The length from the proscenium to the back of the pit is 83 feet, the width from wall to wall is 88 feet, and the height from the stalls to the ceiling is 51 feet. All the tiers and corridors are of fireproof construction, and the wood-framing is coated with cyanite.

**London.**—The Criterion Theatre, which has been closed since March last, was reopened on Wednesday evening. Since the theatre was closed important alterations have been effected in its

structural arrangements, under the direction of Mr. T. Verity, the architect, and special attention paid to the means of exit in case of emergency. The result is now an abundance of corridor space. To each floor on the theatre are four exits—two on each side—leading to Piccadilly or to Jermyn Street, and there are stage doors likewise giving exit on both sides of the building. An area open from the basement to the sky has been provided on one side of the theatre by the sacrifice of a portion of the space hitherto allotted to the restaurant. Thus fresh air and light are admitted to the building. The auditorium has been greatly improved and brightened. The number of private boxes has been reduced. The electric light has been provided in every part.

### NOTES ON NOVELTIES.

Our illustration shows a form of water-closet which is recommended by the makers (Hayward Tyler & Co., Whitecross Street, London) as being the least expensive closet that can be adopted for houses of the best class, hotels, &c. The arrangement is a combination of their well-known "full-flush" basin, with "Howard's patent" syphon cistern. The full-flush closet has been specially commended by the best judges, having, as far as we are aware, carried off the first awards for water-closets at every exhibition of the Sanitary Institute, the National Health Society, &c., in which it has competed, being in some instances subjected to very severe tests by blacking the inside of the pan to see whether all parts were perfectly scoured at each flush, as well as trying by other means whether the whole solid contents were carried past the trap even

under unfavourable conditions. The appearance of this closet, when fixed, is certainly suitable for the best class of houses, the large pan (very similar to that of the best valve-closets), being handsomely decorated in excellent taste. There is a good depth of water at the bottom of the closet, and it is found in use to be a complete preventive of bad smells or sewer-gas discomforts. There is one subsidiary advantage in closets of this class, that in case of any failure in the regular water-supply from frost, &c., they can always be perfectly flushed by pouring water down, which cannot be so conveniently done in closets of the side-outlet class, these latter requiring the flush to come in a certain direction to carry away the contents of the pan. Hayward's patent cistern has been lately noticed in our columns. It is an excellent cistern, combining the advantages of the single and double-box systems, and is being largely adopted in the New River Company's district and elsewhere. The closet shown in the engraving has the bell-pull arrangement, which is now frequently used, being simpler and cheaper than a handle and cranks, but at a small additional expense the sunk dish and handle on a suitable bracket can be added. When this closet becomes known, it will be likely to prove of great value to architects and builders, especially for villa residences, seaside houses, &c., where it is needful to supply a closet of handsome appearance at small cost, and one not liable to get out of order or cause trouble. It also forms an excellent closet for railway stations and hotels, when the cistern is worked by the opening of the door.

### ART WORKMANSHIP.

**Mosaic Pavements.**—Messrs. Burke & Co. have just carried out two important works in a remarkably short space of time. The first is a mosaic pavement at the head office of the National Provincial Bank of England. Worn-down Portland stone landings had to be worked off, and a mosaic pavement, covering an area of nearly seventy yards, laid between Thursday night and Wednesday morning, no work being allowed between the hours of 9 A.M. and 4 P.M. on the Saturday between midnight of the same day, and 6 A.M. Monday morning, nor between 9 A.M. and 5 P.M. on Tuesday. The time occupied, therefore, on the work *in situ*, allowing for meal-times, was sixty hours, equal to six working days, and one-half the time was taken up in working down the stone. The architect, Mr. Charles R. Gribble, has expressed himself well pleased with the rapidity of the work. The second pavement, which is at the Turkish Baths, Jermyn Street, had to be carried on in a temperature of 135 degrees. The old marble pavement was removed, concrete put in, and a mosaic pavement laid between Thursday evening and Tuesday morning. Messrs. Burke & Co. are carrying out a large order for mosaic paving at the Technical Institute, South Kensington, under Mr. Waterhouse, A.R.A. We may also mention that they a short time ago laid a mosaic pavement at Marlborough House for H.R.H. the Prince of Wales, under Mr. John Taylor, architect. Messrs. Burke & Co. are enabled to lay floors thus rapidly in consequence of having the cubes or tesserae faced by machinery before being gummed on to the brown paper in the usual way, thereby saving the time previously required to sand down the irregular and rough surfaces.

### GENERAL.

**Mr. Whistler** has been engaged in painting views of Cornish scenery, which will shortly appear on exhibition in London.

**The "Hanging Committee"** of the London Society of Artists' exhibition will be constituted as follows:—Messrs. Phil. Morris, A.R.A.; C. B. Birch, A.R.A.; Hamo Thornycroft, A.R.A.; Thos. Brock, A.R.A.; Bernard Evans, J. A. Fitzgerald, S. F. Hodson, W. Hughes, and W. Christian Symons.

**An Exhibition of Portraits** of eminent Scotsmen and women is to be held in Edinburgh during July, August, and September, under the auspices of the Board of Manufactures.

**The London Museums and Galleries** attracted fewer visitors on Monday last than on similar occasions. There were 8,500 visitors to the British Museum, against 16,500 in 1883 and 15,685 in 1882. Last year the number of visitors to the South Kensington Museum was 34,603, while this year the number fell to 22,971.

**Mr. Hodder M. Westropp** will deliver three lectures at the Royal Institution, on "Recent Discoveries in Roman Archæology," on April 26, May 3, and May 10.

**Messrs. Rottman, Strome & Co.** have supplied the Japanese embossed papers which have been used in the decoration of Almond's Hotel, Clifford Street.

**Mr. T. W. Camm** read a paper at the last meeting of the Birmingham Archæological Association upon "Art Aims in Architecture."

**The Death** is announced of Mr. George Milner, who was the contractor for the railway between Manchester and Retford; for the East Lancashire line from Preston through Ormskirk; and for some heavy works in connection with the docks at Liverpool. He was born in 1802.

**A Fund** is proposed to be raised for restoring the roof of what is known as Alderley Old Church, the venerable structure so intimately associated with the memories of Bishop Stanley; his son, Dean Stanley; and other members of the Stanley family. The new chancel screen, which has been in preparation some time, will be opened in the course of a few weeks.

**A Roman Well**, the sides of which are of Sarsen stone, has been discovered in a field opposite the Savernake Hospital, Marlborough.

**South Darley Church** is proposed to be enlarged and improved. It was built in 1840, and designed by the late Mr. Mitchell, of Sheffield, as an exact copy of Noyles church, Normandy. The proposed improvements have been entrusted to Mr. Mitchell Withers, architect, Sheffield.

**A Cottage Hospital** is to be erected at Newbury, at a cost of 3,950*l*.

**Northern Architectural Association.**—A quarterly meeting of this society was held at Newcastle-on-Tyne on the 8th inst., Mr. H. W. Rich, president, in the chair. Mr. Joseph Oswald read a paper, in which he threw out several valuable suggestions, by the adoption of which the association might be made more popular with the profession and more influential with the public at large. A vote of thanks was accorded to Mr. Oswald for his excellent paper, and Mr. Newcombe moved that the question of the best means for giving effect to the suggestions contained therein should be referred to the committee. Mr. Reay seconded the motion, which was agreed to. Messrs. Rich and Newcombe were appointed delegates to represent the association at the conference to be held at the Royal Institute of British Architects in May next.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, APRIL 19, 1884.

### CONTRACTS OPEN.

**ABERGAVENNY.**—April 23.—For Re-seating Holy Trinity Church. Mr. T. Nicholson, Diocesan Architect, Hereford.

**BELFAST.**—For Building Nine Houses. Mr. Gibson, 2 Atlantic Avenue, Belfast.

**BELTHORN.**—April 30.—For Rebuilding Chapel. Mr. J. Yates, Architect, 3 Tackett's Street, Blackburn.

# The Architect.

## PROPOSED CHANGES IN THE CONSTITUTION OF THE INSTITUTE OF ARCHITECTS.

MEETING of the Institute of Architects was held on Monday evening, which may turn out to be an incident of great importance to the profession at large. It was one of the periodical meetings for the private business of the Society, and the agenda contained three proposals; the first in order being that the voting papers for the election of the Council should no longer show a distinction between the old members of the Council and the new nominees, practically perverting of the freedom of election; the second, that

the foreign secretaryship should be restored; and the third, that the admission of Fellows should be made subject to an examination test. But the outcome of the business as a whole was that the Council have undertaken to promote a consideration of the question of revising the constitution, so as to satisfy generally the demands for reform which have recently become overwhelming.

The first of the three motions is one to which we do not attach much importance, except that there is no doubt a growing desire for freedom of election in all English affairs whatever; the second is a matter affecting materially the dignity of the Institute as the professional guild of a great cosmopolitan and historical art; the third is perhaps a still more important question as regards the status of the profession. The first was put to the vote and rejected, chiefly, we are sorry to say, through the questionable loyalty of the members of the Council, who seem to think it right, in a thin meeting, to vote as one man in favour of their own prerogative. The second was met by an amendment which was at once accepted by the mover as equivalent to his own proposal, but after discussion it was thought expedient to drop the matter for a time, on account of its importance, we may say. The third—that affecting the examination—was allowed to stand over pending an inquiry into certain points of law. But, as we have said, the meeting accepted as an equivalent for action on all such questions for the present an intimation that the Council might be trusted to institute a preliminary investigation of the charter of the Society as regards its efficiency, now that the profession has been gradually changing for nearly fifty years since it was granted.

The remarks made by the mover of the resolution for re-establishing specially the office of Secretary for foreign business, were to the following effect. In former times there were two honorary secretaries appointed in express terms of the charter, one of whom took the home business and the other the foreign. Professor DONALDSON was foreign secretary for many years, and no doubt in that capacity did more than any one else to establish the Institute on the highest artistic and literary ground—now, alas! wholly abandoned. Upon his retirement, Mr. EASTLAKE being the stipendiary secretary, and in rank a Fellow, it was thought to be due to his personal eminence that he should be regarded as one of the charter secretaries, and Mr. COCKERELL was appointed as his colleague to take foreign affairs. This answered very well until Mr. EASTLAKE retired, and Mr. COCKERELL retained office with Mr. WHITE, his successor. But when Mr. COCKERELL died, the foreign business was virtually dropped, and there were several speakers who joined in the opinion that the formal correspondence of a salaried secretary—whose proceedings, we have reason to know, are more than even formal—could not be a proper substitute for such work as used to be done by Professor DONALDSON. It was also remarked that others of the greater objects of the Institute seem to have been dropped of late, and especially that the ordinary meetings are now so conducted that the business is confined to the reading of a paper (the speaker might have said a paper sometimes of very questionable relevancy) and a debate, not by members of the Society, but by invited visitors—a state of things characterised as a most

feeble attitude. We can scarcely doubt that a return to the dignified old custom of the meetings, as well as that of the conduct of foreign business, cannot be long deferred.

The proposal to revise the charter, and of course the principles of government—although adopted by a member of the Council, who considered he could speak for his colleagues—was first made by a private member, and he quoted a considerable list of subjects which had to be looked at as furnishing reasons for such a revision being undertaken.

There is, in the first place, the demand on the part of the provincial members that they should have a share in the direction of affairs, which, in the formula of the age, means a vote at elections and so on. At present they have this privilege, of course, if present at the meeting when the question is put; but it is idle to call this a vote if the voter has to come fifty or even five hundred miles to give it, when the post will deliver it for him in a few hours for a penny.

Then the Associates are asking for some reasonable share of power; and this request, whether it can be wisely acceded to or not, certainly must be courteously considered. A very sensible observation was made by one speaker, that Associates who are eligible for Fellows—by reason of seven years' practice—ought to become Fellows; so that, if it be only the older men of that class who now claim the franchise, this might be a fair answer.

Allusion was made next to the proposals which have recently been talked about respecting the desirableness of establishing a new professional society, as if to supplement the action of the Institute in these days of much flutter and little progress. Such a proceeding, if based upon any real need, might damage the prestige of the Institute, no doubt; but, what is of more immediate moment, we have already to deplore the remarkable circumstance that such leading men as Mr. NORMAN SHAW, R.A., Mr. BODLEY, A.R.A., and Mr. BUTTERFIELD, the gold medallist elect, the representatives of a whole class of more or less accomplished architects in London, and many of the leading provincial architects also, are at this moment holding entirely aloof from the guild. If it be any shortcoming in the constitution or administration of the Society that is to blame for such incidents, the question cannot be too soon gone into. In fact, we may add that the relations which subsist, or rather do not subsist as they ought, between the Institute and the Royal Academy, might be made the subject of another form of inquiry into the working of the charter, which certainly ought not to repel such men, but rather to attract their fraternal adhesion.

The whole principle of examination tests, it was urged, constitutes another subject for the most serious consideration. It is late in the day for such a body as the Institute of Architects to initiate examinations for admission when the practice has been almost overdone by societies of far less pretension, or none at all, to academical rank in the country. It would be easy enough to set up an illusory and invidious test for mere appearance sake, and so disparage a substantial professional qualification as to drive away some of the best class of men for ever. We cannot help feeling kindly towards an extension of the examination principle that is identified with the real advance of knowledge; but the case here is not a simple one, and must be investigated and discussed with the utmost care before any definite steps are taken in the present guild that perhaps cannot be retraced. Another question of the same order is the recently pronounced intention of the Institute to conduct test examinations for extraneous municipal bodies; a proposal excellent in its purpose, but not to be carried into effect without great caution.

Then there is the wide question of unionism, which no doubt must sooner or later be taken up seriously—whether or not the Institute is to become more effectually the headquarters of combined action in matters of professional business. Allusion might, indeed, have been made especially to the flagrant impropriety of what is called cannibalism, when one member accepts from a lawyer a retainer of "advocacy on oath" against another, to help in defeating his ordinary claims, or in throwing upon him extraordinary responsibilities, for the mere sake of turning the penny, an honest penny if it may be, but otherwise if it must.

But apart from all details, perhaps there are few who will be disposed to dispute the abstract proposition that the circumstances of the architectural profession have changed during the last half century almost beyond recognition, so that a charter of the date of King WILLIAM THE FOURTH may well

be looked at inquiringly if it is supposed in any way or by any class of interested persons to operate obstructively or even inefficiently. At the same time, we do not forget that Royal Charters are not nowadays denied the benefit of elastic interpretation when the advancing liberality of the age so requires. We are reminded that the charter was made for the Institute and not the Institute for the charter, and so long as the members run fairly well together there is no one to interfere, and they may do very much what they please with it. What we think most people will approve emphatically is the disposition to revise the practical working of the constitution, and the sooner this is acted upon the better.

### THE BUILDING TRADE GUILDS OF ROUEN.

ONE of the most urgent questions of the present time in England is that which relates to technical education. If we may judge from the elaborate and costly machinery which has been set up in the shape of schools, lectures, examinations, exhibitions, &c., and of which committees of amateurs constitute themselves the directors, it would seem as if the world had hitherto failed to discover how to produce an efficient workman. But in the benighted Mediæval period people had no difficulty in the matter, and in this country and in France they were able to insure that workmen must be either competent or starve. The means adopted will be thought primitive, but they were efficient. It was requisite for his own security that a workman should belong to the guild or company which represented his trade; but to obtain admission he had to demonstrate that he knew his business. He was examined by men who cared little for book-lore, but who were acquainted with the materials and processes of their craft, and if he failed to convince them that he was dexterous in using tools and prudent in dealing with materials, he remained an outsider. The knowledge that was needed was not to be acquired by cramming or by attending a course of agreeable lectures. However glibly a candidate might talk, he failed to persuade his inexorable judges. We may even conclude that if such a phenomenon existed in those days as a man who could discourse upon the history, political relations, or evolutionary development of his trade, the only impression that his oratory was likely to make upon his judges was to convince them that he was a quack.

It is fortunate that in Rouen there still exists sufficient evidence to enable us to understand what kind of tests were once employed in technical education. The records of many of the trade societies of that city have been preserved, sometimes by the modern representatives of the trade, or guild, sometimes by the public authorities. If the documents were translated in full into English, they would show how different the modern system of examination is from the Mediæval. The old-fashioned folks of Rouen knew nothing of tests which can be applied to whole batches of men at the same time, and in parts of the country which are wide apart. They tried their candidates individually, and, in doing so, may have regarded them in an unfriendly way as possible rivals; but, with all its defects, no better system than theirs has yet been substituted for insuring efficiency among workmen. We can only refer to what was done in a few of the trades.

The carpenters of Rouen were recognised under some very old statutes, which were consolidated by HENRY IV. in 1597, and revised in 1652 by the local Parliament. But the workmen do not appear to have had much reverence for the amended laws, and it was necessary for LOUIS XIV. to issue an edict enjoining a better observance of them. In the old days there was a hard-and-fast line around every craft. There seem to have been encroachments by the carpenters and the joiners on each other's provinces, and a long and costly law suit was commenced in 1732 in order to have the limits of the trades legally defined. The carpenters had in consequence to alter their statutes, which were approved by LOUIS XV. in 1739. It may be mentioned that in support of their case they presented His Majesty with an illustrated book on carpentry by MATHURIN JOUSSE. This author lived in the preceding century, and his "Secret d'Architecture," published in 1642, was one of the authorities employed by Professor WILLIS for his excellent paper on "The Vaults of the Middle Ages."

The statute of 1739 therefore represents to us the Mediæval economies of trade in a somewhat modernised form. Accord-

ing to it the Carpenters' Guild was henceforth to consist of masters who had been elected, and was to be presided over by a dean, who was to be a carpenter and over fifty years of age. The Mediæval character of the regulations is seen from the second rule, which says that if the orthodoxy of the dean at any time became questionable he lost his position. A syndic, twelve deputies, and four guardians were also to be elected to manage the affairs of the guild. To be eligible for election, the carpenter was to be a Frenchman by birth or a foreigner who had been duly naturalised. A candidate had to present a certificate to the guardians from his master describing the work on which he had been employed, and the guardians were bound to verify the statements by inspection. He must also prove that he worked four years as a journeyman after serving his apprenticeship. Then he was to undergo an examination into his manual skill and technical knowledge. The subjects were the sizes and qualities of the timber used in construction, the carpentry required in connection with foundations, demolition of buildings, support of party-walls and partitions (a subject to which great importance appears to have been attached); in fact, it had to be demonstrated that the candidate was competent to deal with all kind of work in which wood was employed. Afterwards he had to show that he could draw geometrical figures. Next he was to give proof of his practical skill, by working for a term of twelve weeks with two masters (six weeks with each) who owned carpenters' yards, and obtaining a certificate of capacity from them. But all this was not enough. A meeting of the craftsmen was to be held, and a majority was to determine what kind of trial piece the candidate was to undertake as a final test. It might be an example of a curved staircase, a vault, or a roof, of as difficult a kind as could be devised, and thus involve problems of descriptive geometry. If the candidate carried out the work to the satisfaction of his critics, then, on taking the oath and paying the examiners and society fees, he was admitted to the mastership.

Afterwards, if he worked on his own account, he was obliged to submit to regulations which were as strict as those of a modern trades union. A master could not keep an apprentice in his workshop for more than five or less than three years, without giving notice to the guardians of the guild. He was to employ no journeyman unless those belonging to the guild, exception being made in the case of those who were in the intermediate or companionship stage, and who were to stay for a short time only. He could undertake all works which were defined as belonging to carpentry—in houses, bridges, wine-presses, sluices, piling, cranes, capstans, the arms of windmills, &c., and he had the sole right of supplying the timber; but he was not to meddle with sculpture or other ornamentation. If he infringed the laws by executing joiners' or sculptors' work, he was liable to pay a fine of fifty livres, unless that work was done by him for his own house, and he was expected to give permission to joiners and sculptors to do carpenters' work under similar conditions. A journeyman was not allowed to leave a master until he had completed the work he had undertaken—so long as his wages were paid.

A contract for contractor's work could not be entered into by a man belonging to another trade, and *vice versa*, and architects in their estimates were obliged to price the different trades separately. In some respects the Rouen regulations had many advantages, for masters and workmen were compelled to concentrate their attention on their own craft; a high standard of workmanship was established, and the apprenticeship system was in reality a course of training instead of being one in name only, as it often is at present. But modern political economy would object to the restrictions which were placed on freedom of contract, and by which it was impossible for a man who was without any knowledge of building work to be entrusted with the erection of a house. The old masters and men of Rouen thought of work in the first place; in our enlightened age that position is given to finance, and so long as money is made or lost by somebody, the conditions of the game of life are supposed to be observed. The examinations of the syndics and guardians have developed into negotiations in the parlours of bank managers, and the only trial pieces which are now indispensable are proofs of solvency in securities.

In Rouen as elsewhere it is supposed that when a master mason is mentioned in an ancient document, the term is descriptive of the superintendent of works—the representative of the modern architect—for in Mediæval times there was no distinction between the thought and its realisation. There is

a passage in the register of the Chapter of Rouen for 1398 which relates to the institution of JEHAN SALVART as mason of the cathedral, which has been adduced in support of the theory. He was enjoined to well and faithfully manage the workmen, and do all other things that a good and faithful mason should do in such a case, without fear, favour, love, or hate. But it is supposed that the organisation of the Rouen guild of masons dates from the twelfth century, as it is related that in 1145 a body of masons left the city to construct the cathedral of Chartres. Afterwards all the Norman congregation of masons are supposed to have been invited into one society, which was employed in the Chartrain district, and, on returning, built and repaired several churches in and around Rouen. INGELRAM, the architect of the cathedral, was a notable example of the Mediæval master mason. He also worked at the Abbey of Bec, and his name is found in the chronicles thereof. To mention other names would be to write the history of Rouen architecture. The title of master of works was recognised until 1777, when FONTAINE the architect held the office, and, like many of his predecessors, lived in a house in the court of the Hôtel de Ville. In the eighteenth century there were fifteen or sixteen architects in the city who formed a society, which met in the Rue St. Patrick. Little is known of the working masons of Rouen. The trade must have had a guild—like all other trades—but, if so, the records are lost, or are enshrouded in the mystery which is associated with the craft of the *franc-maçon*.

Judging from the number of regulations which exist, the Mediæval plasterers would seem to have been carefully watched by the authorities of Rouen. In 1289, in 1319, in 1345, and in 1348 the mayors demanded reforms of the statutes of the trade. There were so many by-laws that it was difficult to know what was illegal. As plaster was largely used in the walls of houses, carelessness was dangerous. At length, in 1456, GUILLAUME GOMBAUT, who was Vicomte of Rouen, undertook the revision of the statutes, but he overlooked the necessity of consulting the masters of the trade, and in consequence there was a great deal of clamour against his amendments. Finally the plasterers gained the day. About twenty years later there was another attempt at reform; the masters were induced to take part in the deliberations, and as a result a new series of rules were prepared, and of which LOUIS XI. approved. In framing these rules the danger of fire in half-timber houses was kept in view, and therefore attention had to be given to the construction of chimnies. If there was any deviation from the rules the plasterer was fined, unless he could produce a special order from the owner of the building. An oven which was partly constructed of plaster could not be used until it had been examined by the officers of the trade, and they certified that it was constructed so as to avoid the risk of fire. There was a standard to determine the quality of the plaster, and any deviation from it was punished by a fine, the amount being arbitrary.

In Rouen there were three kinds of covering used for Mediæval houses. The poor used straw and rushes, the bourgeois used tiles, and slates were employed from the fourteenth century for the larger edifices. The men who did this kind of work were recognised under the name *couvreurs* in the reign of CHARLES VI., and, in 1410, through some exceptional liberality, they were allowed the right to use plaster conjointly with the master plasterers, but on the understanding that they recognised the authority of the guardians of the guild of plasterers. It deserves to be noted that the tilers and slaters, unlike the workmen of other trades, rarely worked on Sundays or feast days. The reason of this deviation from the ordinary custom was explained in one of their rules, which stated that as the masters and their servants ascended so high they placed themselves in jeopardy, and it therefore behoved them to hold the laws of God and of the Church in greater respect than other men.

From a statute which dates from 1507, it would appear that the painters and sculptors of Rouen were united in one society. Sometimes the artists are described as makers of images, and sometimes as stonecutters. Even the great JEAN GOUGON is called in the register of the Rouen chapter, "tailleur de pierre et masson." The tradition of art has always survived in Rouen, and has displayed its influence under varying conditions. From the seventeenth to the nineteenth century the city has produced many renowned painters and sculptors, such as JEAN JOUVENET, RESTOUT, DESHAYES, GÉRICAUT, DEFRANCE, SLODTS, JADOALLE.

The old rules of the artists' guild correspond with those which were enforced in meaner trades, and all possible care was taken to insure the best materials and workmanship. A painting was only to be executed on a new canvas made of linen or silk thread, and with enduring colours. For a statue the stone or wood should be selected with care. The guardians, who were elected by all the members, had the right of examining the works. If they found imperfections which could be remedied, they suggested the alterations; but in other cases they were authorised to destroy the picture or the statue. Admission to the guild was obtained by examination. The painters had to produce a picture measuring two feet and a half by two feet, while the sculptors had to carve a figure five feet and a half high of Our SAVIOUR crowned with thorns, a full-size figure of the Virgin and Child, or a panel with eight figures representing a scene from the New Testament.

The painters on glass had a guild of their own, but under similar rules to those described above. For example, a rule made in 1496 says that the candidate for admission is to produce two panels for trial pieces—one is to have for subject the Crucifixion, and the other a figure of the Blessed Virgin. It is plain, from what we have said, that in all the trade societies practical skill held the first place, and it was rightly considered that the best judges were men who, from their talents and experience, were recognised masters.

## LUXEMBURG.

[BY A CORRESPONDENT.]

TWO chronograms (giving the dates respectively of 1871 and 1851), cut in the rocks on the picturesque road from Luxemburg to Eich, and on the old *route des glacis*, record the dismantlement of what was once the impregnable stronghold of Europe, second only in importance to Gibraltar:—

ArVa patent, CeDVnt rVpes foVeæqVe repLentVr;  
eXsVLtiant CIVes, trVX qVà Mars ante fVrebat.

(Fields lie open, rocks yield, and fosses are filled up;  
The citizens rejoice where grim War used to rage.)

fIt VIa VI, CoLLes DIscEDite, sVrgItè VaLLes;  
asCensV faCILI sVperet IVga CeLsa VIator.

(A way is made by force, rocks cleave asunder, valleys rise;  
The traveller mounts high summits by an easy ascent.)

At the Treaty of London in 1867, the Great Powers, on guaranteeing the neutrality and independence of the Grand Duchy, stipulated that its fortified capital should be thrown open. The Grand Duke (the King of Holland) who guaranteed that this proviso was carried out, as far as might be possible with such a natural fortress, visited the city about this time last year, and gave his *quitus*, or certificate, that the work of dismantlement had been duly performed.

Though the origin of Luxemburg (Luxemburgum, Lützelburg) is shrouded in legend, wherein the Devil plays an important part, historians generally agree that the castle was begun by the Roman Emperor GALLIENUS, about the year 260. In the eighth century it was given by CHARLES MARTEL to the Abbey of St. Maximinus of Treier or Trèves. In 963 it was acquired by Count SIGEFROI of Ardenne, who gave in exchange a more valuable property, and afterwards repented of his bargain. He, however, restored the ruined walls and towers of the castle, and fortified what has proved to be the nucleus of the present city, which increased so rapidly that in 1050, and again in 1393, it was found necessary to extend the walls. It is not surprising that this accumulation of all the systems of defence from the Middle Ages to modern times, coupled with its situation on a rock, surrounded on all sides but one with a deep ravine, to say nothing of the good workmanship and materials which rendered powder necessary, should render its dismantlement a work of time and difficulty.

The one side not naturally fortified was, however, thrown open first of all by razing the walls. And then the city, which had been so long pent up, breathed again, as it were; and this long breath caused it to expand in a marvellous manner, and extend out into the country with a gradually increasing arc. The space formerly covered by casemated walls and embattled towers was laid out in smiling parks and promenades, which are yearly growing in beauty as the trees attain larger proportions. This year the prosperous state of finances enables the Government to set apart the sum of 100,000 frs.,

or 4,000*l.*, for embellishments to Luxemburg and its environs. The prevalent style of architecture is the Neo-Greek or French Renaissance; but a few Mediæval turrets appear here and there, as if they had been left from the olden time and were incorporated in the modern edifices. Such was the rage for building, when sites could first be obtained, that wages rose 20 per cent. higher than they are at the present time. Everybody wanted to build at once, and tried to outdo his neighbour. Means for this rivalry soon poured in abundantly; for, during the Franco-Prussian war, Luxemburg furnished supplies to both the armies, and many a fortune was made in six months. The value of private houses built since 1867 amounts to nearly 91,000,000 frs., or 360,000*l.*, and building is still being carried on in all directions on the outskirts, while in the centre of the city a number of historical edifices have been restored and transformed. Among the new public buildings, the Casino, built at a cost of 200,000 frs. (8,000*l.*), is quite an ornament to the city.

During the thirty-four years since 1849, no less than 120 churches and chapels have also been built in the country (only 979 square miles in extent), of which fifty-five were designed by the State Architect, M. ARENDT. Among these is the Chapel of St. Quirinus, in the low-lying suburb called Grund, at the bottom of the ravine, which was restored last year at the cost of the State. It is an old heathen temple, dating from the time of the Romans, and the place where the blood of the sacrifices was poured may still be traced. Originally a mere grotto, hewn out of the solid rock, it has now a façade of masonry, with turrets and pointed window. A curious external pulpit, triangular in plan, has also been preserved and restored.

Luxemburg, though the cradle, as it were, of many personages famous in history, is singularly destitute of statues. There is, however, one notable exception, in that of the beloved Princess AMELIA of Saxe-Weimar, consort of the no less venerated Prince HENRY of the Low Countries, who was the Grand Duke's representative between 1867 and 1879. The statue, looking towards the city, and surrounded by a green bower, is effectively situated at the end of the Avenue de la Princesse, at the park entrance. Mounted on a marble pedestal, it is placed in the centre of a hemi-cycle, reached by several steps, and is surrounded by a balustrade, with marble tablets bearing the names of the twelve cantons. The statue, cast in bronze, was modelled by M. PETRE, of Nancy.

Both the Prince and the Princess died at the château of Walferdange, an elegant structure, but without any architectural pretensions, that serves as the residence of the Grand Duke or his representative. The road from the city of Luxemburg affords some romantic views, especially that part between the capital and the pretty village of Eich. Here are some iron-works belonging to METZ & Co., the largest ironmasters in the country. Herr EMIL METZ, the manager, lately appointed President of the Chamber of Commerce, has made a collection of ancient hearth back-plates—called in French *taques de cheminée*—not merely from Luxemburg, but also from neighbouring countries. M. ARENDT has also a few that are very curious. The Luxemburg Hôtel de Ville contains the collection of ancient and modern paintings and works of art left by PESCATORE to the city. A museum of antiquities is attached to the public library, which contains many rare manuscripts.

### PARIS NOTES.

M. TROUILLEBERT has been authorised by the Tribunal of the Seine, in his action against MM. Tedesco Frères, to produce evidence to show that he was the painter of the picture *La Fontaine des Gabourets*, the attributing of which to Corot gave rise to the suit. As forty of his landscapes are to be sold shortly at the Hôtel Drouot, the public will have to decide upon the merits of his work before the judges and jurymen who are dealing with the particular case in litigation, and the result of the sale is looked forward to with no little interest in artistic circles.

In the competition for the Duc Architectural Prize, worth 4,000 frs., only three sets of plans were sent in, one by M. Armand, of a residential villa; another by Albert Ballu, of the new Law Courts to be erected at Cherbourg; and a third by M. Vandozer, for a bridge of fine arts. The architectural section of the Academy has decided to divide the prize equally between the two last-named

competitors. The plans were on view to the public from Friday to Monday last in the Caen Museum at the Institute.

The Salon Jury of Sculpture has elected M. Mathurin Moreau, president; M. Thomas, vice-president; MM. Etienne Leroux and Blanchard, secretaries. The task of examining exhibits was commenced last Monday.

The Spanish Government is said to be on the point of demanding the permission of the French authorities for the removal to Madrid of the remains of Goya, the celebrated painter, from Bordeaux, where they now lie in the vault of the Gojchea family at the Chartreuse cemetery. The tomb is not well kept, and the Latin inscription composed by Don Pio de Molina, the alcade of Madrid, and a friend of the painter, is scarcely legible. In 1824 Goya came to Bordeaux from Spain, went on to Paris, where he found his old comrade David, struck up an acquaintance with Vernet, returned to Bordeaux, and remained there until his death in March 1828.

The Prefect of the Seine has given his sanction to the erection of a statue of Berlioz, the musical composer, in the centre of the Place Vintimille. He has also authorised the placing of a statue to Dr. Paul Broca in front of the Medical School at the corner of the Rue de l'Ecole de Médecin and the Boulevard St.-Germain, with the proviso, however, that should it become necessary to widen the street, the Anthropological Society, who are erecting the statue, shall bear the expense of shifting it.

The annual general meeting of the Society of French Painters, Sculptors, Architects, Engravers, and Draughtsmen is to be held this day (Saturday), at two P.M., at the Ecole des Beaux-Arts, under the presidency of M. du Sommerard, a member of the Institute. The report for the year 1883 will be read by M. Guillaume Dubufe, and one-fifth of the managing committee will be renewed by election.

In a newly-published French work, "*Souvenirs du Règne de Louis XIV.*," by M. de Cosmac, we find some curious correspondence between M. de Bordeaux, French Ambassador to England, and Cardinal Mazarin, relating to the purchase of tapestry, pictures, marbles, and other art treasures belonging to Charles I., which were put up for sale in 1650 by order of the Parliament. The majority of the pictures and most of the tapestry purchased by the Cardinal at this sale, and taken over to embellish the Palais Mazarin, are now to be found either at the Louvre or in the National Collection of Furniture known as the Garde-Meuble. It is interesting, therefore, to find mentioned in the correspondence above referred to some of the prices paid on that occasion. Correggio's *Antiope* was secured for 4,500 livres (the livre is about equivalent to the present franc); Titian's *Venus del Pardo*, 7,000 livres; Raphael's *St. Michael and St. George*, 2,000 livres; the same painter's *Portrait of a Young Man*, 1,000 livres; and Jules Romain's *Triumph of Titus*, 800 livres.

The magnificent tapestry representing the "History of Abraham," executed according to the designs of Vouet, and estimated to be worth 40,000 livres, was considered too dear by the Cardinal, who refused to buy it. This reserve price proved, moreover, higher than anybody in England appeared able to afford at that epoch, and the work was allowed to go to Spain. It turned out that the cautious churchman had acted wisely, for it was presented to him later on by Philip IV. on the conclusion of the Peace of the Pyrenees.

Still another relic of old Paris is doomed to disappear. There exists in the Rue Nicole—a small street running parallel to the Rue St.-Jacques, and ending on the Boulevard de Port-Royal—a pretty little chapel of the time of Louis XIII., known as the Chapelle de la Vallière. It was in this miniature place of worship that the unfortunate mistress of Louis XIV. performed her devotions when she became a Carmelite nun, after the transfer of the fickle monarch's affections to Madame de Montespan. The convent close by in which she resided has long disappeared, and the chapel itself is now threatened with demolition. A suggestion, which it is to be hoped may be adopted, has been made that it should be removed to one of the public gardens, such as the Luxembourg, which is not far off.

Church robberies in Paris and its suburbs have been very frequent of late. Many have been perpetrated under circumstances of singular audacity, and, although the object of the thief is, of course, convertible plunder, they generally manage, in addition, either inadvertently or out of pure wantonness, to do great damage to the art treasures with which these edifices are crowded. Thus, last week some parties, as yet unknown, obtained entrance to the church of St.-Germain-l'Auxerrois by breaking through the priceless stained-glass windows on the side of the Rue de l'Arbre-Sec, and descending from the opening thus made into the body of the church by means of a rope. Six offertory boxes were either picked or broken open, and their contents, averaging about twenty francs, abstracted. The thieves left hammers and scissors behind, and the rope which they had used was found attached to the bars of a window opening upon the Rue des Pretres-St.-Germain. The vestry had also been entered, but the thieves had not been able to force the cupboards, and nothing was taken from this portion of the church.

#### OFFICIAL NOTES ON FOREIGN TRADE.

**D**URING the year 1883 the sum of 88,000 frs. was expended in the completion of the tide harbour works at Brest. The dredging of the harbour to a depth of 7 mètres 50 centims. below the lowest tide was also terminated. The long promised dry dock, so much needed in a harbour of refuge like Brest, has, however, not yet been commenced, which greatly interferes with the repairs of shipping, so frequently entering the port with serious damage. The facilities for repairing ships, save in the Government Dockyard, remain stationary and without any signs of early improvement, a fact most detrimental to the commercial interests of the port. The construction of two quays has been commenced at Paluden. The masonry for a lighthouse—to be worked by electricity—has been completed at Créach, in the Island of Ushant. Plans are being prepared for the construction of a quay and other works at Lorient, which will cost 500,000 frs. Save the erection of numerous school-houses in the three departments of Finistère, Côtes du Nord, and Morbihan, and the improvements of roads in the interior, no public works of importance have been lately undertaken; and those commenced in 1882, such as new boulevards at Brest, &c., have not made much progress, especially of late, in consequence of the unfavourable financial position in the Finistère.

The present financial and commercial state of affairs in Brest offers an advantageous opportunity for the establishment, not only of a bank conducted with capacity, prudence, and with ample funds, but of a mercantile firm or association possessing a clear capital of from 10,000l. to 15,000l., and determined to break with the antiquated system of providing the whole department of Finistère with a large portion of its requirements from Paris, and other distant interior towns of the country, in lieu of drawing them from more direct sources—a system making their cost, saddled with heavy expenses, exorbitant, and Brest, as a residence, one of the most expensive cities in France.

It is reported from Cherbourg that the importation of Portland cement has more than doubled in the last year. This is due mainly to the dry dock and other works being carried out in the arsenal; but notwithstanding that companies have been formed in France for the manufacture of imitation Portland cement, the appreciation of the British cement is steadily increasing, so that it is supposed that the introduction of this article will continue on a large scale.

The preliminary concession granted to Mr. Grainger to establish a system of tramways at Cherbourg is now about to become definite, as the scheme, though curtailed, has been submitted to the public for their verdict of *commodo* or *incommodo*, and it is certain their decision will be favourable. As now proposed the tramway would commence at Tourlaville, whence it would be carried by the suburb of Val de Saire to the drawbridge, thence follow the eastern quay of the floating-dock to the railway station, and then continue by the western quay of the dock through Cherbourg to the entrance of the arsenal, whence it would be prolonged to Equeurdreville and Querqueville, the total distance being about 11 kiloms. The fares proposed, subject to the sanction of the Government, are:—First class, 10 cents for first kilom. and 5 cents for each subsequent one, no fare to be less than 15 cents; second class, half the above, no fare to be less than 10 cents. Military and sailors in uniform half-price. Persons employed in the arsenal, in or out of uniform, are to be conveyed from either end to the arsenal in the mornings, and *vice versa* in the evenings, at the rates of 20 cents first class, and 10 cents second class. It is confidently expected this tramway will be undertaken in the present year. When completed it is calculated to confer benefit on the arsenal workmen, in saving them the wearisome walks to and from their work, and giving them more time to attend to their own affairs.

The success or otherwise of the enterprise depends upon the circumstances as to whether the mode of conveyance proposed will be popular with the workmen—a question which is not devoid of an element of uncertainty.

The timber merchants at Honfleur overstocked themselves in 1882, and consequently the imports of timber have decreased. In 1883 38,600 standards of deals and timber were imported from Russia, Sweden, Norway, Canada, and the United States, against 44,500 in 1882, and 38,700 in 1881; 8,500 steres of oak timber from Germany, against 16,500 in 1882, and 10,500 in 1881. There was some improvement in timber for railway works. Ninety-five thousand sleepers were imported from North Germany, against 33,500 in 1882, and 64,300 in 1881. The works on the new dock at Honfleur, which is 400 mètres long, and will be prolonged 400 more, are actively carried on. The extension of the dock will cost 600,000 frs., towards which the Chamber of Commerce gives 200,000 frs. The Chamber will also supply two steam and four hydraulic cranes, and will construct a patent slip, and a shed, 175 mètres long, to warehouse merchandise in. These improvements will cost 1,200,000 frs., but no extra charge will be levied on shipping, only the 45 c. quay dues now levied will be continued.

The Palais de Justice (the old Normandy House of Parliament) has been completed on the Rue Jeanne d'Arc side, at Rouen, and is very creditable to the architect, who has so well followed out the example of his predecessors in the fifteenth and sixteenth centuries. The new museum and library in the Rue Thiers, inaugurated some two or three years ago, is now being considerably enlarged on the side overlooking the Solferino Gardens, and there are new cavalry barracks being built on the St. Lever side of the river. An exhibition building is in the course of construction on the Champ de Mars, for the industrial produce of a region of twelve Departments. All the available space is bespoken, and there is to be, besides the useful, an exhibition of works of art, and it is expected that it will be opened some time in the course of the summer.

The works for the enlargement of the port of Dieppe, which were commenced in 1881, are not being carried on with great rapidity, but still a certain progress is being made. They consist chiefly of the setting back of the east pier in order to obtain in the channel a minimum width of 70 mètres; the lengthening of the west pier; the reconstruction of the quay wall of the steam packets; deepening the channel by 2.50 mètres, by dredging both inside and outside the port; cutting a new channel through the suburb of the "Pollet," to gain access to a new outer basin, to a half-tide dock, and to a floating dock to be constructed in the present retenue; the creation of a dry dock—the flood-gates are to be 18 mètres wide, and their sill will correspond with the level of zero of the charts. The work of setting back the east pier, and of the construction of the new docks will probably be completed in 1885.

A sum of 80,000l. has been credited to the works on the floating basin of St. Malo for the year 1884, and it is expected that the basin will be opened to shipping towards the end of the year. In the outer harbour of St. Malo the reconstruction of the great landing slip (so called) of Dinan, which serves chiefly for the traffic carried on by steamers and ferry-boats going to and coming back from Dinard, has been completed. A survey is being made of the jetties used at low water in order to ascertain by what means they can be improved, but no decision has as yet been come to. The rebuilding of an old embankment of about 330 yards in length, which on the north side protects the row of low sand-hills which extend from St. Malo to Paramé, and which afford shelter against the encroachment of the sea to the extensive lands behind them, is to be undertaken this year.

In Brindisi solicitude has been awakened in regard to the unsatisfactory state of the harbour. The annual grant of 80,000 fl. for the necessary repairs, dredging, &c., has been replaced by a lump sum, given by the Government to last over a period, for putting existing works into thorough repair and carrying out new ones. A new embankment in the inner harbour is to be made, and the existing coal wharves at the entrance to be transferred to it, and thus disoccupy, enlarge, and deepen the entrance by dredging. Besides these works, about a third of the existing embankment is to be replaced by a new one of concrete blocks. This latter work has already been commenced. But in view of what is proposed to be done, and done efficiently, as it is desirable it should be, the grant of 500,000 frs. is considered inadequately small.

A report from Berdiansk, in Russia, states that new and very extensive shops have been built, and large stocks of goods brought down from Moscow and other towns. The civilised custom in large towns of having attractive and expensively fitted-up shops is

gradually becoming recognised there, and the business transacted appears to improve in proportion. Concerning ironmongery goods, it may be said that some improvement is noticed in the quality of Russian make; but it is remarkable how difficult first-class goods are to be obtained. Of course, the market does not require any very superior quality; cheapness is the great point. A great scarcity is always noticed of the celebrated Demidoff iron. A slight increase in price is made almost every year, but still the supply is deficient, and shopkeepers are unable to obtain all they require. Foreign iron is not kept in stock, nor would it be saleable. Immense progress is being made amongst the German colonies in the district. Steam flour mills, starch factories, breweries, machinery works, foundries, and other industrial occupations employing thousands of hands are to be found, and the class of workmen and mechanics are vastly superior to those of a few years ago.

### SIR F. LEIGHTON ON SCOTTISH ART.

A BANQUET was held in the Drill Hall, Forest Road, Edinburgh, in connection with the tercentenary commemoration of the University. The toast of "Literature, Science, and Art" was proposed by Earl Wemyss, who described the President of the Royal Academy as a highly-cultivated English gentleman, a great orator, whose powers of speech were as highly finished as his painting; a sculptor, the admiration for whom would endure as perennial as the bronze of his great work—a man struggling with a python.

Sir Frederick Leighton, in responding, said:—Although the command to respond in the name of art is not laid on me now for the first time, never has it been laid on me under circumstances approaching in interest and significance those under which this spacious hall is thronged with guests to-night. To dwell upon the profound signification of the celebration which has gathered together such an illustrious assembly in the Athens of the North would be in me obviously an impertinence, but I would ask leave to say that to be permitted to respond to a toast on such an occasion is an honour which I prize very highly, and that honour is much enhanced by the characteristically graceful and eloquent and indulgent words of my friend Lord Wemyss. Sir Alexander Grant, acting in the name of a most distinguished body, has beckoned to the four quarters of the globe, and from the four quarters of the globe, from the far ends of this Empire, and from every land in which intellect is held in reverence, men to whom that reverence is common have been gathered into your northern city to do homage to the famous seat of learning of which he is the head, to bear witness to its high service in the past and in the present over every field of thought, to hail with augury of undimmed renown its entry upon this fourth century of its career—some of them to receive a distinction which will not be least among the sources of their pride. My gratification at having my name coupled with this toast is far from unmixed, for I have been bidden to rise immediately after two men of world-wide fame, and though I am, indeed, proud that, mainly, no doubt, through the accident of my official connection with the Royal Academy, I am permitted for the nonce to be *in solchem Bunde der dritte*, I am disturbed by a sense of unworthiness to be so honoured, a sense which is not wholly effaced by the kind words with which my name has been brought before you. I have, nevertheless, one sense of comfort—there is one grace with which to deck my words, and I propose to use it largely, and that is the grace of brevity. Custom has long sanctioned the union in one toast of science and literature with art, and, as it seems to me, rightly, for whilst these beneficent forces work by methods widely different, and have each their separate and clearly marked domain, yet they do not work in enmity, but rather with mutual aid and interchange of service in the building up and illuminating of our spiritual life, each bringing to us its special ray of light from the great central flame of truth, all three together purging our minds of the error, if it exists, that any one of those rays is the whole truth, and keeping alive in us the sense that these are many and manifold waves from the far-hidden central source of light towards which men strain their eyes for ever and in vain. Between science, the seeker after the causes of what is, and those graphic arts whose vehicle of expression is the outward semblance of things, the gulf might seem to be almost impassable; but do we not see standing between them a noble link, an art which binds and blends in harmonious consent the achievements of science, the flights of the imagination, and every fascination of form and colour? I speak of architecture. Between literature and art, on the other hand, the links are so obvious that in any case which is not characteristically artistic the danger is great, lest the outlines of their several provinces may become blurred, to the detriment of both, but especially of art. Both have, indeed, man and nature for their theme; both strive to clothe in forms of beauty poetic emotions and noble thoughts; but to the one time is assigned as its field, and to the other space. The one leads us along through chances and contrasts of successive feelings and events; the other attracts us by the contrasts and harmonies, and by the emotions arising out of them, of forms which are embraced at one glance and at one moment, and these limitations

cannot be ignored with impunity. The arts to which the toast alludes are no doubt those which are conventionally called the fine arts. There is, however, yet another art not included in it, but which it is impossible to shut out from our minds when we are considering the relations of intellectual and imaginative forces—namely, the art of music, in which more than in any other they are closely welded together. Music flings across a warp of purest science a fiery woof of passion. Like literature, music unfolds her riches in a lengthened chain; like art, she deals with abstract qualities of form, and she has in melodious sound the very counterpart of colour. I am the more bound to say this to-night—indeed I say it on all occasions—for according to my creed, which is perhaps rather an obsolete one, but according to my firm belief Art is at her noblest when she and her sister Music are most closely kin. I am presuming on your patience, but I would ask before sitting down to be allowed to express my very warmest wishes for the thriving in this land of the arts for which you have permitted me to speak, and I do so with fraternal sympathy, not only as one who boasts himself a member of the Royal Scottish Academy, but as one mindful of the honour which Scottish artists have reflected and are reflecting upon that great institution which it is my pride and privilege to represent here to day. One of the most striking characteristics, if I may be allowed to say so, of Scottish art is its tenacious nationality. We live in days in which national individuality in art is readily blurred, and the tendency to absorption, as far as this kingdom is concerned, in the voracious Babylon by the Thames, cannot but add dangers to the levelling spirit of the age. You must recollect with the more pride that physiognomy of Scottish art retains in the South its sharply defined features. Many elements have conspired to make that art what it is—the strenuous and original temper of the race, the various elements of which that race is composed, the influence, perhaps, of contact in days when art was young with an eminently artistic foreign people; but, above all, the rare charms of the scenery in the midst of which it has grown. True it is, if I may whisper it at this table, that the heavens weep as often as they smile; I dare not say more often at these enchanted scenes, and that shadow follows sunbeam more swiftly than sorrow treads upon the heels of joy. But these vicissitudes in the shifting tempers of the sky only deepen, as I think, the enjoyment of those intervals of splendour that transfigure all your land. Speaking as one who has seen many lands, under many skies, and who has sojourned on three continents, I say, and I say it without hesitation, that in none is colour so royally supreme as in your own country, when the sun's gold is shed on your purple hills, and when the corn stands yellow along the steel-blue lochs. These are the glories in which genius has dipped her many-tinted wings. May she soar on those wings to further and yet more brilliant flights.

### A CONVERSATION WITH MR. RUSKIN.

A CORRESPONDENT of the *Pall Mall Gazette* reports a conversation he has had with Mr. Ruskin, at Brantwood, near Coniston. He describes Brantwood as a beautiful, rambling house with spacious rooms and low ceilings, commanding a view which is unsurpassed in England for picturesqueness and poetic beauty. In the drawing-room dwarf and other book-cases stand against the walls, and there are drawings by Prout, D. G. Rossetti, and others, as well as Mr. Ruskin's drawings of the interior of St. Mark's, at Venice. The library is enriched by a greater profusion of works of art. Numerous exquisite water-colours of Turner hang around the room, a marvellous example of Lucca della Robia's faience ("fashioned by the master's own hand and absolutely perfect," Mr. Ruskin said) decorates the chimney-piece, book-cases and drawers full of minerals line the room, and beautiful books are scattered about in artistic confusion. Mr. Ruskin showed some of the "lions" of Brantwood to the correspondent. He went to one of the cases and pulled out a drawer containing blocks of stone in which were large masses of dark-blue opal. "There! never before, I believe, have such gigantic pieces of opal been seen, and certainly not possessing that beautiful dark-blue colour. Oh, yes! I'm very strong in stones; my collection of agates is the finest in the kingdom, and I am at present assisting the British Museum in this department. The diamond I am at present exhibiting at the Museum is unique in crystallisation on that scale—I gave 1,000*l.* for it. But look—look at these books." The volumes to which he pointed were the original manuscripts of several of Scott's novels. "I think," he said, taking down one of them, "that the most precious of all is this. It is 'Woodstock.' Scott was writing this book when the news of his ruin came upon him. Do you see the beautiful handwriting? Now look, as I turn towards the end. Is the writing one jot less beautiful? Or are there more erasures than before? That shows how a man can, and should, bear adversity. Now let me show you these beautifully engrossed manuscripts of the tenth, twelfth, and thirteenth centuries. I know of no stronger proof of the healthy condition of the Church at that time than the evidence of these books, when they used to write their psalm-books so beautifully, and play with their initial letters so artistically. Yes,

the faces in all such manuscripts are very badly drawn, but that is because the illuminators were rather sculptors than artists—in our sense of the term." The correspondent continues:—This reference to art encouraged me to ask what he thought of art in England at the present day? Mr. Ruskin shook his head mournfully. "I have only stopped grumbling because I find that grumbling is of no use. Besides, I am afraid of an action for libel—as in the case you know of—if I open my mouth; and if I cannot say what I choose about people I do not look at them. I may briefly say that I believe that all the genius of modern artists is directed to tastes that are in vicious states of wealth in cities, and that on the whole they are in the service of a luxurious class who must be amused, or worse than amused. I think there is twenty times more effort than there used to be, far greater skill, but far less pleasure in the exercise of it in the artists themselves. I may say that my chief feeling is that things are going powerfully to the bad, but that there may be something, no one knows how or when, which may start up and check it. Look at those drawings of Turner—there is nothing wrong in them; but in every exhibition there is something wrong; the pictures are either too sketchy or too finished; there is something wrong with the man—up to the very highest." "Are you satisfied with the result of your teachings?" "Certainly not! not in the least; I have made people go wrong in a hundred ways, and they have done nothing at all. I am not," he went on, rather bitterly, "an art teacher; they have picked up a few things from me, but I find I have been talking too much and doing too little, and so have been unable to form a school, and people have not been able to carry out what I say, because they do not understand it."

"Yes, I give far more care to my lectures than to my books. They are for the most part written most carefully, though I sometimes introduce matter extemporaneously in the delivery of them. I have taken more pains with the Oxford lectures than with anything else I have ever done, and I must say that I am immensely disappointed at their not being more constantly quoted and read; and this applies not only to the last series of my Oxford lectures, but to them all. What have I ever done better than this?" As he spoke Mr. Ruskin took down a volume of his "Aratra Pentelici," and read the concluding passages of one of the lectures in his own powerful and impressive manner. "There," he said, closing the book, "I have never written more closely than that, and they will recognise this one of these days. And I may tell you a piece of news: if I am spared another six years I shall have a school of my own. Turner liked the Royal Academy, and he was not often wrong. Its members have always been very kind to me, and I believe to everybody else. But its fault is that it is not an 'Academy'; it sets an example of no style, and it teaches its pupils no principles."

At this moment the clouds, which had obscured the sun hitherto, rolled away. "Now," cried Mr. Ruskin, "you will be able to see the full beauty of the view. Come and look at it from the dining-room: it is finest from there." Then, turning from the window, he called my attention to several pictures that the room contained. "Do you see that picture inscribed 'J. W. M. Turner, sua manu'?" That is a portrait of himself when he was only sixteen. That is a grand Titian—that old Doge over there; and this picture, which recalls Sir Joshua's *Banished Lord*, is a portrait of my father by Northcote. I always rejoice to think that my father had the good taste and the good sense to have his portrait painted by so clever an artist. He was no mean draughtsman himself." As we passed back to the library, he continued: "Prout, of whom you have seen several beautiful examples here, is one of the loves which always remain fresh to me; sometimes I tire somewhat of Turner, but never of Prout. I wish I could have drawn more myself—not that I should have done anything great; but I could have made such beautiful records of things. It is one of the greatest chagrins of my life."

"Can you tell me anything," I asked, "with respect to Lupton's failure to satisfy Turner in mezzo-tinting his *Calais Pier*? You no doubt saw Mr. Lupton's letter on the subject the other day?" "The truth," said Mr. Ruskin, "is very difficult to get out of any expression of Turner, and I believe that he was very apt to be dissatisfied when he saw the colour of his pictures in chiaro-oscuro. I know the facts of the case well; and I think that there was nothing that Lupton could not do. Assuredly Turner did not mean to imply that there was any incapacity in his engraver at all; but when colour is altered to black and white it often happens that the relative size of the objects appears to be altered too."

"Now that I am getting old," said Mr. Ruskin, in reply to a question of mine, "and can climb about the hills no longer, my chief pleasure is to go to the theatre. I told you just now that I could always enjoy Prout; in the same way one of the only pleasures in my life entirely undiminished is to see a good actor and a good play. I was immensely pleased with 'Claudian' and Mr. Wilson Barrett's acting of it; indeed, I admired it so much that I went to see it three times from pure enjoyment of it, although as a rule I cannot sit out a tragic play. It is not only that it is the most beautifully-mounted piece I ever saw, but it is that every feeling that is expressed in the play, and every law of morality that is taught in it, is entirely right. I call that charming little play 'School' entirely immoral, because the teaching of it is

that a man should swagger about in knickerbockers, shoot a bull, and marry an heiress. As regards the literature of modern plays, I think that in comedies the language is often very precious and piquant—more so in French than in English pieces; but I know of no tragedy, French or English, whose language satisfies me."

"The main work of my life, said Mr. Ruskin, "and it will be continued to the end of it, is the ecclesiastical history that our fathers have told us, and the natural history connected with my mineralogical collections. I am writing various catalogues in illustration of these collections, which I am giving my best time and care to. Besides, I am still editing Miss Alexander's book. Look at her drawings," he went on, as he drew some of her illustrations from a cabinet. "Never before have I seen such perfect penmanship—to say nothing of her knowledge of the flowers she draws. Now, before you go come up to my bedroom, and I will show you something worth seeing." He led the way upstairs, pointing as he went to some of Turner's sepia drawings which decorated the staircase. "From this room you will get the finest view of the lake. But it was not for that I brought you up. Look round at these masterpieces on the walls. There are twenty of Turner's most highly finished water-colours, representing his whole career, from this one, when he was quite a boy, to that one, which he executed for me. There is not one of them which is not perfect in every respect. I am much exercised as to how I shall leave these beautiful drawings after my death, so as to be of the greatest service to the public. As it now stands, in case of my sudden death they will all go to Oxford, but I cannot quite make up my mind as to what is the best to do. Here you see what is probably the most beautiful painting of fruit that Hunt ever did, and it hangs among the Turners like a brooch. Yes, I hold this to be the finest collection of perfect Turner drawings in existence—with one exception, perhaps; and the nation shall have it."

## STEPS AND STAIRS.\*

THE everyday ordinary things which we deem of little importance often contribute most to our ease and enjoyment. So also the simple devices which we think not worth the while to study or understand in very many instances lead the way to knowledge and wealth. How commonly it occurs when our attention is thoughtfully called to the origin or appearance of some very familiar object, to its ancientness, usefulness, or beauty, as it may be, to exclaim in our amazement, "How singular we never thought of that before!" As queer and yet commonplace a subject as could well be imagined is the one which I have chosen, and to which the above remarks may be applicable. Ask the question—how many have considered or even thought of it, or if they have, could conceive of anything surpassing, in connection with great antiquity, a device more useful and simple than the ordinary common building step, or, in a little broader sense, "Steps and Stairs"? It is not a little difficult to believe that while man, through his ingenuity, has attained the position he now enjoys, especially in architecture, after ages of experience, he has in steps and stairs made no proportionate progress, and that the primitive modes of ascent and descent remain in almost every respect the same to-day as they were thousands of years ago. Even the open ladder, with its rounds and sides, which we see everywhere, is but the counterpart of that which was used by the builders while rearing in gorgeous majesty those glorious edifices the ruins of which command the admiration of the appreciative world. With these same kinds of ladders or steps did besiegers scale the walls of the beleaguered cities and fortresses, and in the softer amenities of life did many a Romeo, no doubt, gain his Juliet's balcony, ages and ages ago. In the cathedral at Nuremberg there is very cleverly worked, in the architectural decoration of the canopy over the pulpit, an idea of a ladder, suggested, it is supposed, by the story of Jacob's dream, and therefore deemed as ecclesiastically appropriate by the sculptor Kraft, who flourished about the end of the fifteenth century. The steps and raised terraces which are so commanding and pleasing in our realisation of a grand and imposing structure, are the old-story similes, only diminutive in comparison to those of the temples away back in the remoteness of the Egyptian Ptolemies and Rameses; upon whose steps, courts, and pavements, dynasty after dynasty trod, knelt, worshipped, and passed away. The temples of Assyrian greatness, almost sublime because of their elevation, owed their grandeur to the countless steps and numerous terraces by which they were approached. The vast amphitheatres—the Coliseum and that of Verona and others—with their dark masses of elliptical masonry, tier upon tier of steps and galleries, are greater than modern science has built, and as good as we can construct even now out of the same materials. Nothing simpler or more suitable could be devised than these benches of stone. Nor does it seem possible that they can ever be supplanted by any substitute. The idea of a step is identical with our first efforts to creep. Nature shaped it in the eternal rocks, and it shall for ever endure. It is true that the

\* A paper by Mr. Walter Dickson, architect. Read before the Albany Institute, March 9, 1884, and printed in the *American Architect*.

modern lift or elevator has become both fashionable and necessary in meeting the requirements of crowded cities and lofty buildings, but even this contrivance is rarely under any circumstances inserted or used to the exclusion of steps and stairs.

If we for a moment consider how many questions there are involved in the planning of a good stairway, the constructive problems concerned in its execution, and its importance as a subdivision of a building, we cannot but see that it is a subject which demands the greatest attention. The mechanical construction of detail, of which this paper, at this time, does not intend to treat, belongs to the science of stereotomy, *i.e.*, of cutting solids to certain conditions of structure and equilibrium. Without some knowledge of the principles of this science no one can successfully cope with the difficulties to be encountered. It seems to be a law of nature that the sectional angle of steps should not vary from 45 degrees, and that a step is best proportioned when its top plane or tread is twice as wide as the rise or step itself is high. Assuming that the most convenient, easiest pace of average people upon level ground is 24 inches, and that 12 inches is the most natural height to rise when the ascent is vertical, and with this distance to govern the movement in ascending or descending steps, a rule asserts itself, which requires that when the riser or step is higher than one-half of a foot, or six inches, that the top plane or tread must be less than one foot in width, and that when the riser or step is less than half of a foot or six inches in height, that the top plane or tread must be wider. For instance, if a step, taking eighteen inches as a controlling factor, were six inches in height, the tread or top plane would be twelve inches in width. If the step were eight inches in height, the tread would be ten inches in width. If the step were four inches in height, the tread would be fourteen inches wide, and so on, &c. Furthermore, it is a fact, both remarkable and paradoxical, that a stair which is very easy of ascent is not always so of descent.

In any building the stairway claims an incontestable right, and next to the entrance is the most useful and prominent feature. Staircases, says Palladio, will be perfect if they are spacious, lighted, and easy to ascend. How many are there already built, and daily being constructed, which will bear the scrutiny of such ruling? How many are spacious, well lighted, or easy to ascend? In connection with the above desirable qualities might be asked the all-important first and foremost question: "How many are safe?" Safe for human lives, because of their strength; safe because of their protection against fire and disaster. It would be an almost hopeless task to ascertain the origin, early construction, and gradual artistic development of the staircase. It has been found located for most part in all of the noted remains of ancient architecture, but occupying remote and obscure places. The fact has been thought singular that Vitruvius throws no light upon staircases, and that the discoveries of Pompeii are equally as silent. This, in a measure, may be accounted for, because of the ancients building their temples and houses but one storey high, and enjoying their balmy climate on the terraced roofs, balconies, and walks. During the existence of the Roman empire especially, and in the decadence of the Republic, the residences of the rich were built with the most extravagant appointments. As the middle classes at the dawn of civilisation rose in power, domestic architecture began to develop. The skill of the Romans throughout Europe became widespread, and the principles of the Roman villas guided the builders in the planning of the houses of the Middle Ages. Yet, even in the residences of the wealthy, the stair when used was but a number of steps, very confined, exceedingly steep, rude, and narrow. When, for comfort or protection, buildings were built with more than one storey, circular steps or stairs began to be adopted, which revolved, as it were, around a solid newel, in shape not unlike a corkscrew, and were known by the name of "turnpike" stairs.

However, there are no known examples wherein ancient stairs ever corresponded in grandeur with the modern staircase. It was not until the twelfth or thirteenth centuries that architecture began to show a healthy development, and later, about the middle of the sixteenth century, that stairs and staircases attracted much attention. Sir Henry Wotton, who was much interested in the subject, says: "To make a complete staircase is a curious piece of architecture." Sir Henry's plan was a straight vista of staircases, each with landings receding from the other, from lower to uppermost storey. Since that time an elegant staircase has been acknowledged the most useful and most decorative feature in the interior arrangement of a building. In noble edifices, more particularly, the corridors and staircases impress us as to appropriateness and magnificence: by first impressions we are fain to judge of the whole, when, in fact, we have seen but a part. It is equally true of the stairs in our houses. If, when entering, we are to be favourably impressed, our halls and stairways must possess all of the attributes of space, symmetry, strength, and adaptation.

I here take the liberty, for which I trust I may be pardoned, to say that the departure from these rules in the arrangement of our dwellings is one of the glaring mistakes of our profession. Narrow, dark halls and cramped-up stairs now exist, where there should be a generous amount of walking, moving, and standing room; where the life-imparting properties of good wholesome air could circulate from basement to skylight, and each room opening

into said halls could receive its fresh supply; where daylight could shine in to brighten up the darksome interior of the house; where the stairs should be ample and easy, with frequent landings, so that the aged, the women, and the children, and the crowd itself, could make a hasty exit without fear of broken necks or limbs. Yet, not always is the architect or builder free to exercise his own taste or judgment in the planning of them. On the contrary, they are oftener forced to exert their greatest skill and ingenuity in combating surroundings and conditions which impede and are antagonistic to safety, convenience, sanitation, and good taste. For it must not be lost sight of that in earning his livelihood, the architect has very often to serve two masters—one his art's inspiration, his labour of love; the other, the inflexible exactions of his sometimes uncultivated client.

It is obligatory upon us to construct securely and to exercise every precaution for the safety and protection of life and limb. No retribution is too severe for the man or body of men who build for selfish gain, to the disregard of such precautionary measures. The day is close at hand when the width of doors, halls, corridors, and stairs, and the number of them, private as well as public, shall be determined by a factor of safety proportionate to its seating capacity or the maximum number of occupants that a building is to contain.

A few suggestions, when upon the subject as to the proper location of stairs, how built, &c., might not be out of place. Certainly no stair should be put up unless sufficiently strong to support any kind of a reasonable stationary or moving load. It should be absolutely fireproof—steps, supports, railings, walls, doors, floors, and roofs. There must be frequent landings or rests. No winding steps. The flights in each storey should be continuous, one over the other, or following each other, each flight to increase in width as they approach the ground floor, and to be well ventilated and lighted. The safest stairway is not that which is placed in the interior of a building, subject to danger by fire in halls, passages, and partitions which are not fireproof. Even though the stairway itself and its parts be invulnerable to fire, the great danger would be from smoke suffocation. If the entire building were non-combustible, this objection might not avail. No stairway is so entirely independent of surroundings as when fireproof and placed on the outside of a building, and no stairway is so near perfection, as far as safety is concerned, as the straight, short flight or receding one, with well located landings, continuous from first to top storey, and so exempt from turns or returns that no such hindrances could interpose or obstruct a straight-ahead exit from top to bottom. Sir John Soane claimed this direct or "avenue" stair as his favourite one for public buildings. It is said that he did really construct some elegant edifices after this plan. A ball, rolled down from the uppermost storey upon such a stair, would not stop until it had reached the ground.

Following the example set us by the most cunning of animals, there should be in every building and habitation a way to get out entirely separate from the one to get in. There is no questioning the right of way out of a burning building. Every one tries to save himself. "Self protection is the first law of nature." The fewer impediments, the quicker out of danger. Palladio argues "that a staircase should be at the entrance of a building, and the first thing to be seen." While this is good advice, it does not always admit of good architectural treatment. The leading idea in every staircase, as advocated by Walton in his treatise on stair building, "should be easy ascent, and the straight line broken by a proper number of stages in the most direct movement of the body." Winding stairs or steps, as a rule, are an abomination, and if the statistics of the loss of lives and injury caused by them could be arrived at, it would be seen that many more accidents happened thereby, after buildings were tenanted, than ever occurred during the dangers and hazard of construction. *Æsthetically*, a winding or elliptical staircase, describing its curves of grace, is pleasing to the eye. But is it beauty when we know how difficult it is of construction? The steps of winding stairs are not parallel—one end too wide, the other too narrow, leaving but a space in the centre or run of the steps, as the only suitable place for ascending or descending. With such uncertain footing they are manifestly objectionable, and were it not for a railing to guide, would not with perfect confidence be tolerated. The only real advantage derived from the use of winders in stairs is economy of space. The landing stair, on the contrary, with its short flights or easy stages in mounting, square and spacious and in perfect repose, conveys in its "make up" precisely what it is—a simple, substantial, appropriate piece of work, commending itself to practical common sense. In our climate, where we have such intense extremes of heat and cold to contend with, in the construction of continuous flights of stairs, especially in our dwellings, schools, and similar buildings, it would be advisable, wherever practical, to enclose each flight or story in separate compartments, as it were, not only to cut off the progress of fire or smoke, but to prevent the great waste of heat which naturally rises to the highest point at the cost of comfort to the lowest.

Our public halls and theatres, tenements and flats everywhere, are for the most part a lamentable attestation that steps and stairs are too few, remote, and inefficient when danger is imminent. The quiet amusement afforded by the seating of an audience

disarms us of the apprehensions we feel upon entering a building badly arranged for sudden exit, and it is only when everybody attempts to leave at once that we, finding how difficult it is to, snail-like, make way through the dense and helpless crowd, can truly appreciate the horror a cry of fire would produce. To get you in is the showman's business; to get yourselves out is your own business. The horrible holocausts which have from time to time occurred, even in our own memory, have served but little to improve the old style of entrances and exits, and insure greater protection to human life. Does a theatre, or hall, or hotel, burn up and wipe out of existence scores of people, the newspapers preach the sad lesson while the funerals are taking place. The agony, after a while, is supplanted by the next or some other dire calamity. The building in the meantime is rebuilt, but practically the same as before, excepting that a few more doors may have been made to open outwardly, a fire-escape added, several fire-extinguishers arranged in conspicuous places, and, perhaps, some lengths of hose purchased; but in all likelihood these will be found, when required, about as serviceable as lifeboats at sea—of no use when most needed.

Probably the most dangerous combination that exists, and one which should in all cases be avoided, are elevator stairs, as it were, enclosing and winding around the elevator from basement to roof, forming an immense chute or shaft, which, in the event of fire occurring at no great distance from it on any storey, would resolve itself into a huge flue to suck up with tremendous power, through its burning crater, every vestige of combustible material below.

And, again, as to the practical utility of the outside iron fire-escapes. Nine out of ten would intimidate the ordinarily resolute man in an attempt to descend them, to say nothing about expecting a delicate, frightened woman, in the midst of a fire excitement, to find her way down to terra firma on them. With a safeguard of some kind (composed say of iron netting) over them, to prevent the escaping occupant from the possibility of falling, greater beneficial results would follow. They should be made more like stairs, well fortified with railings, and their adoption and quantity made compulsory. The horrors of jumping from burning windows would then be avoided by repetitions, at every storey, of iron balconies, and numerous covered stairs connecting them. Build fire-proof and thereby reduce the risks and dangers of fires. A single life saved is worth a world of selfish gain. It is much better that we let splendour and æstheticism remain in abeyance until the appeal of humanity is answered, and life no longer jeopardised. Give us laws which will compel the accomplishment of these suggestions, and such heart-rending, sickening recitals as that of the swallowing up of a whole family by smoke and flames, as occurred in the Stanton Street fire, New York, recently, will cease. The tenement death-traps, which are such a stultifying commentary on our civilisation, laws, and Christian nature, should not be tolerated. Every city, town, and village should hold it as its highest privilege to have every church, hall, theatre, school-house, mill, factory, and tenement house generously and amply provided with every means for instant escape therefrom. Perhaps, in addition, we might add, and justly too, that all places for the above purposes, should be located on the ground-floor. Were this the rule, the dread of attending public places would be greatly lessened, and the poor tenant with his little family in his tinder-box habitation would feel safer and happier. For humanity's sake, then, may we not fondly hope for equal recognition with the lower and more valuable animals, and live to see the time when societies for the prevention of cruelty to humanity will be just as popular as those for the prevention of cruelty to animals.

Municipal commissions for the examination of buildings, and coroner's juries, are inefficient and uncertain, and it would seem that righteous sentiment, outraged by the total indifference shown to the constantly occurring warnings, must sooner or later become aroused, and remodel or obliterate in our buildings all vestiges of such glaring causes for alarm; instituting, as we before ventured to suggest, some practical factor of safety which the present or modern character of our houses necessitate, and which will entirely revolutionise old theories and establish a rule that would prove infallible throughout the land. When that sensible time arrives, and this danger is, as far as possible, avoided, we feel humbly certain that such simple subjects as "Steps and Stairs" will be found invested with the importance they so justly deserve, and the influence and power they may exert in the construction of buildings will be universally paramount and peremptory: second to none.

#### ENGLISH EXCAVATIONS IN EGYPT.

THE excavations which are in progress at Sān or Zoan in Egypt at the cost of the Egypt Exploration Fund give employment to a large number of native labourers, under the direction of Mr. W. Flinders Petrie. According to a writer in the *Times*, some ten or twelve shafts have been sunk at different points, and about thirty-five huge trenches, varying from 7 feet to 24 feet in depth and from 50 feet to 400 feet in length, now radiate

from all parts of the central area. This wholesale ploughing has brought to light successive strata of foundations, pavements, and superstructures of all periods, so laying bare the progressive history of the great temple, and showing how it finally became filled up and buried. The last process was the work of centuries. There were, it seems, two outer enclosures, the earliest being of very remote antiquity, and the latest dating from the reign of Piseb-khanu, of the twenty-first dynasty. Piseb-khanu's wall is of incredible strength. It extended round three sides of the building, and it is yet standing to a height of about 20 feet. It is 80 feet thick, and built of colossal bricks about eight times the size and weight of our modern bricks. Of these, according to Mr. Petrie's calculation, the wall cannot have contained fewer than three or four millions. In process of time (perhaps during the Persian period) houses were built up against this wall. These would in all likelihood be the houses of priests or temple servants. Later on, in Alexander's time, houses began to be built against the side of the north gate. Later still, under the Ptolemies, the wall was considerably cut about and houses were built on it. Finally, during the Roman period (*circa* A.D. 300), the washings of the wall filled the temple itself with mud to a depth of over 6 feet, burying the ruins of the fallen portico, the hypostyle hall, and all the fore part of the building. Some of the beautiful red granite obelisks, however, to judge by the deeper deposit upon which they lie, must have remained erect till about A.D. 1000. This is no fanciful sketch. Mr. Petrie has unearthed these ruined houses, and their chronology is determined by the coins and pottery found in them.

A curious interest attaches to the excavation of private dwellings. Inscriptions and statues are more historically precious; but the pathetic relics of what was once a home affect us more nearly than the monuments of priests and princes. Among those built on the top of Piseb-khanu's wall, an artist's house has been discovered, and adjoining the house a block of workshops. Some Ptolemaic coins, and a jar made by a Greek potter, with "ΜΟΥΣΑΙΟ. . . ." stamped upon its broken handle, date the house and its occupant. It may be inferred that the old artist was engaged on the decorations of the temple. Himself long passed away, he has left his sketch-book and indiarubber behind him; his sketch-book being a thin slab or designing tablet of fine limestone, and his indiarubber a lump of "block emery." The tablet is ruled in squares, its surface much degraded by frequent rubbing, and the corners quite rounded from perpetual wear. His rubbing-stone has also been found, and among the *debris* of the workshops several pieces of waste stone, also ruled in squares, have turned up. Another block of workshops on the opposite side of the temple appears to have been occupied by jewellers and metallurgists, whose chippings of lapis-lazuli, obsidian, carnelian, and other choice stones, besides a great quantity of copper "droppings" and copper slag remain to tell the tale. Most interesting of all these parasitic buildings, however, is a very old pre-Ptolemaic house, partly destroyed in ancient times by fire, and situate on the top of the great wall east of the temple. Discovered more than a month ago, this house has from time to time continued ever since to yield fresh finds. The objects are curiously miscellaneous, consisting of funereal statuettes, bronze deities, and all kinds of amulets, pottery of many periods, jars, cups, plates, saucers, amphoræ, toilet vases in alabaster, bronze vessels, a bronze armlet, a quantity of iron staples, six massive bronze ferrules, belonging apparently to the legs of a couch or table; and, more uncommon than all the rest, a number of rusty iron knives of the time of the twenty-sixth dynasty. The most precious relic of all is, however, a charred wooden case, filled with rolls of burnt papyri. Though these rolls are blackened, broken, and brittle, the demotic writing is yet legible on some; and one little papyrus is quite unharmed and perfect, strings and all. Another seems to be blank, and the box, which may have belonged to a copyist, also contains a bundle of *calami*. A large heap of burnt garments of different textures, the carbonised threads still holding together with sufficient strength to bear removal, was found near the box. The house and its contents are altogether somewhat mysterious. It may have been a den of thieves and tomb-breakers, who here divided their spoils and burnt what they did not care to keep. Discoveries of this kind stimulate the interest with which an archaeologist looks forward to the exploration of the more ancient outlying quarters of the original city. An Egyptian Pompeii underlies those soddened mounds, and it is tantalising to reflect that by the time they are dry enough to be worked the season during which excavation is practicable will already be drawing to a close.

In the temple area, and among the ruins of the great pylon, Mr. Petrie is now systematically examining every side of every fallen block; copying every inscription, however fragmentary, and separately photographing every object of interest. Some of these blocks have actually been worked three times, and bear portions of inscriptions of Rameses II., of Her-Hor, and of Sheshonk, the Shishak of the Bible. Among historical records of various epochs may be noted a curious tablet erected by a negro prince of the obscure period of the thirteenth dynasty, and the discovery of several fragments of a superb granite colossus of Rameses II., originally 50 feet in height, which has been barbarously cut up into building blocks by Osorkon II.

## NOTES AND COMMENTS.

THE programme of the Conference of Architects, which begins on May 5, is hardly sufficiently attractive to tempt visitors to come a long distance in the present weather. But the subjects mentioned are of a useful kind. There are to be six meetings. The first will be the annual meeting of the Institute. At the second the subject set down for consideration is "The duties, obligations, and mutual relations of architect and contractor, with reference to English and foreign practice." The third conference will consider "the tenure of land for building purposes." The "works of STREET, BURGESS, and VIOLETT-LE-DUC" will be discussed at the fourth meeting. For the fifth the subject is, "the French *diplôme d'architecte* and the German system of education." And at the last meeting a paper will be read on "English Architecture Thirty Years Hence." There will be visits to the Architectural Museum, the workshops of Messrs. CUBITT & Co., and to buildings, and a *conversazione* at the South Kensington Museum. A meeting of Associates will also be held.

THE Council of the National Smoke Abatement Institution some time ago protested against the leniency with which fines were inflicted in the metropolitan police-courts upon offenders who do not adopt the best practicable means for counteracting or preventing the smoke nuisance. According to the Act, a sum of not less than 40s. should be paid for the first offence, on a second conviction 10*l.*, and for each subsequent conviction the sum of double the amount of the penalty imposed for the preceding conviction. While this is the law, it is alleged that in some of the police-courts merely nominal fines, varying from half-a-crown to 10s., have been inflicted. The reply of the Home Secretary, to whom the protest had been addressed, was to send a copy of a return of fines inflicted under the Act in London between 1877 and 1881. In that period proceedings have been taken for improper construction in 607 cases, and convictions were obtained in 600. There were also 436 convictions for negligent use. In a very few cases fines of 20*l.* have been inflicted, but the average amount of fines for first offences is only 7*s.* 11*d.*, and for second and subsequent offences 10*s.* 1*d.* The figures show that the charges of the Institution have been well founded.

THE Ecclesiastical Commissioners are obliged to own that their funds are still seriously affected by the continuance of agricultural depression, and by the reduction of tithe averages. During the past year the grants towards the building of churches have not been liberal. Chancel repairs are debited with 7,783*l.* 19*s.* 11*d.*, the restoration of Southwell Collegiate Church with 2,307*l.*, and the residence houses for the minor canons of St. Paul's with 499*l.* 19*s.* 11*d.* But farm and other buildings required an outlay of 38,313*l.* The outlay on construction may be estimated from the architect's charges, which amount to 2,847*l.* 7*s.* 6*d.* The surveyor's charges have been 13,190*l.* 13*s.* During the year thirteen new churches have been substituted for old or existing parish churches, and nine churches have been formally approved for new parishes.

THE earthquake which was felt in Essex and in London on Tuesday recalls one in the last century which was described by HORACE WALPOLE. It is fortunate that in both cases the effects were not serious. In Essex there was naturally much consternation, although the damage that arose in some parts is trifling. In one house near Colchester the old china that stood on shelves was not disturbed, but in other places there was more evidence of the force of the earth tremor. In the village of Wyvenhoe the cottages have been unroofed and the church has been injured. At Colchester the spire of the Congregational Church was partly destroyed, and the old church of Langenhoe has been wrecked by the fall of the spire. According to an estimate which is likely to be exaggerated the damage in Colchester alone exceeds 10,000*l.* In a calamity of this kind science is powerless. It is impossible to foretell with precision when or where subterranean forces are likely to act upon the surface of the earth. For the same reason it is difficult to provide for contingencies by special construction. Houses which were supposed to be earthquake-proof have been tried in California and in Japan—but their success has not been encouraging.

The long delay in publishing papers read at the Institute of Architects has not been satisfactory to the writers. A new arrangement has been made, by which the papers read at the meetings between November and February are able to appear in type in April. The part just issued contains the papers on "Buildings for Applied Science Instruction," by Mr. ROBINS; "On English Monuments of the Sixteenth and Seventeenth Centuries," by Mr. TARVER; "On the Action of Lightning Strokes," by Colonel PARNELL; and "On the Education and Position of French Architects," by the secretary. The theory of Colonel PARNELL was not adopted by the scientists who heard his paper, but there will be less difference of opinion about the remaining contributions. The plans and descriptions of laboratories given by Mr. ROBINS will be found suggestive in practice. Mr. TARVER gives an interesting sketch of some interesting examples of English art, while Mr. WHITE follows Mr. MATTHEW ARNOLD in glorifying the French Academy. If English writers feel the disadvantage of the absence of a standard authority, it is no less true that English architecture also suffers both directly and indirectly from the same cause. In this country we are deprived of the "polite consideration, the charm of manner with which men of science and letters in France treat the subject of architecture." If Lord BEACONSFIELD lived in Paris he would have been restrained from offering the brutal suggestion of the hanging of an architect as the best means to ensure good building, and from foisting another man's *éloge* on the public as a specimen of his spontaneous eloquence.

THE process by which the beautiful lacquer of Japan is produced is not likely to remain much longer a mystery. The lacquer has been subjected to chemical analysis, and its constituents have been determined. The raw lacquer juice now used is really an emulsion containing a peculiar acid, to which the name urushic acid is given, the term having been derived from *urushi*, which is Japanese for lacquer. It is understood that the difference between good and bad lacquer consists mainly in the relative quantities of the acid and water which are present, inferior lacquer having more water than and less acid than the superior kind. One result of the chemical analysis will be to give more certainty to the process with the Japanese, and another will be a diminution of lacquer poisoning, which is supposed to arise from the gradual disappearance of the acid. It is believed that the materials now employed differ from those which were in use when the best examples of lacquer were produced.

A DISCOVERY of great artistic and archaeological importance has just been made while excavating a cellar on the property of the Frères Maristes at Saint-Paul-Trois-Châteaux, a village in the Department of the Drôme. At a depth of only about five feet, the workmen laid bare a room dating from the Roman epoch, still in a very perfect state of preservation. The greatest treasure here found is a superb mosaic measuring 6 mètres 55 centimètres in length by 3 mètres 40 centimètres in breadth (about 22 feet by 11 feet 4 inches), the centre of which is taken up by a scene representing the marriage of HERCULES with HEBE, the goddess of youth. The hero is holding his club in the left hand, and stretching out the right, above the altar, to the goddess, who is clothed in a voluminous floating veil. The expression of the faces in this composition, which is surrounded by an ornamental scroll, is said to be wonderfully good. The rest of the pavement of the room is also richly ornamented; while the thresholds of the two doors consist of coloured mosaics.

Two Roman vases of fine form have been discovered by workmen while constructing a drain in Hyde Close, Winchester. The first is 4½ inches high, and its diameter 3 inches where it commences to decrease towards the neck. The second vase is larger, being 7 inches high and 5 inches in diameter in its greatest circumference. It sustained a slight injury from the pick, but it can easily be mended. It is of a light red colour, except at the neck and handles. These parts are stained a dark red colour, and the decoration of the body of the vase is in a light, almost white, clay, put on in slips and raised. It consists of two alternate groups of four vertical lines and eight pointed stars. The vase tapers to a small and elegant neck, with a small orifice and a pair of small corrugated handles, and the vessel would perhaps hold upwards of a pint. The swell of the vase is ornamented with handsome mouldings.

## ILLUSTRATIONS.

THE BIRMINGHAM LIBERAL CLUB.

WE publish a view of the new club house now being erected by the Birmingham Liberal Club Buildings Company on an important site at the corner of Edmund Street and Congreve Street.

The buildings, which are in course of erection, will extend in Edmund Street only to the fourth bay, but when completed will immediately adjoin the Mason College, as shown by the illustration, and will be in close proximity to the town hall, council house, art gallery, free library, and Midland Institute. The principal entrance to the club is in Congreve Street, from which a vestibule leads to a large hall which, from its size and arrangement, the nature of the materials used, and its elaborate details, is expected to be an effective and original feature of the building. On this floor will be the reading-room, rooms for waiting, telephone and serving, &c., rooms. From the hall an oak staircase ascends to the first, second, and third floors. On the first will be the large dining saloon, bar, luncheon, and private dining-rooms and serving-room. A mezzanine floor will intervene between a part of the first and second floors, and will be occupied by manager's apartments and offices. The second floor will comprise large smoke and billiard-rooms with lavatories, and a large private dining-room. The third floor will be entirely set apart for bedrooms, bath and dressing-rooms for the members. The fourth floor will be entirely occupied by an unusually large and complete kitchen department; the bedrooms for the female servants will be over this. On the basement floor are a large, well-lighted lavatory for members and the bedrooms for men servants. A large hydraulic passenger lift will afford access between basement and third floor, and there will be provided dinner and other lifts. The heating of the building will be by a high-pressure small pipe water apparatus, and the ventilation will be effected by flues traversing the walls and communicating with a large foul-air chamber in the roof, from which a large shaft, heated with hot water and gas, will withdraw the foul air. It is proposed to use the electric light in all but the less important rooms.

The wall facings are of red bricks from Kingswinford, with red terra-cotta details from the works of Mr. J. C. EDWARDS, Ruabon; the granite is from the quarries of Messrs. WRIGHT & SON, Aberdeen. The builders are Messrs. W. & J. WEBB, of Birmingham; Mr. SIBLEY is the clerk of works, and the building is being erected from the designs and under the personal supervision of the architect, Mr. JETHRO A. COSSINS, Corporation Street, Birmingham.

SCHOOL AND TEACHER'S HOUSE, ULLENHALL.

THE village of Ullenhall is situate in the heart of that portion of Warwickshire known as the Forest of Arden. The school is for the accommodation of eighty children, and has been built, together with the teacher's house attached, and is maintained, at the cost of Mr. T. H. G. NEWTON, of Barrells Park, near Henley-in-Arden. The works have been carried out in the most substantial manner, at a cost of slightly under 5% per school-place provided, by Messrs. T. COLLINS & Co., of Tewkesbury, under the supervision of the architect, Mr. W. HAWLEY LLOYD, of 79 Colmore Row, Birmingham.

HOUSES, KING'S NORTON.

THIS illustration represents a pair of semi-detached houses in course of erection at King's Norton, Worcestershire, for Mr. W. B. FEATHERSTONE. Each house contains three reception-rooms, four bedrooms, and two attics, with the usual accessories. The exterior will be faced with best pressed red bricks, and relieved with ornamental moulded brickwork. The stone dressings will be Horsley Castle stone, and the roofs will be covered with brown tiles. The architect is Mr. OLIVER ESSEX, A.R.I.B.A., of 35 Paradise Street, Birmingham.

DESIGN FOR BOARD SCHOOL, MILITARY ROAD, NORTHAMPTON.

THIS design was submitted in the late competition under the motto "Straightforward." The plan was arranged to accommodate 350 boys, 300 girls, and 500 infants, the smallest classrooms being for 60, and the largest 68 or 70 pupils. The floor space allowed was 9 feet per child in the

infants' school, and 10 feet in the others. The least width of the schoolrooms is 22 feet, and of the classrooms 20 feet. The height to wall-plates is 16 feet, and to ceiling at collar of roof 25 feet, and to the infant school, which is lofty, so as to get the full advantage of the window light in gables over galleries, 27 feet.

It was proposed to construct the walls of best pressed red brick, with red stone or terra-cotta dressings, and the floors of solid wood blocks on concrete. ELLISON'S patent inlet bricks and BOYLE'S outlets for extracting vitiated air would be used. The cost of the building, according to builders' estimates, would not exceed 9,290*l.* The design is by Mr. WILLIAM DOUBLEDAY, architect, Birmingham.

## THE ARCHITECTURAL ASSOCIATION.

THE members of the Architectural Association held their annual soirée on Friday evening, the 18th inst., at the Westminster Town Hall. A large gathering of members assembled for the occasion, including many past presidents and senior members. The capacity for hard work is a well-known characteristic of the Association, which, as an educational organisation, is something altogether unique not in the kingdom alone, but, it may be said, in the world. That those who apply themselves in earnest to work and study are among the foremost to know how to enjoy themselves in season need scarcely be observed. Nor is it surprising that, with so good a programme as was provided, a pleasant evening was spent by all, although the hall itself is a gloomy one. The proceedings of the evening were inaugurated with preliminary business, as is usual at the ordinary meetings, Mr. Cole A. Adams, the president, occupying the chair, and supported by the honorary secretaries, Mr. Atkin Berry and Mr. H. D. Appleton. This routine business was humorously adapted for the occasion, and not to be taken *au grand sérieux*. The minutes having been read, certain eminent members of the profession and notabilities outside the profession were nominated for election as members of the Association. Sir Edmund Beckett, for instance, was nominated for membership on occasion of the completion of the west front of St. Albans. Mr. Seddon and Mr. E. W. Godwin, proposed by Mr. Aston Webb and seconded by Mr. Ingress Bell, were nominated on occasion of their letters to the *Times*. This business was duly transacted, and served as the introduction of the chief item of the evening's entertainment, in the shape of a burlesque, composed within the ranks of the Association, the authors of the play being, so the programme stated, unknown, and wishing "to remain so." The characters were admirably sustained by various members, and the scenery was certainly "kept strictly subservient to the acting," for—well, there was none. The play of course turned on matters architectural in general, and on competitions, notably the Admiralty and War Office competitions, in particular. The architectural world is fairly well acquainted with the vagaries attendant on competitions, so the present competition seasonably suggested the occasion for illustrating the chances of mischances run by competitors in these professional games of hazard. Without giving any description of the course of the play, a word by way of sketching one of its leading ideas may be allowed. Mactout, a London architect; Mrs. Mactout, his amiable consort; and Bunkum, an American architect, "great at competitions," were the prominent characters; as also three Witches, or Friends in Council. Mactout is a would-be competitor in the Admiralty competition, though it does not appear as if he had put pencil to paper, far less got plans ready. He evidently entertained the gravest doubts as to his powers of winning a place in the contest, and, if anything, appeared pretty confident that his chances were *nil*, should no lucky chapter of accidents come to his aid. The aid comes, of course, for while strolling on Hampstead Heath, engaged in building villas, detached and semi-detached—*en Espagne*—the three witches appear on the scene, and in an evil—good or evil?—hour Mactout crosses their palms with small silver coin of the realm, and learns in return that Bunkum has just arrived on the Heath from New York, with plans under his arm destined to carry off the competition. Mactout's resolve is instantaneous, and he carries off the winner, that is to say, the predicted winner, plans and all, to his own house, there to give him hospitality for the night. The evening's entertainment, however, proved rather too strong for Bunkum's head, or perhaps his long journey had tired him, for, to say the least of it, Bunkum got so sleepy after dinner that he fell on his back, fortunately on a chair or two, with his feet pointing heavenwards, and his legs at right angles with his body, after the supposed most orthodox American fashion, and straightway went off in a profound stupor. While thus sleeping the sleep of the just, Bunkum is carried off to bed by Mr. and Mrs. Mactout—not, however, before they had subtracted the coveted plans from under his arm, where hitherto they had been jealously guarded by Bunkum. The motto on the plans is speedily erased, and that of Mactout substituted, and the

plans sent off instantly to the St. Stephen's Porch at the Houses of Parliament. The time, the study, the labour expended by Mactout to win the competition had unluckily been expended in vain, on account of the small oversight that, having changed the motto on the plans, he had forgotten to change the letter accompanying the plans which Bunkum had written. Bunkum of course is victorious: he wins the competition, but is so thoroughly alarmed by Mactout, who threatens to write a letter to the *Times* to say that he is utterly incompetent to carry out so large an undertaking and is quite unpractised in construction, &c., that he makes Mactout his friend by consenting to go halves with him. Among other incidents which were represented in the course of the play, the styles, Egyptian, Greek, Roman, Moorish, Italian, Gothic, and Queen Anne, were personated by seven gentlemen, and, when properly grouped together, did duty for the style of the future, illustrative, no doubt, of "a wise eclecticism resulting in the survival of the fittest." At the conclusion of the burlesque an old friend of the Association made his way to the stage, not unlike a district surveyor about to condemn the amalgamated styles as an unsound structure, but instead of this he advised the audience to take the opportunity and study it, that is, if they thought that it represented the architecture of the future. This was by the way only, and he asked the audience to bestow a hearty vote of thanks on the members who had so successfully catered for their amusement that evening, and the vote was carried by acclamation.

### ART IN SCHOOLS.

THE prizes gained by the students of the Stoke and Fenton School of Art were distributed on Saturday last by Mr. Oscar Wilde, who, in his address, said that they were told by Mr. Ruskin that we lived in an ugly age, and that art suffered from smoky chimneys, polluted streams, railways, and commerce; but he (Mr. Wilde) entirely disagreed with him. The true artist did not wait until life became picturesque for others. He took care to see life under picturesque conditions always. He would not desire that external life should be permanently beautiful, and he would know that under certain conditions of light and shade everything would look beautiful. Once in every twenty-four hours everything became beautiful. Mr. Ruskin had said many dreadful things about the iniquity of smoke, and he (the speaker) was not going to praise it on sanitary grounds. He would only remind them of the beauty Turner saw in those very scenes which Mr. Ruskin so often ran down. There was no better answer to those who complained of commerce spoiling art than to turn to Turner's pictures. He referred to the liking for prettiness prevalent among many modern artists, and after speaking of the extremely hard outline of modern English painting, in which we might learn something from the Japanese, and describing the way in which Japanese children were taught to draw, he said all the world was the property of the artist, and under certain conditions would give him beautiful subjects; and it was to the visible world he should go, and not to literature. We had suffered for the fatal alliance of painting with poetry. We had seen painters pass their lives in illustrating poetry and history, becoming merely adjuncts of literary men. There was plenty of scope for the artist without having recourse to literature for his subjects. He considered it would be better to teach children handicrafts instead of mere book learning in our elementary schools. They could never forget the dreary, weary hours they passed in childhood with their books—books good enough in their way, but not good enough in our way. They learned a good deal at school, and a great deal more in the open air. Instead of teaching the latitude and longitude of countries no one wanted to go to—which was what people called geography; or the lives of kings of the Saxon Heptarchy, which was merely the lives of people who never lived at all, they should teach children handicrafts, which would enable them to apply the arts of decoration to their homes, and make them pleasanter places to live in. Every child had a sense of imagination and creation about him that our modern books hardly seemed to touch at all. We ought to make our schools far livelier than they were. The school should be one of the most beautiful places in every town and village—so beautiful that the punishment for an idle little fellow should be keeping him away from school. What was wanted was a constant succession of beautiful things in the school, so that the children should grow up with lively surroundings, and grow to like the beautiful and good. The moment the nation ceased to honour handicraft the end would come to all idea of beauty in its productions, and those who were anxious to bring up their sons as clerks or members of the liberal professions should remember that handicraft was really a noble and splendid profession.

Mr. Woodall, M.P., in proposing a vote of thanks to Mr. Wilde, said if he might presume to take exception to anything in the address they had just heard, it would be to the doctrine laid down that there should be no connection between painting and poetry. He recalled the lines of one who must have been singularly devoid of poetry, who wrote, "A primrose by the river's brim, a yellow primrose was to him, and it was nothing more." Whether they regarded the primrose as the symbol of the æsthetic school with

which Mr. Wilde had been identified, or as the emblem of a great political party, their meeting that day was much brighter for the many primroses they had the pleasure of seeing in that room. Mr. Wilde had referred very forcibly to the duty of making life—especially in relation to their poorer children—beautiful, and he trusted that, although Mr. Wilde might be regarded as the apostle of an idealistic school, practical people would not fail, as far as in them lay, to carry out his injunction. A society had been formed to accomplish this purpose by means of pictures and other works of art, and they were much indebted to Mr. Wilde for having so authoritatively enforced the duty and advantage of making our elementary schools more attractive and practical. He (Mr. Woodall) had had opportunities during the last few years of seeing a good deal of elementary school work in various countries, and there was nothing so impressive as the tendency of foreign Governments to teach children practical handicrafts, and to familiarise them with the use of tools—in many cases going far beyond that. It was satisfactory that the experiment had been put in operation by several School Boards in this country with a success which was particularly gratifying.

### STRATFORD-ON-AVON CHURCH.

THE Society for the Preservation of Ancient Buildings have so often remonstrated with foreigners about projected restorations and alterations of buildings, it is not surprising to find a Frenchman protesting against the works which are proposed to be carried out in the parish church of Stratford-on-Avon. M. Jusserand is an admirer of Shakespeare; and he is, moreover, one of the vice-presidents of the New Shakespeare Society. He has, therefore, some claim to attention. M. Jusserand says that it was with much surprise he heard, during a recent visit, of the restoration; and from the accounts he received, he believes that what is contemplated is one of those thorough works of which there are too many examples on the Continent and in England. According to M. Jusserand, the vicar considers that the church is at present too small, and a more capacious nave is required for the development of the ceremonies; but there must be some error in the statement, and it is possible the critic is thinking of foreign ritual, and of what he has seen in French churches. The Stratford-on-Avon church, says M. Jusserand, has, in addition to its associations, an artistic value that is real. It is a very good specimen of the churches which were found in small towns in the fourteenth and fifteenth centuries. As so many of them have been destroyed or restored, the survivors are the more deserving of respect. The monuments which are to be seen on the walls of the church, and which record the names of numbers of the inhabitants of the town, appear precious in the eyes of M. Jusserand. Through them the church becomes the Westminster Abbey of Stratford-on-Avon, and he recalls the fact that Shakespeare selected by preference the provincial temple as the place where he might repose in the midst of his kindred, and without more pride, pomp, or circumstance than was befitting a wealthy burgess who was the owner of New Place. If the poet could revisit the glimpses of the moon, he would still find something familiar in the appearance of the church. The number of the monuments has increased, but they are inscribed with the names of townsmen, and it may be assumed that Shakespeare would plead for their preservation. At present the memorials are doomed to removal, as new walls are to be constructed on new foundations. M. Jusserand is of opinion that the fabric of the church is in good condition, and will so remain provided that some care is taken for its maintenance, and that the upper part is kept free from moss and creeping plants.

### ELY CATHEDRAL.

THE Commissioners who were appointed to inquire into the condition of the cathedral churches of England and Wales have reported on Ely Cathedral. This cathedral is on what is called the new foundation, having been constituted by King Henry VIII. in 1541 on the dissolution of the ancient Benedictine monastery founded by Queen Etheldreda A.D. 673. But a bishopric was created at Ely in 1108, the monastery being preserved, and the bishop being also the abbot. It is calculated that the gross income of the Dean and Chapter of Ely is 14,653*l.*, and the net income about 13,200*l.* The treasurer, however, says the net income is under 13,000*l.* Out of that sum, 7,440*l.* is paid to the dean and canons, and 3,098*l.* to precentors, lay clerks, &c. In addition, 900*l.* goes for subscriptions, allowance to curates, donations, &c. What is left amounts to 2,000*l.*, and is expended in the following way:—Maintenance of cathedral worship and repairs, 1,250*l.*; maintenance of precincts, labour, insurance, &c., 550*l.*; and maintenance of houses for cathedral officers, 200*l.* The sum expended on the fabric of the cathedral is plainly of small amount. The dean and canons have their several residentiary houses within the precincts; so have also the master of the schools, two of the minor canons, the teacher of the choristers, and the vergers. The dean

and canons keep their own houses in repair, with some aid from their corporate funds, as appointed by statute. The houses of the minor canons and other officials are repaired wholly by the chapter. The maintenance of the master's house and dormitories, together with the schoolrooms, which are situate in the great gate-tower of the college, comes from the school endowment fund. An ancient chapel within the precincts, recently restored, is lent for the purposes of the school, but kept up by the chapter. There is also a muniment-room, fireproof, and two cottages for the use of the college retainers, and an ancient store-barn of large dimensions which has been converted into stables for the use of the chapter. The condition of longer residence now required of the dean and canons have necessitated considerable expenditure of late years in the improvement and enlargement of several of the houses. Four of the present canons have found it necessary to obtain loans from Queen Anne's Bounty by a mortgage on the income of their stalls, to which payments, as regards repairs, the chapter contribute according to the requirements of the statutes. The chapter-house of the monastery is said to have been destroyed at the dissolution. The chapter of the college used formerly to meet in one of the vestries, but for many years past they have made use of the dining-room and other apartments of the deanery for capitular purposes, and furnish and repair them out of the common fund. The ancient barn above mentioned might perhaps be made available for public objects connected with the church—if, for instance, it were converted into a chapter-house and library, and used occasionally for diocesan meetings; but the outlay required would be very considerable.

The following is the arrangement proposed by the Commissioners for the conservation of the cathedral and other buildings belonging to the see:—The treasurer, under the advice and direction of the dean, is to provide for the external and internal repairs of the cathedral and of everything appertaining to the church and choir, and of all other houses, buildings, walls, fences, and grounds within the precincts of the cathedral (except those appropriated to the dean and residentiary canons and to the cathedral grammar school); but no order is to be given for any important work without the consent of the dean and chapter. The treasurer is also to take notice of the houses, buildings, and erections appropriated to the dean and residentiary canons, which by direction of the dean and chapter he shall require them severally to insure adequately against fire, and if any repairs of the same shall be required, and if being warned thereof by the treasurer, the person liable to the repair thereof shall not repair the same, the treasurer is to provide for the repair, and charge the same to the person liable; or in regard to the house and buildings appropriated to the treasurer himself, if being warned by the dean he shall not repair them, the dean shall order the repair and charge the same to the treasurer, provided that the dean and residentiary canons shall, as allowed by the ancient statutes, be assisted with the requisite materials for such repairs by the treasurer at the common charge, or, if more convenient in his judgment, that one-third of their reasonable expenses be so allowed them.

### THE MUNICIPAL OFFICES, LEEDS.

THE new Municipal Offices and Free Library in Leeds, which have been designed by Mr. Corson, were opened on the 17th inst. by Alderman Woodhouse, mayor. The cost has been over 100,000*l.* The library includes a reading-room, 80 feet long by 40 feet wide, divided into a broad nave and aisles by six arches upon pillars of polished granite. The walls are tiled throughout, and on them are medallion busts of Shakespeare, Homer, Dante, Milton, Goethe, Scott, and others, the work of Mr. B. Creswick. The general character of the design and ornamentation of this room is Romanesque. On the next floor is the lending library, which will contain forty thousand volumes. Here terra-cotta takes the place of granite, the effect being different in character and much more subdued than that of the room below. Above this is the reference library, which will contain a hundred thousand volumes.

At the banquet which followed the opening Alderman Tatham proposed the health of "The architect of the new building," and paid a high tribute to his abilities as an architect.

Mr. Corson, in replying, remarked that if he were to be guided by the adjectives which had been used respecting the new municipal buildings, it would seem that the work had not altogether been a failure. The money spent upon them had been well laid out, and full value had been obtained for the expenditure. He, however, intended to ask the committee to allow him to complete a few things which were scarcely to his taste. For instance, the hot water coils in some of the rooms required to be made something rather more attractive to the eye than they were in themselves. Two statues were also wanted for the front and one for the centre of the building. Possibly some gentleman of artistic proclivities and a large purse would present such for this particular purpose. He was sorry that the late chairman of the committee had not been able to be present at that day's proceedings. He desired to thank those who had assisted him in the work during

the last five years, including Mr. Watson and Mr. Osborne (clerk of works), who filled a similar place in connection with the Manchester Town Hall. A good deal of labour had been necessary, as shown by the fact that 1,060 drawings in connection with the buildings had been prepared.

### THE NEW UNIVERSITY BUILDINGS, EDINBURGH.

THE Principal and Professors of the Medical Faculty invited over six hundred guests to a luncheon in the Anatomical Museum of the University New Buildings.

Dr. Billings, the representative of the University of Philadelphia and of the John Hopkins University, proposed the toast of "The Architect" of the buildings. He said:—I am very glad to have the opportunity of proposing the toast which is set down opposite my name, for I have had the opportunity of examining the buildings which have been constructed for the work of the medical departments of many of the great universities in Europe and of our own schools, and in this country also. The time has long gone by when the single little amphitheatre, such as some of you may remember to have seen in the old University of Bologna, with its two or three professors, was sufficient for the teaching of medicine. We have now learned that, in order to teach men to swim, it is necessary to put them into the water, and the whole tendency of modern education is to provide practical facilities—laboratory facilities. The old amphitheatre, while not done away with, is not now the sole method of instruction. The combination of all the methods for the various branches which are now considered necessary for a medical education—the proper combination of the eight, nine, or ten chairs, with means for theoretical instruction on the one hand, and practical instruction on the other—is not an easy matter even for a small school; but the difficulty may be imagined when it is necessary to provide, as we have heard to-day, for 1,500 students. After a careful examination of this building, I am prepared to say that these difficulties have been largely overcome, and that this is to-day, taking it altogether, the best planned and best arranged medical school of instruction in the world. I think, therefore, I need not use any special arguments or pleas to induce you to drink the toast which I shall propose to the man who has combined with his own skill all the information derived from all the various sources, to arrive at this perfect and harmonious result; for the architect must have exercised great judgment and performed a vast amount of mental work, besides assimilating the information which he has obtained elsewhere. The single scraps of information he may have obtained from the professors would not have created a building such as this, no more than a few isolated facts would create a science. I therefore ask you to join me in drinking to the health of the architect of the buildings, Mr. Rowand Anderson.

Mr. R. Rowand Anderson, who was received with loud applause, said in reply:—I esteem it no small honour to be called upon to acknowledge this toast, as having been selected to be the architect to design and to superintend the erection of the important public building, the inauguration of which is the occasion of this great meeting to-day. And I ought to feel more than gratified with your verdict, and with the graceful acknowledgment of the manner in which I have accomplished my task, which has been pronounced by Dr. Billings, whose distinguished position in the medical profession, as the head of a great department of State, and whose knowledge of all the great buildings of the world of this description entitle him to speak with the voice of authority. To combine in one building the nine great departments of this school of medicine, with all the varied and different requirements, was a task of some difficulty. After studying the requirements of the professors, and after visiting the best buildings of this kind that eight years ago existed in Europe, I realised the great change that was taking place in the teaching of medicine and surgery; and I saw that if the school in Edinburgh was to maintain its position I must produce a building in which the great side of medical teaching—the practical side—could be carried on under the most favourable conditions, and that no mere pedantic rule of architecture or questions of style should so limit me as to mar the vital object of producing a building thoroughly adapted to its purposes. If I have succeeded—if I have even partly succeeded—for all the work of the best of men has those imperfections which are the steps towards that greater degree of perfection to which we are striving to attain—I shall always feel pride and satisfaction that I have been privileged to contribute to the maintenance of the fame of this great school, and to enable it, not only to sustain the traditions of its past history, but to hold the position which it has so nobly won. And when this building is completed by the addition of the great hall, I trust it will be a building not unworthy of our own romantic town. I have been frequently asked why I have adopted that phase of architecture which you see here. Obviously I could not have made use of Greek architecture, and to have adopted Palladian art would

have been to sacrifice the interior to the exterior. I have not adopted Mediaeval art because an architect cannot ignore the spirit and tendency of his time; but I have made use of that phase of art which arose in Italy during the second half of the fifteenth century, when the great minds of that country began to burst the bonds of dogma and ecclesiastical authority, and were determined to inquire into the nature of all things, and which, I believe, will be the meeting ground where those gifts of the ancient to the modern artists—viz., those principles of construction evolved and perfected during the Middle Ages, which so long as we build in stone and lime must be used, and that love of beauty and humanity for its own sake so characteristic of Classic art—will mingle and lead to the production of a phase of art that will respond to and be more impressive of the thought and life of the modern world than anything we have yet seen. To the Professors, to the Building Committee, I owe my most grateful thanks for that confidence they have always placed in me, dealing with all questions—practical or artistic—that have arisen. Of all the contractors that have been engaged in the work, I am bound to say that they have done their duty faithfully; and I have also to acknowledge the services of Mr. Allan Clark, the clerk of works, who has been employed here throughout; and whose knowledge of work, and whose frankness and courtesy have contributed very largely to the realisation of this building. And to this great and illustrious company I return my most grateful acknowledgment of the hearty manner in which they have responded to this toast.

### THE NATIONAL GALLERY.

THE Report of the Director of the National Gallery for 1883 has been published. Mr. Burton informs the Treasury that during the year sixteen pictures have been purchased. Of these, the most important are Mantegna's *Samson and Delilah*, which was bought at the sale of the Blenheim Collection for 2,362*l.* 10*s.*; the *Procession to Calvary*, by Ridolfi del Ghirlandajo, purchased in Florence for 1,200*l.*; a *Portrait of a Young Man*, by Antonello da Messina, which cost in Genoa 1,040*l.*; and a *Portrait of a Boy*, by Isaac van Ostade, for which 840*l.* was paid.

The bequests of the year have been a *Portrait of a Lady*, by Sir Henry Raeburn, R.A.; a *Young Girl carrying a Lamb*, by Jean Baptiste Greuze; a *Family Group*, by William Hogarth; *The August Moon*, by Cecil Lawson, presented by Mrs. Cecil Lawson; *Christ at the Column*, by Velasquez, presented by Sir John Savile Lumley, K.C.B.; and a plaster cast from a bust of Mantegna, by Sperandio, in the Mantegna Chapel, basilica of St. Andrew, at Mantua; lastly, is a palette, formerly belonging to the late J. M. W. Turner, R.A., with an autograph note attached.

In conformity with the provisions of the National Gallery Loan Act of 1883, a certain number of pictures belonging to the British school have been selected for loan to provincial and other institutions. The wall-space thus gained has enabled the Director to place in Room XVI. many recently-acquired examples of the foreign schools, but several still remain hung on screens in other parts of the Gallery. The pictures have been lent to the National Portrait Gallery, the National Gallery of Ireland, the Walker Art Gallery, Liverpool, the Manchester Art Gallery, and to the Corporations of Sheffield, Nottingham, Oldham, Dundee, Leicester, Stockport, Warrington, Stoke-on-Trent, and Glasgow. In addition, about forty oil paintings by Turner have been removed from the walls of the National Gallery, and will be distributed between the several institutions above mentioned as soon as the allotment has been effected. Many of these loan pictures require to be cleaned, and some to be re-lined, before they can be sent away. This will occasion some delay, and involve an expense which cannot be met out of the ordinary annual vote for this department. It is hoped, therefore, that a special provision will be made for this purpose by Her Majesty's Government, as soon as its amount can be ascertained.

The total number of pictures now contained in the public rooms of the Gallery is about 940, exclusive of water-colour drawings. The death of the Duke of Ripalda has delayed for a while the removal of the *Colonna Raphael*, which the Duke, shortly before his decease, had promised to effect. The trustees now only await a formal application, properly authenticated, from the late owner's executors, on receipt of which it will be delivered into their custody.

The glass screens, so long desired for the prevention of draughts in the Gallery, have at length been erected in the entrance hall, to the great advantage of the students and the public, and with a beneficial result to those pictures which, being hung in rooms near the staircase, had previously been exposed to constant variations of temperature. But the evils thus mitigated will not be entirely removed until the present inconveniently planned hall and staircases have been entirely remodelled, an improvement which the trustees are glad to find is included among the alterations proposed for the building by Her Majesty's Office of Works.

Recent additions to the contents of the gallery, acquired by purchase and bequest, have rendered it impossible to postpone any

longer the enlargement of a building in which the available wall-space has long been insufficient for the proper display of many important pictures. Accordingly, in the early part of last Session Her Majesty's Government obtained from Parliament a grant of 5,000*l.*, as a first instalment towards the cost of new rooms to be erected at the rear of the old Gallery, and in extension of the new buildings designed by the late Mr. Edward Barry, R.A. The proposed additions will somewhat encroach on the space hitherto occupied by St. George's Barracks. This has involved negotiations with the War Office, and the Office of Woods and Forests, which have unfortunately delayed the commencement of the works, and up to the present time no portion of the building contract has been undertaken; but it is hoped that after the settlement of necessary preliminaries no time will be lost in carrying out a scheme of such essential importance.

As nearly as can be calculated, the National Gallery was visited by 849,604 persons on the public days during the year 1883, showing a daily average attendance on such days (207 in number) of 4,104. These numbers must, however, be only regarded as approximate, no accurate means of checking them being in use.

On students' days (Thursdays and Fridays), when the number of visitors entering by payment is registered by a turnstile, 36,572 persons were admitted between January 1 and December 31, 1883, the admission fees (at sixpence each) amounting to 914*l.* 6*s.*, as compared with 856*l.* 10*s.* received in 1882.

The total number of students attending the Gallery on Thursdays and Fridays throughout the year 1883 was 21,192. Independently of partial studies, 778 oil-colour copies of pictures have been made, viz., 465 from the works of 70 old masters, and 313 from the works of 43 modern painters. The picture that was most often copied was Greuze's *Girl with an Apple*, and among English works Reynolds's *Infant Samuel*.

### PROTECTION IN THEATRES AGAINST FIRE.\*

THE safety of the public must be studied by the enforcement of certain precautions that are indispensable. To describe these I propose, first, taking the auditorium, and afterwards the stage.

The seats in the auditorium should be fixed, every seat allowing at least two and a half square feet of room for the occupant, and be so arranged as, while tending to prevent a "block," allow a free passage to the exit door. All the seats in a theatre should be licensed, and it should be an act against law for a manager to allow or permit more people in his theatre than he has licensed seats to accommodate. All staircases should be constructed with hand-rails on either side, and where any turn of the passage may lead any one to doubt the direct way out, the word "Exit," with a hand pointing in that direction, should appear prominently. All exit doors should be distinctly labelled "Exit," and every such door should be opened nightly for egress. All exit gangways should be clear of any obstruction, and for outer exit doors, which should open outwards, carpet curtains should be used in place of doors, to prevent draught, &c. Every separate part of the building, such as pit, dress circle, gallery, &c., should have a separate and direct exit, no other exit leading into it at any junction whatever. Excepting the case of private boxes, there should be no movable seats capable of being overturned in any part of the theatre. Cloak rooms, refreshment rooms, and other public conveniences, should be situated at the farthest point from the exit door, thus leaving the exits clear of unnecessary traffic. No greater number of people should be contained in any part of the "house" than, by calculation of width of exit, &c., would allow of a clearance being effected under three minutes. Special attention should be directed to such parts of the house as are highest from the basement. Smoke ascends, and suffocation can be effected by causing insensibility in the space of one minute.

An outlet for smoke in the roof is desirable, although it may assist the spread of fire,† life being of greater value than property. All gas-pipes, &c., should be of iron, no metal piping being used. If the lighting power be by gas, it should be supplied from separate meters and mains, one for the auditorium, the other for the stage; while supplemental means, such as oil lamps, should provide against the contingency of total darkness. Where lighting is effected by means of electricity, the wires should be laid under responsible authority.

Lastly, the adoption of fire regulations and fire drill, as explained, should be enforced, and the building subjected to inspection after being closed, by constituted authority, that would insure proper vigilance being exercised against an outbreak of fire.

The stage, a combination of wood, canvas, arrangements for lighting on an extensive scale, and properties generally of a naturally inflammable character, rendered still more so by the great heat nightly engendered, may be considered the part of the house requiring the greatest protection. The danger attending the

\* From a paper by Captain A. W. C. Shean, Consulting Fire Brigade Engineer, published in the Journal of the Society of Arts.

† Such outlet being made to act automatically by the action of heat.

lighting of a stage, generally effected by the use of coal-gas, must be considered.

The frequent shifting of scenes necessitates a constant rearrangement of gas-pipes having joints of flexible india-rubber, the insecurity of any one of which, causing an escape of gas, being likely to lead to danger of the greatest magnitude. It is most desirable that lights, as much as possible, should be fixed and powerfully reflected—use being made of everything available, floor and backs of scenes—to increase the power of light, which would be advantageous from the point of view of safety from fire as well as economy.

Flexible gas-joints should be under constant supervision, all pipes for the conveyance of gas throughout the "house" being of iron. No workshops of any description or "stores" should be attached to or form part of a theatre. Where scene-painting is done inside a theatre it should be executed under strict rules, provision being made, amongst other important items, against smoking. It is absolutely necessary that every licensed building should be placed under strict rules and regulations, providing for careful, vigilant, and ceaseless watching.

Stage properties generally may be rendered non-combustible by the use of chemicals, such use being approved at the Society of Arts meeting on May 31, 1883, when the following resolution, proposed by Sir Frederick Abel and seconded by myself, was carried unanimously:—

"That it is important that attention should be given by managers of theatres to the known methods for reducing the inflammability of structural or decorative materials, and that it is desirable that more use should be made of such methods."

Practically the recommendation is not appreciated, and little or no use is made of a valuable means of protection easily and inexpensively applied.

Water, and that of a most insufficient and scanty supply, is the only element upon which any reliance can be placed for the extinction of fire in theatres.

The pressure in the Strand district, where many of London theatres are situated together, I tested in February 1882, and found to be under 45 lbs. on the square inch. The pressure varies from 30 lbs. to 50 lbs., the exception being a pressure of 55 lbs. This highest pressure is insufficient to reach to the roofs of many of our theatres, and there is only one remedy. Each theatre should be provided on the stage with a copper tank, containing about 100 gallons of water, with four deliveries, one for each side of the stage—"floor" and "flies." By means of an air-pump, air could be pumped into the cylinder, till, by gauge, a pressure could be shown of at least 150 lbs. on the square inch—and the gauge would continue to show the existence of the pressure or its decrease.

Theatre fires have, in almost every known instance, burnt themselves out. Density of volume or force of contact will alone stop a fire in a theatre, by, so to speak, suffocating it. For this reason I question the utility of a high proscenium wall as a means of stopping or preventing a "burn out" in event of fire. From practical experience I should assert that unless fire in a theatre can be subdued locally, *i.e.*, that an outbreak can be checked within a reasonable limit by local appliances then and there at command, all hope of saving any part of the building might be deemed futile. The delivery of water from such a reservoir and with such pressure as I have named, through branches one-sixteenth of an inch in diameter, would prove an extinguishing agent of sufficient power for all ordinary purposes. Little discretion has been used, in numerous instances, in placing the hydrants and appliances in theatres for fire extinction. Exit gangways and similar places would, in event of fire, be crowded with a surging and excited crowd—and in these places are the appliances, in many instances, fixed. The hose is coiled, the branch and different parts of the gear laid apart "on view," the practical use of the appliances being seemingly ignored. On the occasion of accident, such parts of the appliances for fire extinction have to be joined together, and the hose rolled out, and thus the most valuable time, namely, that immediately following an outbreak of fire, would be wasted in completing work that should be kept perfect, and the appliances ready for instant use.

That part of the house used by the orchestra, if connected direct with the outside of the building by a subway, would be the most convenient for placing hydrants, &c., as the appliances, while being used, would be free from the turmoil of a crowd, and handy for use by the servants of the theatre, whose knowledge of a clear subway to the street would enable the appliances being advantageously worked for as long a time as possible in the direction of any part of the house. Supplementary aid and assistance could also, by means of the subway, gain easy access from outside the building, while the audience would be permitted to avail themselves of the ordinary exits, unencumbered with fire-brigade appliances that, otherwise being got ready and used in their midst, could only tend to add to confusion, loss of time, and in every way prove highly dangerous and thoroughly inconvenient. In the event of fire occurring on the stage of a theatre, it is usual to cut away the burning portion. For additional safety it would be as well to have ready for use "trays" of close wire gauze, that might

catch the material alight, and so tend to prevent an extension of the fire.

Buildings to be erected and intended for theatres or places of public amusement should have all staircases constructed of concrete, with banisters of iron, and have a separate and distinct water service for fire extinction. As danger is as likely to be apprehended from smoke as from fire, special attention should be directed to the gallery and upper parts of the building. At only one theatre, namely, the Savoy, has this been studied in the construction of the theatre, the gradient of the basement being utilised to afford equal advantages to the upper as to the lower parts of the house.

A full and complete official investigation should follow the occurrence of any and every accident by fire in theatres, a report of the occurrence of which should be made compulsory to the duly appointed authority, the establishment of which, by the Government of the country, is a most necessary and pressing subject of home legislation. The entire English press has acknowledged the necessity for some decided action being taken, in the public interest, in the prevention of fires in theatres, and it is to be sincerely hoped the experiences of the past may not need repetition in order to provide reasonable security in the future.

I feel it necessary to draw attention to the manner in which certain theatres are at the present time being constructed. In one instance "the theatre" is contained in an inner shell, the outer shell comprising an hotel, residential chambers, and shops. The combination, though doubtless economical, is dangerous, and such a building should never be licensed for public entertainment. Risk by fire in theatres will ever be sufficiently great, but to add to the risk by enclosing such a building with an hotel, and chambers, and shops, can only be regarded, after recent experiences, as an act showing the grossest disregard of human life, and one that should never receive the sanction of the authorities.

## POTTERY IN WALLS.

A PAPER has been communicated by Mr. Alexander Hutcheson, architect, Dundee, to the Society of Scottish Antiquaries, upon the discovery of earthenware jars in the walls of a house in Dundee. It is as follows:—

During the removal of several old buildings on the south side of Nethergate, Dundee, to make way for a new street, in the month of July last year, Mr. George Lowdon, optician, Dundee, called my attention to certain "jugs" or jars which, he said, were to be seen built into the walls of one of the old houses about to be demolished. I lost no time in visiting it. The building was (for it has since been removed) of three storeys in height, with attics in the high pitched roof, which was covered with grey stone slates, and filled up the whole space between two narrow passages called Scott's Close and Harris's Close, the former being on the west side of the building, and close to the site of Whitehall Palace, said to have been used as a residence at different times by James IV., James V., Mary, James VI., and Charles II. It was on this side that the jugs were seen. Three of them were placed in an almost equilateral triangle between two of the west windows of the upper floor, and two at the south side of a window at about the same level in a little room occupying the top of a projecting stone staircase. A sixth jug was afterwards discovered at the north side of the northernmost of the two centre windows, when the roof of a cross two-storey wing was removed. All the jugs were built into the outside of the wall, and had their orifices flush with the face of the wall. When the wall was broken down, the jugs were found to be of various shapes, but all of a reddish-brown glazed ware, having handles on one side. One of the specimens had evidently never been used previous to being built into the wall, because some of the scoræ of the kiln still adhered to the bottom of it. When placed in the walls the jugs lay horizontally, with the handles to one side. Two of the jugs were very much decayed, so much so that only fragments of them remained in the holes. Others were fairly preserved. One of them measured 3 $\frac{3}{4}$  inches across the mouth, widening out slightly in the inside, by 4 inches deep. The remaining two measured 2 $\frac{1}{2}$  inches across the mouth. Great care was exercised when the walls were broken down, but only two of the jars could be taken out tolerably whole; and these are to be deposited for preservation in the Dundee Museum. The jugs all adhered so firmly to the mortar, and some of them were so much decayed that they crumbled to pieces on the mortar being broken. To all appearance they had been built into their places when the wall was originally erected.

My friend, Mr. A. C. Lamb, F.S.A. Scot., who was most assiduous in his efforts to secure the safe removal of the jugs, recalled to my recollection the discovery at a prior date of a similar arrangement of jugs in another old building, known as Wedderburn's Land, which stood further to the south. In this case the jugs were placed at regular intervals beneath the sills of the upper floor windows. Unfortunately, in this instance none of the jugs were got out whole, and the fragments were not preserved. One of the jugs was stated to have been of a curious green glass, and of antique shape. The tradesman who told me this remarked that he

had seen other examples in the town; but a most careful search in the localities he indicated failed to discover them, nor, in being appealed to, could he point them out, and probably the buildings where they occurred have also been removed.

In the course of my inquiries I learned that, so far from the jugs being confined to the outside of Wedderburn's Land, the workmen who took down the walls discovered them in great numbers in the inside walls of the staircase. The staircase was a wide and ample rectangular adjunct on the west end of the main building, and was separated therefrom by a thick stone wall or gable, and it was in this wall, as well as in the front or outer wall of the staircase, that the jugs were found in such numbers; and as in the building in Scott's Close, they were laid horizontally, and had their mouths flush with the inside face of the wall. In this case, being towards the inside of staircase, the openings were all plastered over, but the jugs had not been filled with the plaster, of which there was only so much in the neck or mouth of each jug as was sufficient to hold the plasterwork.

The use of jars or vases in architecture is not unknown, but so far as I am aware no instance has been previously noted of their use in the walls of dwelling-houses. It has been suggested that these jugs may have been intended for birds'-nests. Instances occur in Continental cities of provision having been made in steeples for this purpose. Fosbroke says that pigeon-holes were common in the roofs of Roman houses, and mentions that the upper storey of Egyptian houses is almost always devoted to pigeons.

On a review of the case, I should be inclined to ascribe this instance of the use of jugs to some superstitious observance now forgotten. It must ever be regretted that such an interesting example of this curious architectural feature as that presented by Wedderburn's Land should have been swept away without any skilled examination being made, and thus the opportunity perhaps lost for ever of throwing light on what cannot but be regarded as an omitted, because unsuspected, chapter in the history of the domestic architecture of Scotland.

### PRIMITIVE LAND VALUATION.

A PAPER was read at the last meeting of the Society of Antiquaries of Scotland, on an investigation of the system of land valuation in the Orkney and Shetland Isles, by Captain F. W. L. Thomas, R.N., F.S.A. Scot. The whole subject of early land valuation, he observed, is involved in almost impenetrable obscurity. The special task which Captain Thomas had before him in the present paper was to deduce from existing materials the answer to the question—What is a pennyland? This term is of frequent occurrence in connection with the ancient land valuation of the Hebrides, and as the Hebrides were under Norse dominion till 1266, it appeared probable that a solution of the question would be best found by an examination of the land system of the northern isles. The Orkneys continued to be part of the Norwegian kingdom till 1468, and even then, being merely pledged to James III., they were still ruled by their own laws, which, as regards land tenure, were almost the opposite to those of Scotland. The materials for the investigation are chiefly contained in the rental of the earldom of Orkney, 1497–1503, or within twenty-nine years of the separation from Norway, which is still preserved. In the fifteenth century the land of the Orkneys was, in respect of property, either Earl's (subsequently King's) land, Kirk land, or Odal land. The first two terms required no explanation. The Odal men, who owned land simply by descent, became in course of time so numerous that the constant subdivision of the Odal lands necessarily led to poverty and degradation; and the want of a middle class left them still less able to resist the rapacity of the Scottish earls and feuars, and the donatories of the Crown. In respect of taxation (or skat) for support of the Earl's government, the lands of Orkney were either Bordland, Skatland, Quoyleland, or Towmale. Bordland, being the property of the Earl, paid no skat. Skatland, otherwise called Odal land, included all the arable land of the townships which existed when the ancient or original valuation roll was made. Quoyleland, from being subsequently enclosed, as a rule paid no skat. Though the arable land was frequently repartitioned among the tenants, the house remained in constant possession of the household, and a small piece of pasture land around it was the towmale or tumail. As the demand for arable land increased, the towmale was dug up or ploughed up. No skat was paid for moorland or "fell." It was considered of so little importance that it is not once named in the rental. Wherever lands are taxed, there must be a valuation of some kind—in old records called extent; and for this purpose the Orkneys had at an early period been divided into parts, which came to be denominated urislands or ouncelands, but which there is reason to believe originally were the davach of the former Celtic inhabitants. The meaning of ouncelands was that each paid to the Earl money or produce to the value of one ounce of silver. The ounceland was divided into eighteen parts, each of which had to pay one penny, or the value of one penny, and hence was called a pennyland. The demonstration of this by a detailed analysis of the rental,

along with separate demonstrations of the same nature, for the different denominations of land and land values in Shetland formed the substance of the paper. The general conclusions arrived at were that the davach of the old Celtic inhabitants, being assessed by the Norwegian earls at an ounce of silver, became an ounceland, and was divided into eighteen parts, each paying an eighteenth of a Norse ounce of silver, which was equal in weight to an English penny, from which each subdivision was termed a pennyland. Neither ounce nor pennyland was a measure of surface, but of produce. The ratio of produce must in time have altered, but nominally the tax was not increased. At some period, of which there is no record, but probably in the twelfth century, the pennylands were valued at their purchase, not their annual value, in sterling silver marks—each part so valued being called a markland—at which time the average value of a pennyland was four sterling marks. In the Orkneys, in 1503, the rent of a markland was so nearly uniform as to suggest that the rate of rent had been fixed at a comparatively recent period. In Shetland the assessment by ounces and pennies was abandoned, and that by marks was substituted. The annual rent of a markland was fixed in pennies, and varied from four to twelve pennies, which were paid in fixed proportions of butter and cloth. Mr. G. Goudie and Professor Duns remarked upon the great importance of this paper as a foundation for future inquiries into a subject so complicated and obscure, and which had hitherto baffled the investigation of the most distinguished antiquaries.

### American Elevators.

SIR,—Permit me to call your attention to the following paragraph, which I copy from a New York paper. The remarkable results obtained by the use of our Standard Hydraulic Elevator (as fixed by our New York house, Messrs. Otis, Brothers & Co.) will certainly be a matter of interest to your readers. The ability not only to erect high buildings, but to get as much or even more rent for the upper floors as for the lower floors, is a direct consequence of the use of the elevator, but this result is not reached unless it is made certain that the elevator service is abundant, rapid, inexpensive as to cost of running and maintenance, and (most important of all) absolutely to be depended upon for every day in the year. These results are obtained by the use of our elevators, which have made it possible for Mr. Field to follow the example set him by so many others.

### "New York's Big Buildings."

"Cyrus W. Field has completed his new structure, the Washington Building, at the Battery, and applicants for rooms are so numerous that almost any price can be asked. There are five elevators in the building, and consequently the upper floors bring more money than the lower ones. An idea of the traffic done in one of these huge buildings may be formed from some statistics which Mr. Field has gathered. On an average 18,000 persons a day pass in and out of the Produce Exchange Building, the Mills Building 13,000, the Boreel about 10,000, and the Equitable Life about 15,000."

Yours obediently,  
WM. AUG. GIBSON, President.

American Elevator Company, Old Jewry, E.C.

### ARCHÆOLOGY.

**The Old Hall, Leyland.**—Some improvements are now being made at an ancient farmhouse at Leyland, known locally as "Towd Ha'," and the workmen lately discovered a passage which was traditionally believed to communicate with the parish church, more than half a mile distant. It was found, however, to extend only from the first floor to the ground floor, and was probably a priest's hiding-place, being in all respects similar to those found in residences erected between 1570 and 1680, during the severe persecutions of the Roman Catholic clergy. The Old Hall was built by Robert Charnock, father of Robert Charnock, a priest, whose *alias* was Manley when in hiding. The stone over the principal entrance bears the date 1620, and the crest of the Charnocks, with the letters "I.H.S." in the upper left hand corner, and "M.R." in the right hand corner. There are other monograms which cannot be correctly deciphered. Very great interest in the old place has been raised by the discovery of a recess used as a sanctuary by Father Charnock, and four hiding places, two of which are in the roof where the vestments and sacramental vessels were secreted, one adjoining the chimney, and the fourth above described.

**Discoveries in Upper Egypt.**—Professor Maspero, returning from his annual trip of inspection up the Nile, has just found an unplundered necropolis of immense extent at Ekhmeem, a large provincial town of Upper Egypt, situate about half-way between Assiout and Thebes. As far as has been yet ascertained, the necropolis dates from the Ptolemaic period; but as the work of exploration proceeds it will probably be found that it contains more ancient quarters. The riches of this new burial field would meanwhile seem to be almost inexhaustible. Five great tombs or catacombs already opened have yielded 120 mummies, and within the short space of three hours Professor Maspero verified the sites of over one hundred more similar catacombs, all absolutely intact. The necropolis of Ekhmeem, at a rough estimate, cannot contain fewer than five or six thousand embalmed dead. Of these perhaps not more than twenty per cent. will turn out to be of archaeological or historical value; but the harvest of papyri, jewels, and other funeral treasures cannot fail in any case to be of unprecedented extent. Ekhmeem is the ancient Khemnis—the Panopolis of the Greeks. Its architectural remains are insignificant.

**Pompeian Revival.**—Early next month festivities will be held at Pompeii after the manner of the ancients. The first day a circus will be opened by an imperial procession. At its head the emperor will be borne on a litter, followed by five hundred senators, clients, prætorians, lictors, priests, and a crowd of plebeians. On the second day a nuptial procession will be represented, and in the evening the funeral of a military tribune will take place. The procession will leave the House of the Faun, and, passing through the *Decumanus minor*, will proceed to the Street of Tombs, where the funeral pile will be erected. On the third day, gladiators of all classes will perform in the ancient amphitheatre of Pompeii, in the presence of the emperor, on which occasion the imperial train will be increased by a guard of prætorians on horseback.

## CHURCH BUILDING AND RESTORATION.

**Barnham.**—The foundation-stone of a Primitive Methodist chapel has been laid. The architect is Mr. J. A. Hillam, of King's Lynn, and the builder is Mr. Joseph Palmer, of Thetford.

**Belper.**—St. Peter's Church, Belper, has been reopened after undergoing extensive internal alterations and renovation. All the old-fashioned, uncomfortable, straight-backed narrow pews and the floor of the church have been taken away, and replaced in the nave and aisles with slightly red deal stalls, and in the choir with pitch pine stalls. Additional accommodation has thus been provided. A new wood flooring has been laid down in the first-mentioned, and a tile flooring has been placed in the choir and chancel. A new pulpit and reredos of oak with tracery panels, turned shafts, caps, and bases, have been put in, and marble steps have been placed to the communion rail and table. The interior has been re-painted and decorated. Mr. Fletcher, of Derby, has been the contractor for the seating and flooring; Messrs. Ford & Co., Derby, supplied the pulpit and reredos; Mr. Swaines Bourne, of Birmingham, the windows; and Mr. Hibbert, of Belper, did the painting. The work has been carried out under the superintendence of Mr. F. J. Robinson, architect, Derby.

**Blythburgh.**—The parish church has been reopened after the completion of certain works of restoration, principally affecting the south aisle. The work has been carried out by Mr. R. J. Allen, of Southwold, under the direction of Mr. A. E. Street, M.A.

**Brimsfield.**—St. Michael's Church, Brimsfield, has been reopened after restoration, which has been carried out by Mr. Charles Gyde, of Pitchcombe, under the direction of Messrs. Waller, Son & Wood, architects, Gloucester, at a cost of 800*l*.

**Dunfermline.**—A Baptist church, erected from the designs of Mr. P. S. Henderson, of Edinburgh, has been opened. The church will accommodate about 350 persons on the ground floor, and 250 in gallery, and is estimated to cost about 3,000*l*, including site.

**Etwell.**—A Wesleyan chapel, erected at Etwell, has been opened. The building is of red brick, with dressings of Stanton-by-Ashborne stone, in the Gothic style of the Pointed period. Mr. Garlick, of Burton-on-Trent, is the architect, Mr. H. C. Mellor, the contractor, and Mr. Bassett did the masonry work.

**Forest Gate.**—The new church of St. Saviour is situate at the angle of the Macdonald and Station Roads, upon a site presented by Canon Carver. The style is Early English; the material of the walls internally and externally is red brick, Bath stone being freely used for windows, doorways, arches, &c. The church consists of nave, chancel, north and south aisles, and transepts, and is arranged to seat 1,000 people. The total internal length is about 140 feet, the height 42 feet, and the width 60 feet. The nave, 27 feet in width, comprises seven bays, the arcade on either side consisting of Bath stone columns and moulded arches, having a series of clerestory windows over them. The chancel, 32 feet long, and about the same height and width as the nave, is lighted at the east end by five lofty lancet windows, and by a rose window at the apex of the gable. The roof from end to end of the

church is waggon vaulted, the line between nave and chancel being defined only by the lofty chancel arch, which is carried up to the apex of the vault, and is concentric with the curves of the ribs of the roof. The ribs bear upon detached grey stone shafts which rest upon sculptured corbels of intricate conventional foliage. The corbels are the gifts of various friends. On the south side of chancel is a spacious organ chamber, on the north side two vestries (clergy and choir) capable of being thrown into one when required for meetings, &c. Ample means of ingress and egress are provided by means of south porch, a lobby at west end of north aisle, and a temporary porch occupying a portion of the site of the future tower and spire. A font of Caen stone resting on marble shafts, and enriched with carving, has been given by the Sunday-school children. The church has been erected from the designs of Mr. Edwin Clare, F.R.I.B.A., the contractor being Mr. J. Morter. The carving has been executed by Mr. Allen, the heating and lighting by Messrs. Y. D. Berry & Sons. The total cost of the works, exclusive of special gifts, will be 7,500*l*.

**Ilminster.**—St. Michael's Church, the parish church of Ilminster, has been opened after having undergone complete restoration at a total cost of 1,700*l*. The restoration has been completed under the direction of Mr. E. H. Harbottle, architect, of Exeter.

**Kingsbury.**—The Bishop of London on Tuesday morning consecrated a new church at Kingsbury. It stands on high ground, and forms a picturesque object from the Midland Railway. The church, which consists of nave and chancel, porch, organ-chamber, and vestry—the three latter the gift of the architect, Mr. Butterfield—has been substantially built by Mr. Norris, of Sunningdale.

**Llanbeder.**—The foundation-stone has been laid of a Methodist chapel at Llanbeder, near Crickhowell. Mr. Aaron Davies, of Pontytlottyn, is the architect. The building will seat about 150 persons. It will be built in the Norman style, the materials being pressed red bricks, with white dressings. The interior—seats and rostrum—will be of pitch pine, and the building will be heated by one of Holden's patent stoves. Mr. J. Bruton and Mr. John Jones are the builders.

**Morpeth.**—A Wesleyan Methodist chapel has been opened in Manchester Street. The building occupies the site of the former chapel and of a caretaker's house which adjoined it. The ground slopes rapidly from front to back, and advantage has been taken of this to obtain in the basement a schoolroom, 36 feet by 23 feet, together with a large vestry and classroom. To give sufficient height to these rooms, the floor of the chapel is raised 5 feet above the street level. Externally the chapel measures 55 feet by 40 feet. The front, which is designed in the fifteenth-century Gothic style, contains two deeply-moulded and recessed arched doorways. Surmounting these is a central gable 45 feet high, and containing a large traceried window of five lights. The lower wing walls on each side of this gable are also pierced by two tiers of windows similarly treated. The whole front, which is built of Nunriding stone, is very effective, and is a great ornament to that part of the town. Internally the pews, rostrum, gallery front, &c., are of pitch pine, and are effectively designed and arranged, ornamental perforations playing an important part in their treatment. The chapel is seated for 360 persons, and the entire cost is 1,600*l*. The warming apparatus is by Messrs. Dinning & Cooke, of Newcastle; the gasfittings by Messrs. Jones & Willis, of Birmingham; and the ventilation by one of Boyle's air-pump ventilators. The lead glazing is by the Gateshead Stained Glass Company. The contractor for the whole is Mr. D. M. Spence, of Amble; and the architects are Messrs. S. Oswald & Son, of Newcastle-on-Tyne, under whose superintendence the work has been executed.

**Prestwich.**—The ringing of the old peal of bells in the tower of the parish church has been resumed. In the summer of 1880 an alarm was given by the ringers that the tower was unsafe, and that the cracks already existing in the masonry were extending. After an examination by Messrs. Medland & Henry Taylor, architects, of Manchester, it was decided to thoroughly restore the tower, and the work is now all but completed. The tower is now stronger and more stable than it has been probably at any previous period of its history. Improvements have also been effected in other parts of the edifice. The western gallery has been removed, and the fine tower arch and windows thrown open to the church. The ancient oak ceilings of the nave and chancel have been carefully restored, and the roofs strengthened, repaired, and reslated. New oak roofs are being placed in the north and south aisles in lieu of the much-decayed old timber, but the old design has been strictly followed. Designs have likewise been made and a faculty obtained for the enlargement of the vestry and for a new organ chamber.

**Stainland.**—The Wesleyan chapel at Stainland has just been reopened after undergoing renovation and improvement. The work has been carried out under Mr. T. L. Patchett, architect, Stainland.

**Warley.**—Plans have been prepared for a new vicarage for St. John's, Warley, by Mr. C. F. L. Horsfall, architect, Halifax. It will occupy the spare ground close by the church and schools. All the outside walls are to be built with cavities, so as to effectually exclude damp.

**Wotton-under-Edge.**—The work of restoring and re-seating the parish church of Wotton-under-Edge has been completed. The work has been carried out by Mr. R. Fisher, builder, of Wotton, under the direction of Messrs. Waller, Son & Wood, architects, of Gloucester.

### SCHOOL BUILDINGS.

**Darlington.**—The foundation-stones for a new Sunday school in connection with East Road Wesleyan Chapel have been laid. The cost of the building, including land, will be 1,859*l.*, Mr. F. W. Brooks, of Darlington, being the architect.

**Earlsdon.**—The memorial-stones of a Wesleyan chapel and school have been laid. The cost of the building will be about 800*l.* Mr. W. Tomlinson, of Coventry, is the architect, and Mr. A. Beacham, of Allesley, the builder.

**Leith, N.B.**—The Leith School Board have decided on an extension of the Victoria School, Newhaven. The cost of the extension is estimated at 2,150*l.*, extra accommodation being provided for 240 children.

**Romford.**—The memorial-stone of a school and classrooms being erected in rear of the Congregational Church has been laid. Accommodation will be provided for 350 children. The exterior of the building will be faced with Kentish rag stone, with Bath stone dressings, the style being an early kind of Gothic, similar to the church. The architect is Mr. E. C. Allam, of Romford. Mr. William Wood is the builder.

**Stalham.**—The foundation-stone of a Baptist chapel and school has been laid, accommodation for 400 in the chapel and 200 children in the school being provided. Mr. George Baker, of Queen's Road, Yarmouth, is the architect, and Mr. W. Evans, of South Walsham, the builder. The cost will be about 1,520*l.*

**Workington.**—A school for 250 infants has recently been erected for the Workington School Board, at Westfield, which has cost 3*l.* per head; this is to be supplemented with a department for 250 boys, at a cost of 3*l.* 15*s.* per head, exclusive of fittings. The boys' school is to be built of rubble and brick, with stone dressings, cemented on outside and rough cast, plastered on the inside, with a wood dado 4 feet high. The whole of the carpenter and joiners' work picked Baltic, 1½-inch tongued narrow batten floors, and all internal work to be stained and varnished. The site of the school is a mile and a half from any quarry or station. Mr. James Howes is the architect.

### ART WORKMANSHIP.

**Edinburgh.**—A new mantelpiece was on Monday added to the northmost fireplace in Parliament House similar in construction to that enclosing the fireplace near the south end. Constructed of dark-coloured oak, this latest addition to the ornaments of the noble hall has a broad and massive shelf, supported on each side by two fluted pilasters, with carved capitals, showing cherub faces surrounded by wreaths of leaves and fruit in relief. The lintel panels, three in number, are separated by trusses bearing carved satyrs in relief, and enclose reliefs of scenes from "The Merchant of Venice." Reading from right to left, the first presents Shylock and his friend in conference before entering the Court. In the next appears the Court scene, and the third shows the discomfited Shylock leaving the scene of his humiliation. The mantelpiece, which is dedicated by Mr. Charles Robertson, advocate, to the memory of his father-in-law, James Walker of Dalry, advocate, was designed by Mr. W. Adam, Queensferry Street, Edinburgh, the carved work being executed by his workmen. The similar mantelpiece at the other end of the hall was dedicated by Mr. Robertson to the memory of his father, George Robertson Scott, of Benholm, advocate, and was also designed and erected by Mr. Adam.

### GENERAL.

**Mr. Alfred Gilbert** is about to leave Rome and settle in London. Sir Frederick Leighton has already purchased Mr. Gilbert's contribution to the forthcoming Academy Exhibition, and has also given the young sculptor a commission for a work which may be ready for the exhibition of 1885.

**A Painting** by the late Mr. F. P. Poole, R.A., *The Beleaguered City*, has been presented to the Wolverhampton Art Gallery by Mr. E. Shaw. Two pictures by the local artist, Mr. Bird, R.A., have also been presented by Mr. H. Loveridge, viz., *The Birth* and *The Christening*.

**Mr. John Sparkes**, of the Art Training School at South Kensington, will write a handbook on "The Influence of Schools of Art on Manufactures," which will form one of the series to be issued in connection with the Health Exhibition.

**The Exhibition of French Decorative Art** in the Corporation Galleries, Glasgow, will be closed on Wednesday. The collection

of pictures by old masters which has been exhibited for the past year in the Bethnal Green Museum will be transferred to the Glasgow galleries.

**The Art Exhibition at Chester** has been postponed for a few weeks, in consequence of the death of the Duke of Albany. The delay will give opportunity for more extended arrangements.

**The City of London Society of Artists and Guildhall Academy of Art** have elected the following artists as members, viz.:—Messrs. Phil. Morris, A.R.A., Chas. Burt, Robt. Barnes, A. M. Rossi, Wm. Linnell, Leslie Thomson, V. P. Yglesias, and Chas. Sney.

**A Lecture on "Art applied to Coach-Building"** will be delivered at the Westminster Town Hall on next Tuesday by Mr. H. Julian.

**A Portrait of William Murdoch**, the inventor of gas-lighting and the maker of the first locomotive in England, has been presented to the Art Gallery of Birmingham.

**The Fragment of Mosaic Pavement** discovered in the excavations for the extension of the District Railway has been claimed by the authorities of the parish of St. John the Baptist Walbrook.

**A Carved Alabaster Memorial Reredos** has been placed in St. Mary's Church, Lawford. It was designed by Mr. C. F. Hayward, of Montague Street, Russell Square, and executed by Mr. Earp, of Lambeth.

**St. Mary's Church**, High Offley, is proposed to be restored. The church is an ancient Gothic building, the register dating from the year 1689, and greatly needs restoration. The roof of the nave, said to be one of the finest in the county, is at present hidden by a wooden ceiling.

**Manchester Society of Architects.**—The Society prize (value 5*l.* 5*s.*) offered for the best essay on the Manchester Cathedral has been awarded to Thomas Locke Worthington. The essay comprises an historical and architectural description of the cathedral from its foundation, with illustrations. Mr. James P. Holden's prize (5*l.* 5*s.*) for the best set of measured drawings of the Renaissance tombs in the old churches in and about Manchester, has been awarded to Frank L. Heslop.

**The Designs of Mr. Wm. Owen, A.R.I.B.A.**, 134 Deansgate, Manchester, have been selected, in open competition, for the new Post Office buildings to be erected at Knutsford, Cheshire.

**Mr. W. I. Chambers**, Dublin, has been appointed by the Presbyterians of Dundalk as architect for extensive improvements contemplated by them, including new hall, school residence, &c.

**Mr. Stephen Shaw**, of Kendal, has been appointed architect for the new church and tower at Crook, near Kendal, his design having been accepted in a limited competition.

**An Anonymous Subscriber** has contributed 500*l.* to the fund for the completion of the Edinburgh University Hall.

**Miss Carter**, of Haslingden, has given 3,000*l.* for a new church in the Stonefield district of the parish.

**Belmont Castle**, the seat of the Earl of Wharcliffe, near Coupar-Angus, in Perthshire, was destroyed by fire on Monday night. The castle was in the ancient baronial style, and was recently remodelled. Several valuable pictures were among the property destroyed.

**A Public Hall** is to be erected at Kenmore, N.B., from a design by the Countess of Breadalbane. The memorial-stone was laid on Monday last by the Earl of Breadalbane.

**The Fishmongers' Company** have voted an additional sum of 4,000*l.*, to be paid in two annual instalments, to the Equipment Fund of the Central Institution of the City and Guilds of London Institute.

**The Carpenters and Joiners of Berlin** have resolved to demand from employers (1) the reduction of the hours of labour to nine and a half hours, (2) suspension of all work on Sunday, and (3) a higher rate of wages, on pain of a strike.

**Mr. Parker**, City Surveyor, Hereford, has served a notice upon the vicar and churchwardens of All Saints Church, requesting them to either pull down or repair the steeple, which he pronounces to be unsafe. Of late many pieces of masonry have fallen away from the steeple.

**The Chamber of Commerce of Carrara and Massa** has recently published two statistical reports on the production of marble during ten years from 1873 to 1882, from which it appears that Carrara and Massa produced 1,454,403,040 kilogrammes of marble, of which 1,184,803,888 were exported.

**Sir Edward Watkin** has under consideration plans for the erection of houses for the poor which shall come in more direct competition with the existing lowest class accommodation than do Peabody's Buildings. In these buildings the average rent of each dwelling is 4*s.* 8½*d.* a week, and for each room 2*s.* 1½*d.* Sir Edward Watkin has asked for tenders for rooms that may be let at 1*s.* 6*d.* a week, or even under. These are now being prepared, and should they show the plan to be feasible the buildings will forthwith be commenced.

# SUPPLEMENT

TO THE

# ARCHITECT

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, APRIL 26, 1884.

### COMPETITIONS OPEN.

**DERBY.**—June 2.—Designs are required for the Erection of a Pauper Lunatic Asylum for the Borough at Rowditch. Premiums of £100, £75, and £50. Mr. Thomas Coulthurst, Borough Engineer, Full Street, Derby.

**SUNDERLAND.**—May 19.—Designs are invited for Laying out Twenty Acres of Land, the Mill Farm and Broad Meadows, Durham Road, Sunderland, for Villas, Terraces, or Street Rows, with Sewerage, &c. Premiums of Thirty and Twenty Guineas. Messrs. Duncan & Duncan, Solicitors, 3 Market Place, South Shields.

### CONTRACTS OPEN.

**BELTHORN.**—April 30.—For Rebuilding Chapel. Mr. J. Yates, Architect, 3 Tackett's Street, Blackburn.

**BOLTON.**—April 28.—For Building Mill. Messrs. Bradshaw & Gass, Architects, 19 Silverwell Street, Bolton.

**BOX.**—April 29.—For Enlarging Church. Mr. J. D. Sedding, Architect, 18 Charlotte Street, Bedford Square, W.C.

**BRIGHTON.**—April 28.—For Enlargement, &c., of Station Offices. Mr. A. Sarle, London Bridge Terminus.

**CAIRNBATHIE.**—May 3.—For Building Dwelling-house. Messrs. Cochran & Anderson, Advocates, 152 Union Street, Aberdeen.

**CARLISLE.**—May 15.—For Building Sewage Screening Chamber, &c. Mr. H. U. McKie, City Surveyor, Town Hall, Carlisle.

**CARLISLE.**—May 15.—For Building Fire-engine Station. Mr. H. McKie, City Surveyor, Town Hall, Carlisle.

**CARLINGHOW.**—April 26.—For Building Parsonage. Mr. Michael Sheard, Architect, Batley.

**CASTLEFORD.**—April 30.—For Building Residence and Surgery. Mr. J. H. Brewerton, Architect, Castleton.

**COLNE.**—April 28.—For Construction of Outfall Sewerage Works. Mr. Henry Bancroft, C.E., 83 Mosley Street, Manchester.

**DARLINGTON.**—April 30.—For Building Inspector's House and Six Cottages. Mr. W. Bell, Architect, Railway Offices, Northgate, Darlington.

**ELLAND.**—April 28.—For Building Six Houses. Mr. William Ackroyd, Southgate, Halifax.

**FREMANTLE.**—April 26.—For Building Girls' School. Mr. W. J. Bunney, Grosvenor Villa, Shirley Road, Southampton.

**GATEHOUSE OF FLEET.**—April 30.—For Building Town Hall. Mr. J. R. Pearson, Architect, 74 George Street, Edinburgh.

**GLASGOW.**—May 7.—For Building Workmen's Houses. Messrs. Thomson & Turnbull, Architects, 122 Wellington Street, Glasgow.

**GRANGETOWN.**—May 5.—For Building Sixty-two Cottages. Messrs. James, Seward & Thomas, Architects, St. John's Square, Cardiff.

**GRAVESEND.**—For Boat Sheds, Dressing-room, &c., for the Rowing Club. Mr. E. Bennett, Architect, Gravesend.

**HAINWORTH.**—April 26.—For Building School. Mr. Bailey, Architect, 9 Market Street, Keighley.

**HANSLOPE.**—For Rebuilding Spire of Church. Mr. J. O. Scott, Architect, 31 Spring Gardens.

**HOMERTON.**—May 14.—For Building Ambulance Station. Messrs. A. & C. Harston, Architects, 15 Leadenhall Street, E.C.

**KILWENDEAGE.**—May 5.—For Additions to Mansion. Mr. G. Morgan, Architect, 24 King Street, Carmarthen.

**KIMBERLEY.**—For Building Chapel and Schools. Mr. A. H. Goodall, Architect, Nottingham.

**LEEDS.**—April 26.—For Works in Erection of Coach Builder's Premises. Mr. D. Dodgson, Architect, 18 Park Row, Leeds.

**MARYPORT.**—April 29.—For Building Dwelling-house. Messrs. Eaglesfield & Son, Architects, Maryport.

**MIDDLESBROUGH.**—April 30.—For Passenger Station at Whitehouse Crossing. Mr. W. Bell, Railway Offices, Northgate, Darlington.

**MIDLAND RAILWAY.**—May 2.—For Building Stables, Loose Boxes, &c., West Kensington. Clerk of Works, 111 St. Pancras Old Road, N.W.

**NATIONAL GALLERY.**—May 5.—For Extension of Buildings. Office of Works, 12 Whitehall Place, S.W.

**NEWTON STEWART.**—May 3.—For Building M'Mullan Hall and Additions to Machermore Castle. Mr. Richard Park, Architect, Newton Stewart.

**NORWICH THORPE.**—May 1.—For Building Railway Station. The Engineer, Liverpool Street Station, E.C.

**OVERTON.**—April 26.—For Erection of Farm Buildings. Mr. John Hillary, Longparish, Hants.

**SALISBURY.**—For Building House. Messrs. J. Harding & Son, Architects, Salisbury.

**SHARPLES.**—April 28.—For Building Schools and Porter's Lodge, &c., to Eden Orphanage. Messrs. Bradshaw & Gass, Architects, 19 Silverwell Street, Bolton.

**SHAYINGTON-CUM-GRESTY.**—May 5.—For Enlargement of Board School. Mr. Bower, Architect, Nantwich.

**SOUTH SHIELDS.**—April 28.—For Additions to Infant School. Mr. J. H. Morton, Architect, South Shields.

**SWINDON.**—April 30.—For Building Schools. Mr. W. H. Read, Architect, Swindon.

**SWINDON.**—May 14.—For Erecting Block of School Buildings. Mr. W. H. Read, Architect, Swindon.

**URTON CROSS.**—April 29.—For Erecting Block of School Buildings. Mr. J. T. Newman, Architect, 2 Fen Court, E.C.

**WALSALL.**—May 10.—For Erection of Farm Buildings and other Works at Brockhurst Farm for the Corporation. Mr. Samuel Wilkinson, Town Clerk, Bridge Street, Walsall.

**WARLEY.**—May 3.—For Building Parsonage, &c. Mr. C. F. L. Horsfall, Architect, Lord Street Chambers, Halifax.

**WARRINGTON.**—May 5.—For Extension of Market (Foundations). Mr. T. Longdin, Borough Surveyor.

**WELLINGTON.**—May 1.—For Additions to Board Schools. Mr. Randal, Architect, Betton House, Shrewsbury.

**WEST HARTLEPOOL.**—May 1.—For Building Church. Mr. J. Garry, Architect, 1 Church Street, West Hartlepool.

**WESTLEIGH.**—April 30.—For Alterations to Buildings at Print Works. Mr. E. Godward, Architect, New Mills, near Stockport.

**YORK.**—May 1.—For Building House and Premises. Mr. W. G. Penty, Architect, 34 Coney Street, York.

**YORK.**—April 29.—For Building Six Cottages. Mr. W. Brown, Architect, City Chambers, Clifford Street, York.

### TENDERS.

#### ABBEYLEIX.

For Building Dwelling-house at Abbeyleix, for Lord de Vesci. Mr. W. I. CHAMBERS, Architect, Dublin.

HARRIS, Monasterevan (accepted) . . . £2,060 0 0

N.B.—There were five estimates, ranging from £2,500 to the accepted one, which was subsequently reduced to £1,800 by omitting portions of the work.

#### ALPHINGTON.

For Building Dwelling-house and Offices, Alphonson, for Mr. F. Loram. Messrs. J. W. ROWELL & SON, Architects, Newton Abbot and Torquay.

Pullen, Exeter . . . . . £1,568 9 0

Moass & Son, Exeter . . . . . 1,425 0 0

Turner & Skinner, Honiton . . . . . 1,413 5 0

Coles & Knott, Alphonson . . . . . 1,317 8 0

Gibson, Exeter . . . . . 1,275 0 0

Gale, Exeter . . . . . 1,272 13 9

Manley, Exminster . . . . . 1,250 0 0

Gooding, Exeter . . . . . 1,201 18 0

PERKINS & HOLMES, Alphonson (accepted) 1,034 10 0

AWARDED SEVEN PRIZES FOR SUPERIORITY, INCLUDING PARIS GRAND MEDAL, 1878, THE CERTIFICATE OF MERIT OF THE SANITARY INSTITUTION OF GREAT BRITAIN, AND THE AWARD OF MERIT AT THE INTERNATIONAL EXHIBITION, 1881.

TO ARCHITECTS.—THE BRICK of the FUTURE, that shall not get dingy or sooty like other Bricks, but, being of a Semi-Vitreous nature, will maintain a clean and washable surface.

## FACING BRICKS AND BRICK ORNAMENT OF TRUE TERRA-COTTA, AS ALSO ARCHITECTURAL WORK, IN WHITE AND WARM-TINTED BUFF.

Made from the Finest Terra-cotta and Stoneware Clays, of a warm and pleasing appearance, of beautiful and superior quality and finish, non-absorbent, acid, fire, and alkali proof, will resist the most severe frosts, and when tested were found to withstand a pressure of 445 tons to the square foot. They have been used in the most exposed parts on the North and South Coasts, and being true Terra-cotta, are warranted imperishable.

Pattern Sheets and Price Lists of superior Glazed Stoneware Sanitary Pipes, and Fire Clay Goods, Chimney Tops, &c., on application.

Sole Manufacturers:—CANDY & CO., Limited, GREAT WESTERN POTTERIES, NEWTON ABBOT, AND 11 QUEEN VICTORIA STREET, LONDON, E.C. Who are also Sole Makers of the celebrated "Granite Vitrified" Paving Bricks for Yards, Stables, and Footpaths, and "Granite Vitrified" Damp-proof Building Bricks, as used by H.M. Government for dock construction, &c. Samples free to Architects and Engineers.

**PATENT WROUGHT-IRON SASHES AND WROUGHT BOSSES**

SPECIALLY ADAPTED FOR WAREHOUSES, SCHOOLS, AND PUBLIC BUILDINGS.

CABLE LIGHT

The Patentee begs to call particular attention to the great strength of this construction. The Bars and Bosses, being of malleable wrought iron, form an exceedingly firm joint at the intersection of bars. They are durable, and of light appearance, the Bosses being small and not unsightly. They can be made at very short notice, and at the price of an ordinary cast iron sash.

PRICES UPON APPLICATION.

CABLE LIGHT.

CLOSE BAR SASH (obviating use of Window Guards).

ORDINARY WAREHOUSE AND SCHOOL SASHES.

VENTILATOR

Back view of Boss, full size.

Section through Boss, full size.  
These can be placed flat, like ordinary wooden sashes, without the corners of the panes being chipped off.

Front view of Boss, full size.  
Obscuring no appreciable light.

## THE CONFERENCE OF ARCHITECTS.

THE holding of an assembly of architects from far and near every two or three years in London has now become an established institution, and one from which a good deal of benefit is, no doubt, to be derived. It is true that the attendance has not hitherto been so large as to accord with the activity of the profession throughout the country; but we may perhaps say with confidence that it is increasing rather than diminishing, and we do not hesitate to express the hope that the meetings which commence next

Monday may be all the better sustained.

Amongst the various subjects which at the present day offer themselves for the consideration of a conference of English, Scotch, and Irish architects, the most important are perhaps such as these:—education, pupilage, diplomas, points of practice, professional etiquette, competitions, artistic and building novelties, and the march of style in design. We propose, in the observations we have now to make, to confine our attention to such questions speculatively, and not in any way to interfere with the programme which has been issued for the actual work of next week, to which, indeed, we therefore need not further refer. Opportunities may arise, of course, for discussing such matters, no one knows how, even if they may seem to be entirely left out of the reckoning, which most of them are.

Education and pupilage are becoming every day of more and more importance in the architectural profession. The existing system at its best turns out rather too many young men rather too carelessly. From the office of professedly high rank in which you may place a lad at a hundred a year for as many or as few years as you please, taking him away when he is tired of it without a "Thank-ye" on either side, to the office of low rank or no rank—except perhaps in the dreamland of competition—where the youngster pays what he must; but as little as possible, and makes the best of it for three years or so, in learning the art of attractive drawing, tinting, hatching, sketching, lettering, and otherwise generally tickling double elephant to distraction, there seems to be pouring forth year after year an increasing stream of more or less smart and clever draughtsmen, concerning whom the question is being asked more and more earnestly and, indeed, urgently every day, What is to become of them all? To supplement a system of pupilage such as this, pointing either to an ever straitening press of rivalry or to a greatly expanding world of employment, the further scheme of education which we possess is not so easily described. No college as yet anywhere, nor even schools; scarcely even drawing-classes; South Kensington said to be woefully indolent in teaching; the Royal Academy class, admirable as it is, and most generously administered, palpably inadequate for so large a purpose; the Institute giving no sign of similar endeavour, and scarcely deserving of more than commendation for goodwill in rewards; the juvenile "Association" trying to fill in the gaps with classes of its own, and finding them but too thinly attended; this is the situation at headquarters in London. And in the provinces what? Little else than a struggle of diligence under difficulties, with the help of journalistic engravings and a few books, and a determination to get up to London some day. It is almost enough to ask how far this is sufficient for the training of English architects for the next generation, whose work may be so much greater probably than that of the present. The question ought to be answered.

Diplomas are in a very awkward way coming at last to something like a hearing. The examination of the Associates of the Institute is a bold experiment; and the extension of the test to the Fellows will be a bolder one still, if it is to be really tried. Why should we not start an examination also for amateurs? Speaking quite seriously, it is by no means so improbable a thing as some might suppose that a considerable number of valuable allies to the cause of artistic building might be induced to come forward. It would be with a very different aim, of course, from that of the purely honorary and

fictitious Honorary Associates of the Institute, if gentlemen professing a little knowledge of art in general, or a good deal of some one kind of minor or even major art in particular, could be encouraged to apply in this way for academical recognition on the ground of actual merit. The idea is at least worth discussing in the general interest of the public progress of art.

Of points of practice there are never wanting many that require settlement as time passes. The vexed question whether it is *infra dignitate* for country architects to be their own or each other's quantity surveyors is a matter of the kind just now. Again, whether a compromise of the standard commission charges, even in the face of poverty of resources, can be encouraged, or sanctioned, is a problem of the utmost practical moment. Information is continually reaching us of the shifts to which struggling men are driven—happily not so much in London now—in order to secure employment by what tradesmen call undercutting. Competitions, again, we still have always with us; their delusive temptations, their many, many disappointments, and their all too few and meagre rewards when any at all. The movement at present on foot for the introduction of skilled adjudication as a public rule, by a combination of all sorts and conditions of possible and impossible, real and imaginary competitors, is advancing apace; but whether anything effective is ever to come out of all this mere signing of names by the hundred is a serious question for discussion.

Professional etiquette amongst English architects there is virtually none; and some people think the state of things is to grow much worse before it is better. Sooner or later a movement in favour of brotherly dealing within the brotherhood is inevitable. The direct rivalry amongst provincial men is in many towns said to be an exceedingly irksome burden; while in London there are complaints of petty jealousy not at all pleasant to hear. Human nature is human nature; but all the greater the need for little artificial virtues if the great natural vices cannot be otherwise corrected. We may frankly confess to a sly wish that there may be heard at some future conference of architects a good round debate upon the conventionalities of practice here and there, sparing nothing that is unworthy.

A discussion of the artistic novelties of the day might turn out to be a much more complicated and interesting exercise than many of us might be inclined to think. The ancillary arts architectural are many and varied, and it is doubtful whether they do not indeed occupy in the aggregate a larger space in the public view of artistic matters just now than all the varieties together which are in vogue of architecture proper. It is to be regretted, perhaps, that some architectural society of the more private and unostentatious order has not already been established for cultivating the higher harmonies of the constructive and decorative arts as a whole. The masters of the minor arts are no longer mere artificers, but gentlemen carrying a good education as well as a good coat, and we cannot believe that the old awkward exclusiveness of architects is beneficial any longer either to themselves or to the public. There is a notable difference in this respect between the Institute of Architects and the Institution of Civil Engineers; the one admitting all sorts of allies freely, and the other excluding all sorts with a morbid churlishness which carries us back to the days when an architect was as much afraid of being identified with trade as a pretty page of the backstairs might be.

Building novelties are too numerous to be touched upon lightly in the mass; but there are always a few of the choicest and most important of them which are well worth discussing, and it is a pity they are not discussed amongst architects—at the Institute, for example—much more than they are. We have had *ad nauseam* the investigation of what are euphemistically called sanitary appliances, hot-water works, chimney-cowls, cooking-ranges, and other inventions, some being more or less ingenious and useful; but it is surprising to specialists in many instances to observe how very backward many of our working architects seem to be in respect of the understanding and appreciation of really novel qualities of material, processes of workmanship, modes of constructive administration, and articles of modest advancement in the way of the miscellaneous paraphernalia of building. We are overwhelmed with showy lithographs and flooded with expensive circulars, but when do we ever consider seriously the actual progress they indicate?

The march of style in public architectural design is a

subject of the greatest importance to the casual practitioner and of the most pleasing interest to the critical observer. In architecture, more than in any other of the greater arts, there is always to be perceived, by those who can read the language, a certain course of progression, wayward and devious sometimes, and often uncertain and unsteady, but never otherwise than the intelligible effect of intelligible causes, the past producing the present, and the present pointing to the future with inevitable regularity. Ten years ago, who amongst the class of ordinary architectural operators could have supposed that they would all be working now so earnestly in such a mode as the Queen Anne? Ten years hence, what will the same men be working in? And yet it is all set down for them in the book of Fate, which unfolds itself so slowly to some and so swiftly to others. It is time that some effort were made to comprehend this, to work from knowledge and not impulse, and intelligently to prepare for to-morrow instead of dawdling away our short to-day without an object save daily bread, as so many do who are capable of better things.

### THE WATER-COLOUR SOCIETIES.

BOTH the Society and the Institute of Water-Colour Painters opened their summer exhibitions on Monday, and thirteen hundred and eighty-four fresh specimens of what some writers, with infirmity, call "the essentially English art" are placed on view for the season. How many more, submitted to the Council of the Institute, received the discouragement of rejection it boots not to particularise. Even the crudest exhibition goes sure by this time that acceptance and rejection in this or any other gallery does not make or mar a reputation or gauge a painter's merit. We all know too well that the profession of artist, like all professions, is over full; that the picture market, like other markets, is overstocked; also that the average excellence of production has reached a higher mark than in any former years, but that work of the highest quality is still rare. These are truisms in the economy of art, but they are forced upon one in noting, for instance, the aspect of the large galleries of the Water-Colour Institute, now an open exhibition, and mustering not far from eleven hundred pictures. The average are above mediocrity, and show ever increased freshness of observation, especially in the department of landscape genre, and distinctly advanced technical facility; but, on the other hand, we look in vain for any new strength in imaginative design or splendid colour gained by the extension of the space to outsiders. Both open and closed societies have their office; the first offer free field for the first appeal of talent, and encourage width of artistic range in style, subject, and thought; the function of the second is, or should be, to keep up the standard of recognised worth, while avoiding by all means the unworthy and stultifying vice of cliqueism. The elder Water-Colour Society certainly, in the exhibition now open, justifies its title to fulfil part of its mission, although, through some unaccountable elections made at different times, the even balance of high quality is still indeterminate.

In the Piccadilly galleries we find certain recently-chosen members of the Institute very notable. Mr. WALTER LANGLEY proves by his subject-picture, *Among the Missing—Scene in a Cornish Fishing Village* (275), that he can not only render with vivid reality and emphatic character a given model, but that he can use his models freely and with artistic command in the service of a dramatic motive. There has been a terrible storm at sea; the sky is still full of rain and wind, and fierce gusts blow about the post and telegraph house of the village on the coast, where the people have come down to gather news of the fishing fleet out in the gale. They can hardly stand on the soaking ground for the wind, some of them; but they hang about the place in their weary anxiety, unmindful of the fierce weather. One girl has heard bad news of husband or lover, and is led away by her old mother, hiding her face with her hands in an agony of sorrow that every line of her strong frame reveals. The whole scene is set forth with a pathetic reality, with such touches of suggestive facts as only a true artist knows how to select, and at the same time with a power of composition in the management of many figures and ingenious balance of parts for which one had hardly given Mr. LANGLEY credit. It is a thoroughly honest picture from beginning to end. The technical qualities are sound as the sentiment is true. This artist exhibits other studies, but this is his most important and also by far his best picture.

Mr. CLAUSEN shows his usual vigour in the poetic literalism—if one may call it so—of his scene of rustic labour, *Hoing Turnips* (610). He seems fond of showing how much may be made out of the simplest and least attractive of field-work incidents. Mr. HUSON has a very good landscape on the same lines: *Something Wrong* (628) has happened to the mowing-machine in a hayfield, and gives occasion to set the figures of the farm-people who guide or look on in picturesque attitudes. Mr. HUSON is a distinct and frank draughtsman and painter; perhaps he lacks depth of colour and effect. The American artist, Mr. ABBEY, has the narrative faculty, which is developed in the work of an illustrator—the skilled line, the careful chiaro-oscuro, also a certain lack of colour and inkiness of shadow. *Bible Reading* (1018) in the household of a Puritan settler gives scope for character and suggestive motive. Between the zealous minister, hot over his exhortation, and the girl whose leaning to the world and the flesh shows itself by a wandering eye and the little coquetry of daffodils stuck in her hair and her dress, the various characters of the domestic drama act as links in a well told story.

Certain foreign mannerisms mark the work of a group of artists otherwise unlike in power or style. The clever eastern scenes of ARTHUR MELVILLE, sketches rather than studies, remind us somewhat of the French M. BIDA. The charming little pastorals of M. CAFFIERI (220, 849), with a motive and feeling quite individual, are, in the blottesque prettiness of the execution, like a certain delightful phase in the work of M. HEILBUTH, without his artificiality. The tiny groups of quaint fisher-folk by M. L. MENPES (844) are technically curious, resembling soft ground etching translated into colour. LUDWIG PARSINI, a very useful member, is hailed as one of the clever group of artists who record modern Venetian life; *Passeggio* (927), a lagoon-side promenade, is most clever, sparkling, frivolous, and gay—modern Italy all over, only more learned in management than appears on the surface.

The Institute is most catholic in hospitality, as may be illustrated by contrasting the mediæval eccentricities of Mr. SPENSER STANHOPE, the nerveless semi-classic nudities of Mr. WALTER CRANE, and the third-hand Burne Jones-isms of Mr. R. ROSE, with the deftly-handled wit of Mr. FRANK DADD, the quaint and delicate last century retrospects of Mr. CALDICOTT, or the incisive character groups of Mr. GOW, A.R.A., who has been in Algiers, and sends a little clear study of *Spakis* (370), or Arab soldiers grouped in the white sunshine.

There is nothing fresh to be noted about landscape in the Institute exhibition. The elder Mr. HINE is true and tender as ever in his pictures of the Sussex downs. His son has painted a capital study of *The Floods out at Ely* (360). Mr. THOS. COLLIER paints with unabated freshness sketches of wild common-land and far-reaching distance under rainy skies. Mr. FULLYLOVE is more successful than ever in pleasant dreams of stately gardens, where fountains and statuary are fitting company, and Mr. ELGOOD follows suit. Mr. JOSEPH KNIGHT shows a large and impressive picture of evening glow over marsh lands and river, but his brush work is muzzy and wants character, and his colour relations are not true. We fancy that his touch has lost its way between the practice of the brush and the tools of a mezzotint engraver. Mr. HEMY has made a fresh start, and in a picture of sailors and sea-waves breaks into vigorous and crisp handling, quite unlike his old photographic solidity. Before leaving the gallery we should like to name the clever street scene at *Honfleur* by ARTHUR BELL, and an admirable little sketch of *Towers and Roofs at Rouen* by J. H. LORIMER, taken from a church tower. There is character and a quiet power of selection and omission in both which promise much.

We have said that the elder Water-Colour Society maintains its high position, and at no time has this been more noticeable than now. There is a maturity of style and completeness of work about the drawings in this exhibition which is in marked contrast with the heterogeneous character of the gathering in Piccadilly; of variety, too, an unusual degree. On the figure list we find such opposed excellencies as those of Mr. POYNTER, R.A., in a lovely and learned study of a girl with a violin, *Viola*, and a less admirable *Psyche*, over against the brilliant literalism of Mr. HENSHALL, painting a young girl posed, childlike, askew on a high library chair, holding a book that has set her brain busy with *Thoughts*. Mr. TADEMA, R.A., contributes an ugly Roman girl hanging a wreath up at a *Street Altar*, painted with usual masterly circumstance. Mr. HAAG appeals with certainty of response from a certain

audience in a showy treatment of the picturesque old Bible story of *Eleazar Returning from his Mission* with REBEKAH, the bride for his master's son. In the way of subject genre Mr. CHARLES GREGORY continues to show a ready invention of incident and vivid realism of character both in animate and inanimate nature; but his composition is too busy and disjointed, and there is an amount of glare about his fresh, imitative colouring. Several of his scenes are this year laid in the churchyards of pastoral England, and a chief picture depicts the story of a *Deserter*, alarmed in his happy rustic household by the passage up the village street of his old regiment. Mr. WATERLOW, a recently-elected member, seems inclined to forsake altogether the quiet charm of his early landscape manner, and breaks in *A Ramble on the Cliffs* into a brilliant, rather crude echo of Mr. HOOK's style and subject. Of landscape artists, with whom the figure is important as carrying out the sentiment of the scene, but subordinate in scale and place, Mr. NORTH and Mr. ALFRED FRIPP may be cited as chief. The exquisite drawing called *A Village by the Sea*, by Mr. FRIPP, is full of delicate truths, carried out with infinite pains from end to end of the subject, but kept in such unobtrusive balance as would blind the casual observer to the labour and knowledge involved. Anyone may, however, feel delight in the atmospheric quality of the pure, pale sunshine which suffuses the hill-side; the row of sailors' cottages, with figures chatting here and there; the cobble baskets drying on the grass, the cliff, and lustrous sea. Mr. NORTH has recovered all his charm and strength. The *Maid of the West Country* is as lovely an English idyll as one need desire. The landscapists and sea-painters are at their best this year, with the exception of Mr. ALBERT GOODWIN—Mr. GEORGE TRIPP in a masterly study of cliff on the *West Coast of Sark*, Mr. A. HUNT in a wild scene of sunset and storm clouds over a *Deserted River-bed*, Mr. RIGBY and Mr. THORNE WAITE and Mr. TOM LLOYD in various transcripts of upland and cornfields, Miss MONTALBA in sketchy but delightful reminiscences of Holland, Mr. HENRY MOORE on coast and sea, and finally Mr. FRANCIS POWELL in a large drawing of green dancing sea waves under a *Summer Breeze*, which is consummate in delicate accuracy of drawing of wave and sky and wonderful beauty of atmospheric effect. The drawing is steeped in sunshine, without a sharp contrast of light and dark anywhere, and the sense of space in the perspective levels of sea wave and the over-arching heaven, up which the soft summer clouds fleet, is a victory of interpretive art.

The last elected members are of very different calibre and style. Miss MARY FORSTER, in several drawings of French river scenery under hazy light of morning or noonday, shows refined and close observation and a finesse of execution that is in delicate accord. Mr. ALBERT MOORE contributes two tiny drawings, called respectively *An Alcove* and *An Open Book*, in which he drapes and surrounds with drapery recumbent female figures, for the sole purpose, after his wont, of working out subtle harmonies of tint and balance of lines. In both cases patterned stuffs are used and treated with marvellous skill. Of these two gems of decorative art we prefer the open-book, in which pale cherry colour and a patterned stuff of grey and white glimmers like silver into one another, and take touches of pale yellow and flesh tints into the deftly-poised harmony.

We have not made especial note of Mr. HODSON's capital architectural subjects, chiefly French street views, which are, however, very acceptable in the exhibition. The most striking work shown of this character is a study of a portion of a pier in the *Porch of the Duomo, at Lucca*, by Professor RUSKIN. This is a practical lesson in the mode of studying architectural detail, in its entirety of colour, texture, and form, which cannot be too highly praised; such a record of decorated shaft and bas-relief from the Professor's brush may atone for many a misleading utterance from his mouth.

#### EXHIBITION OF THE WORKS OF FRENCH STUDENTS IN ROME.

By A CORRESPONDENT.

THE exhibition of the works of those French students who have obtained the "Prix de Rome" is always looked forward to with a certain measure of interest. The art works of this year are not more than usually important, but the architectural drawings are exceedingly fine, fully maintaining

the very high standard of former years, if not surpassing it. Nothing could be, in fact, more complete and thorough, both in study and execution, than these excellent works.

M. BLAVETTE has made an exhaustive study of the Pantheon in ground plans and elevations, both as it exists and in restoration, together with the palestra and xystus recently exposed behind the temple. He gives a section of the former with a decorative painting, representing a port or quay with a temple and an altar of NEPTUNE. He has also made a beautiful drawing of an entablature restored, of this building, with dolphins, tridents, and shells in relief. M. GIRAULT has devoted himself to an analytic study of the Arch of TITUS, of which he has given a plan and sections, together with front and lateral elevations. It is surmounted by a bronze figure in a triumphal chariot. M. DEGLANE has detailed study with much care and finish an Ionic column of Pompeii. He has also a restoration of a column from the Temple of MARS the Avenger in the Forum of AUGUSTUS, and a copy of ceiling decoration from the Villa of Papa Giulio. M. ESQUIÉ has bestowed a most thorough and complete study on the so-called Temple of VESTA, which stands near the river. He has also worked out a sculptured garland of fruit and flowers from the Pantheon. All these drawings are executed with the greatest care and skill, exhaustive in study, and models of architectural scholarship.

A few words must suffice for the works of sculpture and painting. M. FAGEL has a charming portrait-bust of a young girl. He has also a relief of *Don Juan in Hell*, which would be better adapted for painting than sculpture. M. POPLIN has a statue, which he calls the *Song of Autumn*, which is rather mannered and theatrical. Perhaps the best work here in sculpture is *Moses* after having slain the Egyptian, by M. LABATUT, which is vigorous and well modelled. Of the paintings the most remarkable is that of M. FOURNIER—the *Son of the Gaul*. A Gaul lies stretched on a battle-field, with a flaming town or village in the background, exposed to a pitiless rain. His wife has thrown herself on the corpse, whilst his son—a youth with a firm and determined look of vengeance in his face—removes the sword from his father's dead hand. M. BRAMTOT's picture represents the departure of TOBIAS from home, his father and mother taking leave of him, whilst his angel-guide stands beside an ass prepared for the journey. One hardly knows what is gained by the exhibition of such slight works as the *Berenice* of M. DOUCET, taken from Poe's ghastly story. Clever as this artist is, there are not here evidences of power sufficient to justify his appearance on grounds so inconsiderable.

#### EXHIBITION OF BUILDING TRADES MATERIALS AND GAS APPARATUS AT BIRMINGHAM.

BINGLEY HALL, Birmingham, is at the present time occupied with the various appliances that help to make up a Building Trades Exhibition, being the third annual display of this character held there. The exhibition was originally promoted, and still remains, under the management of Mr. PHILIP SHRAPNEL, of the Agricultural Hall, whose experience in connection with exhibitions generally has rendered him a director in whom exhibitors can place full confidence. On the present occasion an exhibition of gas appliances for all purposes has been added, which has helped to cause a greatly increased interest to be taken in the undertaking. When, three years since, the first Building Exhibition was inaugurated such a display was an innovation in the Midland metropolis; but so successful was the venture that it was announced for repetition last year, and, having now reached its third birthday, may fairly be looked upon as having taken root in this district. It is now close upon six years since a Gas Exhibition was held in Birmingham, when the authorities gave up the Town Hall for the purpose; and this was one of the first of any importance held. The example was, however, quickly taken up by other towns, particularly those where the gas supply was in the hands of the authorities. And since then there is scarcely a town of any importance that has not indulged in a similar undertaking. Six years in this era of rapid progress is a long time, and in obtaining the assistance of the Birmingham Corporation in carrying out his design Mr. SHRAPNEL has added to the success of the exhibition generally. It was opened on Monday

last by the Mayor (Alderman Cook), supported by a large section of the corporate body, and members of the Gas Committee. After the opening ceremony, the Mayor, the members of the Gas Committee, and several other gentlemen were entertained at luncheon by Mr. SHRAPNEL. After the toast of the Queen had been honoured, Mr. SHRAPNEL proposed the health of the Mayor, and His Worship having responded, proposed the health of Mr. SHRAPNEL. He again spoke of the excellence of the exhibition, and expressed a hope that it would be successful. Mr. SHRAPNEL proposed the Gas Committee, and Councillor POLLOCK, in responding, also spoke of the interesting nature of the exhibition. During the day Messrs. SYNVER & GILMER'S band played a selection of music, and a large number of persons visited the exhibition, which will remain open until the 17th instant.

The rapid strides that gas has made during the last few years as a cooking and heating agent have brought about changes in a commercial aspect of considerable importance to the class of tradesmen embracing ironmongers, gas engineers, and hardware dealers, that in many places have caused "bad blood" to be generated between them and gas companies, or where the gas supply is controlled by the Corporation, with the "ruling powers" also. This has been caused by the gas authorities entering upon the domain of the tradesman and either selling, or letting on hire at a small annual rental, the gas apparatus that hitherto has been supplied to consumers by the local tradesmen. The Birmingham Gas Committee, in whose hands the supply has been for some years, have it appears been anxious to avoid interfering with private enterprise in the matter, and have hitherto held aloof from countenancing this kind of trade, but it is asserted that up to the present time not more than about fifty stoves per year have been sold by the trade. As this for a town like Birmingham and its large district is a very small number, the Gas Committee have serious thoughts of adopting the plan already taken up by many other towns in the direction we have named. Although we are averse to seeing corporate or local bodies entering the lists as competitors with the legitimate tradesman, if the latter cannot or will not dispose of appliances that are both useful and beneficial to a community, they have no right to complain if others more enterprising than themselves take the matter up. It is certain that there is a great demand for gas-stoves of all kinds. As they are of a character that requires no fixing beyond a connection with the nearest gas-pipe, they offer great advantages to a large body of people who are merely tenants, and who, if they can obtain the use of them on favourable terms, will adopt them either as an auxiliary to coal-grates or as a primary addition to their household. By the hire system, a trade that it is desirable to develop will be considerably fostered with its necessary corollaries, a large additional employment of labour.

The most attractive stand in the gas section, albeit it is devoted to lighting appliances only, is that of Messrs. GEORGE BRAY & Co., of Leeds. The name of this firm has recently become very popular in connection with street lighting. The original business in which Mr. BRAY was engaged was the manufacture of gas-burners, and in turning out these minute articles the fortunes of the firm have been mainly built up. Considering the length of time these little articles last, but few unacquainted with the demand would imagine that much money could be made by a firm who depended entirely upon them for their income; but Mr. BRAY has made the manufacture of gas-burners almost a science, and it is interesting to look through the many patterns, sizes, &c., that are made for different purposes and various markets. The demand for them is simply enormous. When a few years since a need became apparent for a better system of lighting our public thoroughfares, Mr. SUGG introduced street lamps with argand burners of the power of 500 and 1,000 candles. Mr. BRAY now turned his attention to the manufacture of street lamps of large illuminating power, but proceeded upon a different plan to his metropolitan competitor. His contention was that the argand burner was objectionable because it cast a great shadow underneath, that it must be accompanied by the long vertical chimney, requiring cleaning every day, and liable to breakage at any hour, and that it burnt an unnecessary amount of gas. By means of a specially-constructed lamp, he introduced a cluster of three, five, or even more (according to the amount of candle-power required) flat-flame burners, that is to say, similar ones to those used in our gaseliers at home. At a Gas Exhibition held at Leeds these lamps

were pitted against those with argand burners, and in the large open space outside the Town Hall the "battle of the street lamps" may be said to have been fought out, and in our opinion the argand burner for street lighting purposes received its death-blow, for although for a time they retained a certain position, they have in the main given way to the flat flame burner, which is generally adopted by the few firms who cater for street-lighting lamps. The flat flame lamps cast no shadow, require no chimnies, have on the whole a more pleasing appearance, and we believe burn less gas. Then came the great excitement connected with the inroad of electric lighting, and gas engineers found they had a competitor to deal with that required all their talent and ingenuity to battle with. But, nothing daunted, Mr. BRAY sought the foe wherever he was to be found, and fearlessly threw down the gauntlet, showing himself a foeman worthy of their steel. On two occasions we are acquainted with he obtained a signal success over them. On the occasion of the meeting of the British Association at York in 1881, the Corporation of that city, who were desirous to improve their street-lighting, invited a competition between gas and the electric light, to enable them to come to a conclusion. Without entering into the details of this competition, which was entered into by Mr. BRAY with his improved gas-lamps and the BRUSH COMPANY with their electric light, the gas was considered to effect the purpose best, both as regards the steadiness and more equal diffusion of light, while the cost was considerably in its favour. Later on in the same year, at a Gas Exhibition held at Aberdeen, at which the SWAN incandescent lamps played a conspicuous part, Mr. BRAY solicited the authorities to allow a competition between gas and electricity in the lighting of the hall in which the exhibition was held. Here, again, gas scored a decided triumph; so that with both "Arc" and incandescent lamps BRAY & Co. proved themselves equal to the occasion. We are prepared to make all allowances for the incomplete state of the electric lighting industry at that time, but we allude to the matter more to show the pertinacity of one firm; and if electric lighting becomes general in future, electricians will find this firm opposing them inch by inch; and if they are to collapse they will die hard. The various lanterns manufactured by the firm are exhibited here, including a special pattern designed by Mr. CHARLES HUNT, gas engineer to the Birmingham Corporation, and used in their principal public thoroughfares, called the Birmingham pattern globe lantern, of 100 candle-power, a pretty colonnade lamp of 80 candle-power, and a patent works lantern of the same power, designed especially for manufactories—all made on the firm's patent principle; and a mammoth lantern named BRAY'S 2,000 candle-power cluster, constructed on Mr. GEO. BRAY'S mode of grouping flat-flame burners invented by him in 1879. Several of the special burners made by the firm are shown alight, in connection with a choice selection of globes and shades, for the purpose of illustrating the different effects produced in gas lighting by the peculiar make of a burner, and the exhibit as a whole is of a most interesting character.

In heating and cooking gas-stoves the greatest novelty exhibited emanates from Messrs. BEYNON & COX, of the Torbay Iron Works, Torquay, whose patented principle of heating by gas, without allowing its presence in the oven or cooking-chamber, appeals to the prejudices of those who have hitherto been averse to use gas for cooking purposes from a fear of taint pervading the viands. Without stopping to discuss this question, there is no doubt the firm have accomplished much by their invention. The gas-burners in an ordinary-sized cooker amount only to four of the ordinary character, and only two of these are necessary in some instances. They are burnt in a metal chimney or furnace, and from thence the heat is carried around the oven similar to that in a coal-fire range. From thence it arrives at the top to a super-heating chamber, where the products are mainly destroyed by the intense heat, and the residue, instead of being allowed to escape at an outlet close to the top of the stove, has to travel down a tube to nearly the bottom, by which time the heat-giving powers are quite exhausted, and leave the stove at a comparative low temperature. The tops of these stoves are fitted with the usual boiling arrangements, and a more perfect and innocuous cooking-stove it would be difficult to procure. Admirably arranged stoves of a most compact character, including boiling and steaming appliances, by which a dinner, including pastry, may be cooked for a dozen persons, and of a size so small that were we not certain of the fact we should

scarcely feel justified in announcing it, are also shown, and grills intended for "early train" breakfasts, boiling the kettle and cooking bacon, chops, &c., at the same time, large enough also for materfamilias, if the family is small, having her luncheon cooked at the appointed time, including roast and boiled with vegetables. The heating and ventilating stoves made by this firm, and based upon a somewhat similar arrangement, have secured a large amount of public favour. We append an illustration of one in elevation, and the principle

may be described as follows:—The burners are the same as in the cooking-stove, and the heat circulates through the entire area of the body, with the exception of a space occupied by a series of tubes about one and a quarter inches diameter, which are fixed in the centre. An opening near the bottom of the stove is provided to receive fresh air from the outer atmosphere. This must be effected by carrying a pipe from the nearest opening. The air, on entering, is received in a chamber at the lower part, where it becomes heated. It then passes up the tubes before mentioned, all of which are in a highly heated state by being fixed in the centre of the chamber in which the heated gas is present, and is discharged into the building at a genially heated temperature. In the stove illustrated as much as 5,000 cubic feet of fresh warmed air is emitted per hour. At the Smoke Abatement Exhibition both the heating and cooking stoves received silver medals, the highest awards granted in their classes; and in a special cooking test, wherein it was sought to gauge the value of differently constructed gas-stoves as to their effect upon meat cooked in them, the joint roasted in Messrs. BEYNON & COX'S stove was found to be fresh long after some of the others had ceased to be eatable. At the International Health Exhibition the firm will exhibit a baker's oven on the same principle as their cooking-stoves, in which bread will be daily baked, and, we are assured, at a cost considerably less than by the present system of heating by coal or coke.

In addition to the above, a gas-engine, which is calculated to make a mark amongst the many now in existence, is also exhibited. We append a sketch of it. A glance will show the working parts to be as simple as possible consistent with efficiency, while the absence of cog-wheels and similar complications reduces its liability to get out of order to a minimum, and friction may be said to be unknown. All the work is accomplished by a single piston valve operated on by a simple cam, which, instead of wire-drawing the charge, instantaneously opens and as instantaneously closes the port through which the

explosive mixture is injected, thus insuring a full charge. Another very important quality in this engine, and not possessed by many small-power engines, is its very regular motion, a desirable attainment for most purposes, but absolutely essential for the generation of electricity. This result is brought about by an explosion being made to take place at every revolution, instead

of only once in two or three revolutions. This clearly shows that in the former case the force of each revolution is thoroughly uniform, whereas, in the latter, it is obvious that it will be alternately weak and strong. There is never any difficulty in starting the WITHERS' engine, which can be set going at any time in ten seconds, while from its extreme simplicity it can be taken to pieces for cleaning, and put together again by any labourer in a quarter of an hour.

Messrs. J. WRIGHT & Co. send an assortment of their numerous pattern stoves, comprising boiling, laundry, tailor's, cooking, heating, and other varieties. Messrs. ARDEN, HILL & Co., of Constitution Hill, are another firm who make a large and comprehensive display, while less cannot be said of the collection brought together by Messrs. SIDDAWAY & SONS, West Bromwich.

Gas-engines are also shown by Messrs. CROSSLEY BROS., Messrs. J. E. H. ANDREW & Co., Messrs. PIERCY & Co., and other local firms; while last, but not least, in this division must be mentioned the DOWSON ECONOMICAL GAS COMPANY, Limited, 3 Great Queen Street, Westminster, S.W. The object of this company in producing the apparatus patented by them is to provide a gas for industrial purposes, such as driving gas-engines, heating, cooking, &c., at a cost considerably less than ordinary coal-gas. So effectively do they attain this object that the testing engineer of the Smoke Abatement Exhibition certified that there was a saving of 50 per cent. by using Dowson gas. Improved meters, regulators, burners, and other minor fittings, complete the exhibits in this class.

Building stone is not altogether absent from the exhibition, and it is satisfactory to note that what is shown is of no common quality, and so far compensates for the lack of quantity of exhibitors in this section. We refer especially to the sample sent by Messrs. STONE BROS., Bath, which comprises the following varieties:—Coombe Down, a good weather stone of light colour, free from soft yellow beds, and one that may be used with safety at any season of the year, however exposed the situation may be, and will always look well. Box ground is another fine weather stone, but of a warmer tint. Stoke ground is regular in texture and may be advantageously used either for external or inside work, and from its depth of bed, which reaches 6 feet, is also very economical. Farleigh Down is much softer than the other kind, and is generally of a rich yellow tinge, but a variety known as the "brown" or "red bed" may also be had—it is not recommended for external plinths, string courses, copings, &c. Corsham Down is a similar stone to the latter, but not so soft, and of a very light colour, which gives it a most effective

appearance. Lastly comes the variety known as Corn-grit, which is a very strong stone especially adapted for bearing great strains.

Messrs. STONE BROS. send a considerable quantity of their different varieties to Birmingham; and amongst other buildings for which it has been used may be mentioned the General Post Office, the Great Western Arcade, the New Arcade in Corporation Street, the Stork Hotel, the new Hagley Road chapel, a new church in Icknield Port Road, and many others of less public importance. They have also supplied upwards of 80,000 cubic feet for Baron ROTHSCHILD'S new mansion at Halton, recently completed by Messrs. CUBITT & CO.

The well-known Staffordshire blue bricks and kindred articles also made from the almost adamant material are well displayed by Messrs. WOOD & IVERY, Limited, Albion Blue Brick and Tile Works, West Bromwich. The varieties of kerbings and pavings so largely and advantageously used in the district are shown in several patterns. Finials, copings, string-courses, and other architectural dressings make a goodly show, and the quarries, garden tiles, and minor articles acquit themselves to advantage, leaving little to be desired as regards either finish or design.

Messrs. HARRIS & PEARSON, Stourbridge, have a very useful exhibit of fire-clay goods, glazed bricks and tiles, Staffordshire bricks, sanitary pipes, and allied appliances. It is for the first-named class of goods that the firm have secured so excellent a reputation, and for gas retorts, glass-house pots, crucibles, and other vessels requiring to withstand intense heats their quality cannot be excelled. The firm are also patentees of boiler seating-blocks, flue covers, and bricks with studs for covering upper surfaces of boilers. The last possess important features, conspicuous among which is that they form a hot-air chamber over the boiler, and are a most reliable non-conducting and weatherproof protection; they are equally indestructible, and are at once safe and neat. The saving of fuel is consequently considerable, and is estimated by Messrs. HARRIS & PEARSON at one-third. Another firm who help to swell the exhibits of building material proper is Messrs. JOSEPH KING & CO., of Netherend and Cradley Park Collieries, and Blue Brick Works, Stourbridge. Like other firms in the district, one of the largest branches of their business is the Staffordshire blue brick, and besides the common stocks, quarries, tiles, &c., they show it as a facing brick in some well-designed ornamental and moulded patterns. White facing bricks, glazed bricks, red and buff terra-cotta work, string courses, terra-cotta vases, &c., are also displayed in considerable variety, the finish and design of which do the firm great credit.

Considering that Birmingham is the very home and centre of the brassfounding industry, the entries are certainly meagre in this division; though, as we have remarked in speaking of other classes, what is shown is of excellent quality and such as will demonstrate to the uninitiated that this branch of manufactures still exists in the Midland metropolis, and that the infinite variety of purposes, both useful and ornamental, for which brass work is used, has by no means diminished.

Messrs. WILLIAMS BROS. & CO., brassfounders and tube manufacturers, Pershore Street, Birmingham, have admirably exemplified this fact, and their stand may be studied by any one with great benefit. It consists of a square glass case constructed with metallic sash bars and with brass pillars at the corners, as used in high-class shop fronts. Each side is very tastefully fitted with an assortment of the different branches of their business. In one are shown brass, brass cased, copper, steel, and iron tubes, in plain, taper, twisted, and fancy ornamental patterns, such as are used in the manufacture of bedsteads, chandeliers, &c. In another are to be seen a variety of stair-rods, picture-rods, brass beading, railings for pews, desks, &c.; in the others are respectively door pulls and door furniture, and all kinds of window fittings and fancy brassfoundry for cabinet-makers, house and church decoration, shipwork, &c.

Mr. C. CARR, bellfounder, the Woodlands Bell and Brass Foundry, Grove Lane, Smethwick, sends a very fair collection of goods, which are, though, of a heavier class than those referred to above, and comprise bells, stair-treads, mill brasses, &c. They also show a variety of articles made of the alloy known as phosphor bronze, a metal that is daily coming more and more into favour. Mr. CARR exhibits specially-constructed crucible melting furnaces for gold, silver, gun-metal, &c., that are said to possess very unique advantages.

Mr. ALEXANDER DICK, of Cannon Street, E.C., is present with samples of his celebrated "Delta" metal, the salient features of which we have pointed out on other occasions in our columns.

Mr. R. RENTON GIBBS, Mill Street, Liverpool, whose patent boilers and hot-water apparatus have gained considerable notoriety, occupies a prominent position near the entrance; and his stand being situated at the end of a row, and facing the avenue on either side as well, enables the articles to be seen to the very best advantage. The Renton-Gibbs patent boiler, set in brickwork, is shown in several sizes, for heating different quantities of hot-water piping. It is very easily managed, and the required heat is soon attained by a minimum consumption of fuel; it is consequently very economical, and is much sought after; so are his patent iron furnaces, which possess equally salient features, and are likewise made in a number of sizes.

Messrs. J. L. BACON & CO., of 34 Upper Gloucester Place, Dorset Square, N.W., also have an interesting exhibit of hot-water heating apparatus. The special, and we may say really unique, features of their system have lately been pointed out in these columns. Our readers are, therefore, familiar with it, but we may mention that the firm were the first to introduce a specially-sized wrought-iron tube for hot-water heating, which has proved to be of such exceptional merit that scarcely anything else is now used, and other makers have readily adopted it. The finish and design of the ornamental coil cases, skirting cases, &c., &c., are quite up to their usual standard.

The BIRMINGHAM SANITARY ASSOCIATION, 28 Upper Priory, make the most important show of sanitary appliances. The chief articles of interest at their stand are:—BOYLE'S self-acting air-pump ventilators, BOYLE'S patent chimney-cowls, BOYLE'S patent smoke-extractor, and a number of the other well-known inventions of Messrs. BOYLE, for which this firm are the district agents; POTT'S patent Edinburgh air-chambered sewer and soil-pipe traps in a variety of sizes; MAIGNEN'S patent Filtre Rapide, and BARRACLOUGH'S patent syphon water-waste preventer. Baths, lavatories, disinfecting apparatus, and a good general assortment of fittings and minor sanitary accessories make this a very complete and attractive exhibit.

In artificial stone, the VICTORIA STONE COMPANY, 283A Kingsland Road, N., carry off the palm, and have sent a representative collection, comprising specimens of paving, railway platform coping, vases, sills, &c.

The BLACKMAN AIR-PROPELLER VENTILATING COMPANY, LIMITED, 57 Fore Street, are the representatives of mechanical means for ventilation, and their appliances, of which we explained the principles in a report upon the late exhibition at Islington, appears to give much interest here, where it is being exhibited for the first time.

The patent metallic and other Venetian blinds, the very artistic festoon and spring-roller blinds, the steel and iron shutters, and school furniture, manufactured by Messrs. HODKINSON & CLARKE, of Small Heath, that recently figured so prominently at the Agricultural Hall, are again shown in all their variety, and are, we understand, to be forwarded to the Health Exhibition, where, it is only fair to say, they will form a very attractive and legitimate feature.

Mr. WM. FISHER, 53 Paradise Street, West Bromwich, and the MIDLAND EDUCATIONAL COMPANY, of New Street, Birmingham, also exhibit very good assortments of school furniture, consisting of improved teacher's desks, seats with reversible back and hat-rail underneath, diagrams, and a variety of the most improved educational appliances.

Mr. HY. BASSANT, 18 Wells Mews, Wells Street, Oxford Street, W., sends his usual creditable display of parquet flooring and borders. Some very choice specimens of teak are among the most noteworthy features on this occasion.

Mosaic decoration, alike for floors, dados, hearths, &c., is contributed by Messrs. DIESPEKER & CO., 40 Holborn Viaduct, E.C., the artistic merit of whose work has lately been the subject of comment in our columns, so that any lengthy remarks would now be superfluous. At the time of our visit their stand was not complete, but according to the description they have entered in the catalogue, their display bids fair to be equal to the one they made at the Building Exhibition at Islington.

Messrs. THOMAS ADAMS & CO., Gloucester and Birmingham, also make a fair show of mosaic work for floors and hearths; and it is satisfactory to note that the furniture con-

tributed by the BIRMINGHAM FURNISHING COMPANY, Colmore Row, is of excellent and original design, and materially adds to the artistic character of the exhibition.

### PARIS NOTES.

ONE of the most curious old buildings in Normandy, the Hôtel du Grand Cerf at Les Andelys-on-the-Seine, is about to be sold. This ancient inn is almost a museum in itself, with its antique cabinet, old crockery ware, enormous wrought-iron kitchen fire-dogs (unique of their kind), and curiosities of every sort. The house formerly gave frequent hospitality to the Primates of Normandy. Antoine de Bourbon, father of Henri IV., died there in 1562 of wounds received at the siege of Rouen. In the last century the house bore the sign of the Fleur de Lys, which was changed at the time of the Revolution for that of Le Grand Cerf. The front of the building dates from the fifteenth century; the panels of the interior staircase are covered with exquisite drawings; in the dining-hall the rafters and wainscoting bear the salamander, the arms of Francis I.; and the vast chimney in the same room is decorated with a sculptured frieze, in which children and animals of fantastic shapes are sporting. Le Grand Cerf is, in fact, one of the show places of Normandy, and has been visited by celebrities of all kinds. Walter Scott in 1827 and Victor Hugo twenty years later made a stay in the curious old inn.

The magnificent Gallo-Roman remains discovered four or five years ago at Sanxay, by the Père de Ste.-Croix, which are especially valuable from the considerable light they throw on the civilisation of the period to which they belong, are likely to be lost to archaeological science, unless prompt action be taken to save them. Three principal buildings were brought to light during the excavations, viz., a temple, theatre, and baths, all of them presenting peculiar arrangements. These finds have, moreover, shown exactly how the great meeting-places were fitted up for the temporary accommodation of the public, on occasion. In order to preserve the valuable ruins, M. Léon Palustre, Director of the French Archaeological Society for the Preservation of Historic Monuments, at Tours, in the department of the Indre-et-Loire, makes an appeal for public subscriptions, with a view to the purchase of the ground and the erection of the necessary buildings to shelter the remains.

The Managing Committee of the group of Independent Artists, consisting chiefly of those whose works have been refused by the Salon juries, have received a letter from M. Stupfler, one of the City of Paris architects, announcing that some of the buildings in the Place du Carrousel will be placed at their disposal free of charge. It has been decided that the exhibition of their works shall open on the 15th inst.

The Association of Painters, Sculptors, Engravers, and Designers, founded by the late Baron Taylor, held its 30th annual meeting on Saturday last, under the presidency of M. du Sommerard, member of the Institute. During the past year 270 new members have joined the Association, and its annual income, which amounted to only 34,000 frs. in 1872, is now considerably more than double that sum.

Preparations are at present being made at Rouen for a National Exhibition of Retrospective Art, under the direction of MM. Alfred Darcel and Andrien de Germiny. The exhibition is projected to last four months, and will include antiquities, paintings, furniture, and works of art of every description appertaining to the Middle Ages, the Renaissance, and the eighteenth century. It will be opened on June 1.

The ten competitors for the Grand Prix de Rome in painting were locked up last week in their respective *loges* at the Ecole des Beaux-Arts, where they have to remain for a period of seventy-two days. The choice of subject for the final competition was entrusted by the Academy of Fine Arts to M. Cabanel, who gave the following:—Lucretia having stabbed herself to death, Brutus withdraws the dagger from the wound, and, holding it up, exclaims, "I swear, and take you for witnesses, oh gods! to extirpate by all means in my power Tarquin and his race, and to suffer no more kings in

Rome!" Collatinus, the husband of Lucretia, Lucretius, her father, and Valerius Publicola are to be depicted as repeating Brutus's oath, and passing suddenly from grief to a passionate desire for vengeance. The result will be declared on Saturday, July 26.

The Committee for the erection of a statue to the late General Chanzy have collected 133,000 frs., including a contribution of 10,000 frs. received from the Department of Fine Arts. The subscription is now closed. It has been decided to erect the statue at Le Mans, the scene of Chanzy's hardest-fought battle towards the close of the Franco-German war.

A number of additions have been recently made to the collection relating to the history of Paris in the Museum at the Hôtel Carnavalet. Among them are some curious sketches by Prudhon, David, and Bailly; pictures of *The Justice of the People pursuing Despotism*, and the *Apotheosis of Marat*; portraits of Robespierre, Mirabeau, Lepelletier, St. Fargeau, and Hoche.

A large covered market is to be built on the outskirts of the new fashionable quarter of Paris, the Plaine Monceau. Two new streets will be made in connection therewith—one starting from the Boulevard Pereire to join the Avenue Wagram, and the other branching off from the first and isolating the southern side of the new market.

A statue to Antoine Watteau, the painter, is to be unveiled at Valenciennes, his native town, on October 10 next. The effigy of the master is being executed by M. Carpeaux, and is destined to surmount a public fountain, the work of M. Hiolle, on the Place Carpeaux. The date chosen for the inauguration corresponds with the bicentenary of Watteau's birth in 1684.

Wood-paving is being most extensively adopted in the French capital. The Municipal Council has just approved plans for laying it down in nineteen more great thoroughfares:—The Rues des Tuileries, de la Paix, de Castiglione, de Médicis, and de Bourgogne; the Boulevards du Palais, Saint-Germain, Saint-Michel, Hausmann, Malesherbes; the Avenues des Gobelins, Friedland, Marigny, d'Antin, and Montaigne; the Places Vendôme, de l'Opéra, de la Concorde, and the Quai d'Orsay.

### METROPOLITAN WATER SUPPLY.

THE following communication from Mr. A. Le Grand, of the Magdala Works, 100 Bunhill Row, E.C., is in reference to a paper by Dr. Percy Frankland, which was read at the Society of Arts:—

From what has transpired in the course of the discussion upon Dr. Frankland's important paper, it would almost appear as though some hold it a condition precedent that water should, as a preliminary stage, be diluted with sewage in order to be subsequently purified by either natural or artificial processes, while others consider that nothing but deep well water is safe to drink; but from whatever source it may be obtained, the common sense desire must be to keep all possible pollution away from it; in other words, if we are compelled to travel along a dangerous road, instead of trying to see how near we can drive to precipices with safety, we should give them the widest berth possible.

I happen to have sunk some hundreds of tube-wells along the banks of the Thames, between Windsor and Gravesend, and have thus become acquainted with the water obtained. Many people are under the impression that because a well is sunk near a river the water drawn from it must of necessity come from the river; whereas, under certain commonly existing conditions, such as a porous subsoil in communication with the adjacent higher ground, the conclusion arrived at is erroneous.

I have met with numerous instances where the present water has been obtained at no great depth, close alongside the Thames, the foulness of which latter as it flowed by needing no analysis to prove it. The fact is, instead of the river supplying the wells in question, the very converse of this frequently is taking place, springs from higher elevations flowing steadily into the river, and thus, in sinking the wells in question, you are simply intercepting the springs which go to swell the volume of the river. I would, therefore, here remark that the analyses of samples of water drawn from the river at various points may lead to erroneous conclusions, if any of the samples in question happen to be taken at spots where these unseen tributaries of pure water are flowing with considerable strength into the river, and thus largely diluting its foul water.

The foregoing facts further point out that, if we are obliged to take the bulk of the London water supply from river sources, it would be far better to intercept the clean underground springs flowing into the Thames, than to take the water after it has been mixed with the many pollutions to which the stream is so liable. The adoption of such a course, while not only securing greater initial purity, would largely, if not entirely, do away with the work of filtration. An experiment in this direction was made upon a somewhat large scale about two years since, at Shrewsbury, where the river is polluted and turbid. Fifteen 3-inch tube-wells, about 22 feet deep, were driven upon a small island, which is at times covered with water; these were connected to one receiver, or main, about a hundred yards long, and yielded a supply of about three-quarters of a million gallons per diem. The quality of this water was rather harder than that of the river, but otherwise it was not only perfectly clear but remarkably pure.

Referring to the theory of purification by atmospheric influence, the following circumstance, which came under my notice a few years back, may be of interest as bearing upon the subject. The water from a more or less polluted river formed the supply of an important town in the north of England, and samples drawn direct from the stream were from time to time sent up to London to be tested by a well-known analyst, so that he was quite familiar with its characteristics. Upon one occasion the engineer caused the water, as drawn from the river, to be forced up into the air in a jet, and falling in a spray was caught and a bottle of it sent up to the analyst. So great was the change effected by this simple process in the direction of purity, that the analyst was with difficulty convinced there had not been a mistake made as to the source from whence the sample was derived.

Dr. Frankland mentions the deep well-water supplies of several towns near the river, and I must say, from my experience of a large number of artesian tube-wells I have sunk in the London basin, ranging from 150 feet to nearly 500 feet deep, the water so obtained is extremely pure and wholesome, and there can be no doubt whatever that such sources (where proper care is taken to exclude surface drainage, to which dug wells are liable) are the most reliable for purity; still, as the case of Ballard *v.* Tomlinson goes to show, ignorance or carelessness may jeopardise such a source, though incidentally I may observe, from an intimate acquaintance with all the facts of this particular case, they have perhaps been magnified much beyond its actual merits; not so, however, with regard to its bearing upon the whole question of the pollution of underground sources of water, which is a subject that unquestionably demands the urgent attention of sanitarians with a view to effective legislation.

It may hardly be generally realised, but it is none the less certain, that deep cesspools are daily being sunk, as the readiest, but none the less most improper, means of getting rid of sewage, not only for isolated dwellings but in populous districts. In some cases these cesspools are dug 50 feet or 60 feet deep, and in others borings are actually made to considerably greater depths for the same object, and I have more than once drawn the attention of the Local Government Board to this practice, which is fraught with much danger to the community at large.

### WOODEN WALLS.

THE traveller who comes from some other county into Hampshire, if he has an eye for traces and survivals of Old England, will, says a correspondent of the *Guardian*, frequently be reminded of the fact that this county has a great claim to be regarded as the original nursery and seed-plot of the nation. When the little nation of Wessex had grown compact on this limited area it soon found that it had an open field of expansion westward among the Weal-kyn, and early began to send out colonies which called themselves Wil-sets, Dor-sets, Sumer-sets. So the nation of Wessex gathered strength and experience, and when the time of trial came it proved to be the only power in England capable of checking the Scandinavian hosts, and of bringing the whole island under one united Government. If we listen to the dialect of the Hampshire folk, we hear a vocalism that asserts the original home of whatever has struck our ear as most salient and characteristic in the tones of Somersetshire, Devonshire, and Cornwall. The names of the places are rich in Saxon elements, and these sometimes hold in fixed combination some British word little found in later English settlements, as in Candever, Micheldever. As the eye examines the landscape we are often struck with the unusual number of yew-trees and their unusual situations. In the country at large yew-trees occur almost exclusively in churchyards; but in Hampshire we find them standing at intervals in the hedgerows of the fields. Their sentinel aspect harmonises well with the reminiscence of ancient boundaries and perambulations (especially of lands owned by the old monastery at Winchester), in which the yew-tree repeatedly occurs as a landmark.

But it is chiefly by certain homely forms of architecture that the early days of our history are recalled among the farmsteads and villages of Hampshire. Farm-buildings and outhouses are still frequently of timber—at least, such is the case on the west

side of the county, in the vale of the Test. Intermixed with some recent structures in brick may be seen ranges of sheds or barns with walls of boards, like the sides of a clinker-built ship. These are, in fact, the original "wooden walls" of Old England, from which the phrase was borrowed as a figure for the floating bulwarks of the navy. In this use it has now served out its time, and discharged its function; but still the original wooden walls are extant, and capable of being recognised. And this sort of building is not altogether confined to the inferior uses already mentioned; there are some highly interesting survivals of it in church architecture. It is possible that our ancestors may have been acquainted with this form of building in their old Continental mother country, but it is hardly likely to have been in general use among them there. The primitive contrivances of wattle and cob would most likely have been their ordinary practice. The more skilful timber architecture they would have learnt in this island from the Romanised Britons. The examination of Roman sites like that of Silchester shows us, that the Roman cities in Britain were of timber, with a low ground wall to rest the framing upon. There were exceptions in favoured localities such as Aquæ Solis (Bath); but the above seems to have been the established local usage which was handed on to the Saxon.

The highest development of this timber architecture was evoked by the fervour of our early Christianity. In the seventh century church building was pushed forward very zealously; and by the tenth century the land was filled with churches almost as thickly as at any subsequent period until the present century, and those churches were for the most part of timber. There were, indeed, certain rare and distinguished examples of stone churches; and these, if inquired into, will be found to belong either to the seventh century (or little after) on the one side, or to the eleventh century on the other. In the seventh century Benedict Biscop fetched masons from Gallia to build his two churches of Wearmouth and Jarrow. These did not stand quite alone; the same hands were employed on other like work elsewhere, and a period of stone church building was the natural result. But its duration was brief, and the art did not take root in the country at that time. It is to this period that the Saxon church at Bradford-on-Avon, to be mentioned presently, has, with good evidence, been assigned. When, after three hundred years, Cnut in 1020 gave orders to build a church at Assandun in Essex, the field of his victory, one of the vernacular chronicles specifies, as a memorable thing, that he ordered a church to be built of stone and lime. These exceptional cases only illustrate the fact that the general church architecture was of timber. It naturally resulted that a form of building which was in general use for several centuries developed some capabilities of being rendered graceful. Extant examples of wooden church architecture show a curious diversity in dealing with the material. At Greensted, near Ongar (Essex), the walls are formed of split trunks of oak-trees, which stand upright, morticed into the sill at the bottom, and let into a groove in the wall-plate at the top. Tongues of oak are let in between the uprights, so as to make the whole firm and weather-tight (P. W. Ray, "History of Greensted Church"). Sometimes the walls are made in large or small panels. The church of Besford (Worcestershire) is quoted as an example of the former, and the south wall of the chancel at Springfield, near Chelmsford, of the latter. In Hampshire there is at Michelmersh, near Romsey, a tower of oak adjoining a stone church of Perpendicular style. This tower corresponds to the description of Blackmore tower in Essex, being built of rudely squared timber of large dimensions, strongly braced together and covered with boards. The weathering of the oak boarding indicates age; but whatever be the actual date of Michelmersh tower, it must be held to represent the tradition of Saxon times. In the neighbourhood of Michelmersh may be seen also some minor traces of the same ancient work. At Timsbury and at Mottisfont are short half-towers or belfries which rise out of the roof at the western extreme of the nave. Such belfries spring from two of the walls of the nave, and they receive their supplementary support from a sub-structure within the church. Occasional examples of this construction may be seen in many parts of the country; instances are Drayton in Oxfordshire, Chipping Ongar, Stanford Rivers, and several others in Essex.

Our data for the timber architecture of Saxon times are not limited to the surviving specimens which are still in the same material. Almost all our extant relics of Saxon architecture in stone betray the hand of builders who were more conversant with timber. The wooden belfries above described may be seen here and there in stone instead of timber. One such is at Swanswick, near Bath, and another in a small country church two or three miles out of Knaresborough. These have long been puzzles to the lovers of church architecture; but the explanation is found in the fact that they are simply traditions of timber translated into stone. It is the masonry of the carpenter. And we may say generally that almost every feature which is known as "Saxon" in our old stone churches is characterised by its timber extraction. The "longs and shorts" to be seen in the quoins of Saxon towers, as in Bennet Church at Cambridge, or in the jambs of Saxon doorways, as at Laughton, in Yorkshire, are to be explained as alternations of wooden uprights and bonding-pieces. The feature which is considered the best proof that a tower is of Saxon date is a belfry

window with a certain peculiar baluster-shaft between the two lights. This baluster-shaft is a work of the lathe, and at first it was turned out of a block of wood. At Bradford-on-Avon there is an entire stone church of the early Saxon times, which has been cleared and recovered from the domestic buildings that crowded and concealed it, by the patient and loving energy of Canon Jones, the vicar of the parish. It is remarkably well built for the time, and probably not without the aid of foreign masons; yet even this fabric reminds us of timber. The Romanesque model from which the builders worked had shallow arcades in the face of the south wall; these have been executed by the craft of the carpenter rather than of the mason. The wall was at first raised with a fair ashlar front, and then the arcades were carved out of the surface, just as any boy who cuts a ship out of a log of deal sinks its upper surface to imitate a deck and bulwarks.

### THE FORTH BRIDGE.

THE following is the fourth quarterly report of the inspection by Major-General Hutchinson, R.E., and Major Marindin, R.E., of the works in progress for the construction of the bridge over the River Forth:—

Steady progress has been made since our last inspection in December. We somewhat deferred the date of the present inspection in order that we might be able to view the excavation for the foundation of the south cantilever pier, the bottom of which excavation has just been reached. The following is a brief description of the present state of the works:—

#### Temporary Works.

*At South Queensferry.*—The most important works consist of the coffer-dams for the south cantilever pier and for No. 7 viaduct pier. The former is composed of two rows of 12-inch sheet piling, with outside struts bearing against the piles, and sustained internally by heavy cross timbers. The dam measures 115 feet by 65 feet inside, and the piles, which average 47 feet long, are driven about 21 feet into the ground. With a view to safety and expedition, the dam has been divided into two halves. The eastern half is completed, the water pumped out, and a trial pit sunk in the centre to ascertain the depth of the hard clay at a depth of 9 feet below the surface and 12 feet below L.W.O.S.T. A compact layer of boulders, averaging 18 inches thick, was reached, and immediately below this the hard boulder clay was entered, which appears to be very stiff and compact. The piles of the western half of the dam are nearly all driven, and it is expected that the water will shortly be pumped out and the excavation commenced. The coffer-dam for No. 7 viaduct pier (the next but two to the south cantilever pier) is being constructed as a half-tide dam; all the timber-work is finished, and the clay puddling is being proceeded with, so that the excavation will be immediately commenced. In the shops and tube roads one of the mandrills has been increased in length to 45 feet to allow of a greater length of tube being drilled without removing the finished plates. Two five-drill travelling machines have been commenced, to drill the box lattice girders which connect the main piers from east to west. One temporary caisson, 61½ feet in diameter and 20 feet in height, is completed, and a second is nearly ready for erection. The Queensferry stage has been carried out to the centre of the main pier, a total length of 1,990 feet, and a T head is now in progress. Jetties have also been erected alongside the coffer-dams of the cantilever pier and No. 7 pier.

*At Inchgarvie.*—A viaduct about 50 feet long has been erected to connect the old brick pier on the island with the site of the north-west pier.

*At North Queensferry.*—The diving-bell, with its traveller and necessary appliances, is now in position at the south-east pier, and work will commence in a few days.

The electric light is now in regular operation on almost all parts of the works. It is to be used for lighting the caissons during the process of sinking.

#### Permanent Works.

*At South Queensferry.*—The masonry of viaduct piers Nos. 3 and 4 has been raised 4½ feet, that of No. 5 5½ feet, and that of No. 6 32 feet. All these four piers, with the exception of No. 6, which is 4½ feet lower, are now 27·85 feet above O.D., at which level they will remain until the erection of the girders is completed. The rivetting of the large caisson for the south-west pier has been carried on continuously, and the shoe and roof of the air-chamber, the most difficult parts of the work, are now finished. The delivery of the caisson for the south-east pier has been commenced.

*At Inchgarvie.*—At the north-east pier the permanent caisson, varying from 3 to 10 feet in depth, has been rivetted up and lowered into position, and the temporary caisson is now being added to it. The construction of the deep caissons for the south-east and south-west piers is well advanced in the South Queensferry shops, and the pontoons to float the caissons into position are now on their way from Belgium.

*At North Queensferry.*—The rock excavation for the caisson at the south-west pier has been retarded by the prevalence of strong

south-westerly winds, but it is now nearly completed. At the south-east pier the diving-bell is now in position. A large amount of boring with diamond drills and blasting has been carried on, and it is expected that the work in the bell will be confined to trenching and levelling the rock to make it suitable to receive the masonry of the pier. The north-west pier has been built up to the level of the under side of the coping, and a two-inch wrought-iron belt, 18 inches deep by 1½ inches thick, is being built into the masonry. The inside of this pier has been lined with blue bricks for a depth of about 8 feet. The excavation for the north-east pier has been completed, the holding-down bolts fixed in position, and the masonry is about being commenced. The north cantilever pier has been carried up 14½ feet, and is now 66 feet above O.D. The south pier of the north abutment has been founded on the hillside, and carried up about 30½ feet.

*Superstructure.*—About 650 tons of steel plates and 380 tons of angle irons and ties have now been delivered. The first of the large tube-drilling machines has been started, and has drilled all the holes in about 20 feet length of tube. About 150 plates, weighing 1½ tons each, have been bent in the hydraulic bending press, and the edges of 100 of these have been planed. A full-sized model of the first skew-back is in progress. The plates composing the lower bed plates for the North Queensferry, north-east, and north-west piers, have been planed, fitted, and drilled; the upper bed plates for these two piers are in progress. The bracing between these piers has been commenced. The first pair of the viaduct girders is expected to be delivered by the end of the month. A testing machine has been erected in the Queensferry shops, in which we witnessed some satisfactory experiments as regards the tensile and compressive strength of cuttings from some of the steel plates. About 96,000 cubic feet of granite have been delivered, of which 64,000 cubic feet have been set, and about 8,000 cubic yards of concrete are now in position. As the result of this our fourth quarterly inspection, we are able to report that the progress and quality of the various works, so far as we are in a position to form a judgment, continue to be satisfactory. The boulder clay upon which the foundation of the south cantilever pier is to be built appears to be, where we saw its surface exposed in the coffer dam, hard and compact, and well adapted for carrying the pier.

### EDINBURGH ARCHITECTURAL ASSOCIATION.

THE members of this Association, under the direction of Mr. G. Washington Browne, paid a visit on Saturday to Dundas Castle, Hallyards Castle, and Kirkliston. The company, numbering about thirty, first drove to the ruins of Hallyards Castle, on the estate of Newliston. The castle, which was built in 1630, is now in a very dilapidated condition, but there are still evidences of its having possessed much architectural beauty in its details, and it is considered a good specimen of a gentleman's residence at that period. The early Gothic features are retained in the moulding of the panel over the doorway, traces of smooth plaster are to be seen on all the walls, and the ends of the joists are still visible in several places. The fireplaces on the principal floor have had richly moulded jambs, but the sleeping apartments do not show the same ornamentation. A deep rent, extending the whole length of one of the gables, points to an inherent weakness in the structure. The company next proceeded to Kirkliston parish church, of which Mr. Browne gave some historical notes. The ancient building is supposed to have been erected about the twelfth century. The church of Liston was in early days of great value, and, along with the village, the mill, and much of the adjacent lands, it was granted to the Bishop of St. Andrews, but at what time was not certain. Liston was at one time a rectory, and was referred to as such at intervals between 1296 and 1409. In 1593 Parliament passed an Act dissolving the parsonage of Kirkliston, and it was attached to Dunfermline till the abolition of Episcopacy in 1690. Tradition says that a family of the name of Liston possessed great property in the neighbourhood, and it was not unlikely that the place took its name from them. At the western end of the church there is one of the earliest saddle-back towers in the country. The building has been considerably altered and added to of late, but care has been taken not to interfere with the old Gothic work. The old Norman doorway, which at one time formed the main entrance to the church, was examined by the party with much interest. Through the kindness of Mr. Jas. Russell, a visit was next paid to old Dundas Castle, the former residence of an historic Scottish family. The building, which is in an excellent state of preservation, is L-shaped, with an irregular square tower on the outer angle. This tower commands a magnificent view of the Forth and the surrounding country, and on its summit a beacon light was placed in olden times. The entrance to the tower is guarded by an ingeniously-constructed iron gate, one of the few of the kind existing in Scotland. Votes of thanks having been given to Mr. Russell, and to Mr. Browne for the instructive manner in which he had pointed out the various features of interest in the different buildings, the company returned to Edinburgh by way of Dalmeny, having spent a most enjoyable afternoon.

## NOTES AND COMMENTS.

THE new church of the Oratorians at South Kensington has given satisfaction to all who have seen it, although much requires to be done to complete the interior and exterior. The building is impressive, and is well arranged for Roman Catholic ritual. Indeed, some ministers of other congregations who have visited the Oratory have expressed a wish that their own buildings were equally capacious. The site has been well utilised, and the church appears larger than was anticipated. By using pilasters of dark Devonshire marble a contrast is afforded, but in the sanctuary they are less effective. That part of the church somehow does not obtain the importance it should possess. The workmanship appears to be excellent, but the tie-rods in the arches and dome are not tokens of strength, although there are too many Italian precedents for them. The treatment of details shows good taste throughout. We are glad to be able to say that the English work is far purer in style than that which is seen in the large altar from a Dominican church in Italy, which has been set up in the Oratory, and is considered to be the most valuable part of the new building. The success of the work augurs well for Mr. GRIBBLE'S career.

THE Arundel Society has at length brought out a complete edition of the large illustrated book on Italian Sepulchral Monuments, which has hitherto been sold only in parts, and without the introductory portion. An historical and critical essay giving a synoptical view of the whole subject had long been promised by the late Mr. G. E. STREET, R.A., but the constant pressure of his professional duties, followed by his untimely death, prevented him from doing more than preparing a collection of notes and rough sketches of monuments as the foundation of his treatise. With the aid of these notes, however, Mr. PERKINS, the author of the two well-known works on Tuscan and other Italian sculpture, has now supplied the promised introduction. The entire publication is divided into seven parts, each containing seven plates in permanent photography, from Mediæval and early Renaissance monuments in Italy, chronologically arranged, with descriptive texts from the pen of the photographer, Mr. STEPHEN THOMPSON.

THE Commissioners who were appointed to inquire into the working of the City Companies have, as was anticipated, arrived at conclusions which will be thought to be revolutionary in the City. The annual value of the property owned by the Companies amounts to about three-quarters of a million, and it is needless to say that all the money is not applied to the public advantage. The dinners and other entertainments are admitted to cost 75,000*l.*, and probably the outlay should be put down at a much larger sum. It is proposed that a Suspension Bill should be introduced into Parliament in order to prevent any alienation of the property of the Companies, and that afterwards the Charity Commissioners or a Special Commission should have control over the funds, which it is suggested should be applied to some object of a Metropolitan character. The present system of introducing members who have no connection with the trade represented by a Company is also to be amended.

FRANCE, like other countries, is suffering from the altered condition of commercial affairs, and, as happens elsewhere, it is considered that there is more need of knowledge among merchants and manufacturers. The French Government have accordingly requested the chambers of commerce to give their opinions as to the desirability of establishing commercial museums in the large ports for the benefit of the commercial and industrial classes at home and abroad. There is such a museum in Bordeaux, which has been in existence for many years. It contains an interesting collection of specimens, both of all raw and manufactured articles, of French trade and of French colonial products, as also of building materials, tools, implements, and various objects connected with the trade, industry, and agriculture of France.

ON Wednesday another attempt was made to amend the irregularities of the copyright law. In the House of Commons Mr. HASTINGS brought in his Bill for the repression of the commission of fraud in the production of works in fine art

and photography, and it was formally read a first time. It must be owned that this year there is less interest taken in the question than was the case formerly, but it does not follow that the Bill on that account will not become law.

THE cost of education under the School Board has given rise to much grumbling in England, but the inhabitants of the islands of Scotland would seem to be even more oppressed by the amount of the impost. In the island of Lewis, which is a poor place, the school-rate amounted at one time to 6*s.* 8*d.* in the pound, although it was contemplated that the rate was not to exceed 3*d.* in the pound. The principal cause is supposed to be the number of new schools which have been erected. In Lewis, of which the total rental is 24,231*l.*, the amount spent in school buildings since 1873 has been 54,549*l.* 13*s.* 7*d.*, of which 33,210*l.* 2*s.* 11*d.* was advanced by Government, at  $\frac{3}{4}$  per cent. interest, payable in fifty years. The balance due on May 15, 1882, was 22,403*l.* 17*s.* 1*d.* One parish, Lochs, with a population of 6,284, and a rental of 4,670*l.*, has expended the sum of 20,311*l.* 17*s.* 2*d.* on twelve school buildings, and still owes 8,983*l.* out of 12,428*l.* advanced by Government. Out of 152 ratepayers in the parish 107 pay rents under 7*l.* In the parish of Harris 14,803*l.* has been expended on school buildings, or more than two years' rental, and in North Uist 9,384*l.* That Scotland is willing to sacrifice much for education has been proved, but it is hardly fair for a Government department to compel the people in a remote island to erect buildings on a scale that is beyond their requirements, and in a style that is exceptionally costly.

THE trade in American timber is no longer confined to the Northern States. The enormous destruction of the pine forests in the North has directed the attention of lumbermen and capitalists to the Southern timber lands, in which money has been largely invested. The port of Mobile is likely to become one of the most important ports for the trade. During the past year the shipments of lumber to foreign ports have amounted to about seventeen million cubic feet of timber, of which three millions were exported to this country. The hewn and sawn timber sent to Great Britain formed three-fourths of the entire quantity that left Mobile. Seeing the success of the South, and in order to put some check on the imprudent destruction of timber in North America, the Canadian authorities have issued a circular which claims that clearings on the dry summit lands, instead of on the lower-lying and richer alluvial soils, causes dried-up springs and flooded valleys, and that covered hill-tops are required for the retention and distribution of moisture, and are worth to the crops produced four or five dollars per acre.

THE new process of staining marble, which the inventor, Dr. HAND-SMITH, calls the Endolithic, has already received approbation from several members of the Royal Academy. At the Piccadilly Hall the applicability of the process is seen in a copy of Mr. BOEHM'S bust of *Carlyle*, in a slab showing a part of Mr. POYNTER'S design for the adornment of the dome of St. Paul's, and in various panels, medallions, dados, tables, tiles, &c. Whether colour should be imparted to marble and stone has been a disputed question. JOHN GIBSON'S splendid figure of *Venus* was, in 1851, considered to be less successful than HIRAM POWER'S *Greek Slave*, because he acted on his belief of Greek practice, and tinted the figure in a delicate colour. Since that time people in this country have had more opportunities of studying sculpture, and with so many Mediæval and Renaissance precedents before them a coloured statue or relief no longer is thought to be as vulgar as it would have been thirty years ago. Coloured sculpture can well be utilised as an element in architectural decoration, the quality of the work depending on the skill of the artist. What Dr. HAND-SMITH claims to have discovered is that he can apply colour in such a way that it is no longer a superficial coating liable to be affected injuriously by time and the atmosphere. By his treatment the material, whether marble or ivory, absorbs the colour to any depth that is desirable, and can be converted into a true endolith, or stone picture, which will endure as long as the substance itself. A design would in this way secure as great a permanence as if it were worked in mosaic, while the new process allows of more fidelity to an original, infinitely better contours, and the cost will be far less than mosaic.

## ILLUSTRATIONS.

INTERIOR OF THE NEW SHIRE HALL, SHREWSBURY.

THE Shire Hall at Shrewsbury has been lately reopened, after a reconstruction which has been effected according to plans prepared by Mr. T. M. LOCKWOOD, architect, of Chester. We illustrate one of the courts, and it will be seen that, so far as regards the facilities for hearing, every provision is made. The ceiling has been built as low as is consistent with the dignity of the court from an architectural point of view, and is coved down to the walls so as to better reflect the sound from above, and the wall spaces are slightly broken up to prevent echo. The ceiling light is obtained by an extensive and artistic horizontal light of stained glass, level with the ceiling. This mode of lighting, and the arrangement of the corridors on each side, insures the perfect quietude of the courts, and also facilitates ventilation. Below the judge's seat is accommodation for the associates, and in front of this is the solicitors' table. Facing the bench is a double row of conveniently-constructed seats and leather-covered sliding desks, for the use of counsel. Behind these, and in the well of the court, is the dock, which immediately communicates with the cells below by means of a flight of stone steps. Places are here also provided for the governor and deputy-governor of the gaol, and for several warders; and on the other side is accommodation for solicitors in waiting; while behind the dock are three semicircular rows of seats for prosecutors, witnesses, and other persons interested in the cases in progress. In the rear a capacious stone gallery affords accommodation for the public, entrance being effected from a corridor adjoining High Street. The court fittings throughout are of polished oak, while the pilasters, cornices, and upper portion of the inner walls generally are of moulded Parian cement.

Artificial illumination is afforded by means of four sun-burners, each containing sixty-three jets. The sunlights also act as ventilating shafts, and the heat generated by the gas is thus carried off without perceptibly affecting the temperature of the court, which in hot weather is rendered cool by means of a current of air washed and cooled before it enters the courts, by an ingenious contrivance in the shape of a small water-spray. By the use of ice in the cooling-chamber the temperature can be still further reduced.

Convenient access is furnished to the cells in the basement, and therefrom to the docks in each court. The ground-floor accommodation comprises spacious and well-lighted entrance and waiting-halls, rooms for the clerk of the Crown, and waiting-rooms for male and female witnesses. From these waiting-rooms witnesses obtain access to the courts in close proximity to the respective witness-boxes. The jury retiring-rooms, with their offices, &c., are on this floor. In the old portion of the buildings next the front provision is made for the mayor's court and retiring-rooms, which are greater in area than before. In the two upper storeys are offices for the clerk of the peace, county treasurer, and town clerk, with their clerks' offices. The front and side of the old building, which are of Grinshill freestone, are left entirely intact, except so far as regards the necessary repairs and restoration.

The dimensions of the new courts are as follow:—Length, 52 feet; width, 36 feet; height, 34 feet; height of side galleries, 7 feet. The ceiling-light of each court contains eight panes of stained glass, each bearing a coat-of-arms.

The arrangement of the new courts has given general satisfaction to all classes, from the judges to the general public. Baron HUDDLESTON said that all the other counties of England might be fairly challenged to produce more commodious or more convenient courts, and, with the exception of one or two, he did not know of a better in England. At the Quarter Sessions, which were held on April 9, the chairman drew attention to the remarkable circumstance that not a single penny had been expended in extras on the building, the estimated sum of 25,385*l.* having been sufficient.

The general contractor was Mr. SAMUEL WARBURTON, of Manchester. Messrs. DENNETT & INGLE constructed the whole of the floors on their fireproof system. The stained-glass, ceiling, and other lights are by Messrs. SHRIGLEY & HUNT, and the effective internal decoration is by Mr. FRANCIS SMITH, of Chester and London. Mr. J. S. HAM was clerk of works, and Mr. H. ROWLAND the builder's superintendent.

EXTENSION OF ST. ANDREW'S CHURCH, NOTTINGHAM.

THE necessity for additional means of exit, without loss of seat-room, has induced the vicar (Canon TEBBUTT) and churchwardens to extend their church in the manner shown in our illustration. The new doors entering the church, and also the screen folding-doors dividing the new north porch, are all hung folding, and open outwards, so as to avoid draught and allow easy exit in case of necessity.

The western extension gives about one hundred additional sittings, and opens into the nave with two bold arches and centre-clustered columns. The interior effect is excellent, and the acoustic properties considerably improved. The cost was 809*l.*

The contract was undertaken by Mr. F. W. ADCOCK. The architect is Mr. SIDNEY R. STEVENSON, Victoria Street, Nottingham.

NOTTINGHAM MECHANICS' INSTITUTE.—NEW READING-ROOM, ETC.

THE accommodation of the building of this Institute has recently been very much increased by the addition of a commodious new reading-room, 80 feet by 26 feet; store-room (of similar area) in basement; kitchen, 36 feet 6 inches by 19 feet 6 inches, and a complete system of water-closets, lavatories, and urinals.

The new buildings are erected on a long strip of ground, having a frontage of about 30 feet to Milton Street, on which they abut with a semicircular stone front, covered with a green slated roof, surmounted with an open timber dome. The height available was somewhat limited, owing to the existence of important side-lights in the old building. The additions are mainly lighted from above, and RENDEL's patent glazing has been exclusively patronised. The chief contractor is Mr. HENRY VICKERS and the hot-water and sanitary engineers, Messrs. GODDARD & MASSEY, both of Nottingham.

The office of honorary clerk of works was filled by Mr. JAMES GRANGER, who was also a member of the Building Committee. The architect is Mr. SIDNEY R. STEVENSON, Victoria Street, Nottingham.

TRINITY CHURCH, BROMLEY COMMON, KENT.

THIS illustration shows a new apse, organ-chamber, pulpit, choir seats, &c., which have been erected in memory of the late Mr. G. W. NORMAN, by his children and family. The additions, with the exception of the pulpit (carved by Mr. EARP), have been executed by Mr. WILLIAM SMITH, builder, of Bromley, and the stained-glass windows are by Messrs. CLAYTON & BELL. The work has been executed from the designs and under the direction of Mr. C. PEMBERTON LEACH, architect, 31 Spring Gardens, Charing Cross.

SKETCHES IN NORTHAMPTONSHIRE.

THIS illustration is from sketches by Mr. J. BUTLER WILSON, architect, Leeds.

## YORK ARCHITECTURAL ASSOCIATION.

AT the last meeting of the present session of the York Association, Mr. T. R. Dickinson gave a lecture on "Warming and Ventilation of Buildings." The lecturer, after alluding to the importance of the questions, explained the composition of the atmosphere, and showed that, without a due supply of oxygen, life and combustion are impossible. Air once inhaled was not only absolutely unfit for further use, but vitiated a considerable quantity of the surrounding atmosphere. He described several ancient methods of warming rooms, and traced the beginning of the present system of fireplace and smoke-flue. He next noticed the fire-grates and stoves at present in use, pointing out how warming and ventilation may be combined; the different methods of introducing fresh air, either cold or artificially warmed, into a building; the various contrivances for extracting vitiated air; and, finally, the necessity of ventilating stables and similar buildings with as much care as dwelling-houses. A discussion followed, in which Messrs. Shires, Yeoman, Hepper, and Brown took part; and, on the motion of Mr. William Brown, vice-president, seconded by Mr. Geo. Benson, architect, a hearty vote of thanks was accorded to the lecturer, who briefly responded. Mr. B. Priestly Shires announced that the programme for the summer months would this year be a very interesting one. Amongst the places to be visited were Leeds, Ripon, Helmsley, Howden, Whitby, Bridlington,

Castle Howard, &c. With a view to increase the interest of the students and others in sketching, it had been decided to inaugurate a sketch-book, which should bear the name of the Association, and he hoped it would prove a most valuable adjunct to the future prosperity of the society.

### THE CASTELLANI COLLECTION.

THE total sum realised by the Castellani collection at Rome, the sale of which occupied twenty-one days, was about 48,000*l.*, but the total would have been much larger if thirty of the most valuable articles had not been withdrawn in consequence of the high-handed proceedings of the Italian Minister of Public Education. The Italian Government was anxious to buy the whole collection as the nucleus of a new museum similar to that at South Kensington, but not having the necessary funds the Minister, basing his action upon a Papal decree of 1820, claimed the right of pre-emption (*prelazione*) over thirty of the choicest articles. The heirs of Signor Castellani protested against the legality of this and commenced an action in the Civil Courts, but, as this was not likely to be decided for some months, it was resolved to proceed with the sale of the other articles in the catalogue. The sale accordingly commenced at the time appointed in the Palazzo Castellani, transformed for the time into an auction mart, the sale of the antiquities having attracted Mr. Newton from the British Museum, Mr. Fortnum from South Kensington, M. Frohner (the late Conservator of the Louvre, who had prepared the catalogue), and representatives of the Berlin and Lyons Museums. The articles on which the Government had laid an embargo were mostly antiquities, so that the value of this part of the collection was appreciably lessened, but several of the lots fetched very high prices. A vase found in the Santa Maria Church at Capua, and beautifully painted in various colours, fetched 1,000*l.*; and a Greek mirror from Corinth, with bronze frame and figures of Venus and Cupid, 154*l.*; a small statuette of an Etruscan warrior, little more than 4 inches in height, 141*l.*; and a Diana in terra-cotta, of a period little later than that of Pheidias, 280*l.* The terra-cottas which the late Signor Castellani had purchased in Asia Minor realised the highest prices ever known, a figure of Victory, holding a gilt crown and a bouquet of flowers, being sold for 248*l.*, and a Venus recumbent for 240*l.* The gold and silver ornaments were also sold for very high prices. The poignard in copper gilt which Mariette Pasha found encased in the mummy of the Egyptian King Amasis, and which was for some time the property of Prince Jérôme Napoléon, fetched 300*l.*; a single earring, the fellow of which is the property of Baron Edmond de Rothschild, of the oldest Greek style, 652*l.*; an Etruscan bracelet, of parti-coloured glass, with a gold clasp, 160*l.*; two rings engraved with the busts of a woman and a man, 374*l.*; and a marble bust of an Amazon, attributed in the catalogue to the school of Polycletus, 1,080*l.* The sale of the Venice glass, the Italian and Oriental earthenware, the enamels, tapestries, Renaissance bronzes, &c., attracted many more people, and three glasses by Murano fetched 320*l.* apiece. A vase in Gubbio earthenware, attributed to Giorgio Andreoli, was sold for 600*l.*; a cup of the same kind for 668*l.*; a Pesaro bowl for 324*l.*; another from Urbino for 180*l.*, and a Caffagiolo cup for 242*l.*; a dish in Persian earthenware made 240*l.*; a replica upon a small scale of the famous fountain of Giovanni de Bologna, 292*l.*; an eleventh-century bas-relief in ivory, representing Christ and one of the Apostles surrounded by angels, 172*l.*; a powder-flask of the sixteenth century, 156*l.*; a shrine made in the shape of a house and decorated with Limoges enamels of the thirteenth century, 828*l.*; and another larger one, by Raphael Grimaldi, 1,020*l.*, being purchased for the South Kensington Museum. The antique bronzes and other objects which, it was hoped, would have come to London, are to be sold in Paris on May 10 and following days.

### HIGHLAND DWELLINGS.

THE report of the Commission of Inquiry into the condition of the crofters and cottars of the Highlands and islands of Scotland has been published. Among the subjects treated is that of the dwellings of these classes of people. The Commissioners' remarks are as follows:—

Among the various inconveniences which the people of the Highlands and islands suffer in connection with their position as occupiers of land, the one which strikes the stranger as the most deplorable, and which affects the native with the least impatience, is the nature of their dwellings. It is difficult to say how far the crofter or cottar is sensible of the disadvantages attached to the darkness and deprivations of his primitive habitation, or how far this feature in his life is actually prejudicial to his happiness and welfare. In the main his house does not make him unhappy, for he does not complain; it does not make him immoral, for he is above the average standard of morality in his country; it does

not make him unhealthy, for he enjoys an uncommon share of vigour and longevity. Yet no one concerned for the elevation of the Highland people can fail to desire an improvement in this particular; no one can doubt that if they are well-conducted and robust it is in spite of their lodging, and in consequence of counter-acting causes, and that if they enjoyed the benefit of purer and brighter homes they would prosper more. The Highland houses of the poorer sort are divided broadly into two classes—the black houses and the white houses. The black houses present the original type of the country, and they are built by the people themselves; the white houses are lowland cottages of the plainest character, and they are built by the people aided by the proprietors. The black house still predominates in the Western Islands, on the northern and western coasts of the mainland, and perhaps in the central Highlands. These humble dwellings are by no means uniform in character; in the lowest stage there is the sordid hovel, in which horses, cows, and pigs occupy one end of the undivided tenement, while the human inhabitants, accompanied by dogs and poultry, are immersed in obscurity and dirt at the other. When seen in a superior form the Highland cottage, though thatched with grass or heath, floored with clay and built with untempered stones, may yet possess a chimney and a window in the wall, a door unshared by the cattle, a partition between the stall and the lodging, and when kept clean does not offer an unpleasant aspect, animated as it often is by the loom or spinning wheel, by a hospitable welcome, and by kindly faces. The ancient model of Highland habitation may indeed be contemplated with too much indulgence by those whose minds are not duly possessed by considerations of utility and sanitation, for it is associated in fancy with all that is most pleasing and romantic in the manners and history of the people, while in form and colour it is in perfect harmony with the landscape and the shore. The white house may be seen everywhere, but it is most common on the eastern side of the country, and in Orkney and Shetland. It consists of two rooms on the ground, often with a bedcloset between them, and sometimes with garrets in the roof. It has two chimneys in the gables, and windows designed to open and shut; the walls are built with mortar, one end is floored with boards, the other with earth or flags, the partitions and ceilings are of wood and clay roughly put together, the roofing is of boards covered with thatch, or felt daubed with tar, or exceptionally with slates. The white house is not attractive and not picturesque, but it is usually built apart from the byre, and it is tolerably dry, light, and free from smoke. It stands half-way between the original hovel of the Celtic peasant and the comfortable and comely dwelling which the substantial crofter of the future may, we trust, possess. Where this description of house is the joint production of the occupier and the landlord, the stones, the carriage of materials, and all the labour, skilled and unskilled, are usually supplied by the tenant; the lime and wood, sometimes fashioned, sometimes in the rough, are furnished gratuitously by the landlord; slates when required are obtained from the same source, but for these repayment by instalments is in some cases expected. The system of co-operation in house-building varies so much on different estates, and is perhaps modified so much in particular instances, that any attempt to define a general rule must be in some degree deceptive. The same remark applies to compensation awarded to the occupier for his share in the erection of buildings. In the case of the black house, the occupier is permitted to carry away or sell the timbers of the roof, or receives some allowance for them from the proprietor; in the case of the improved dwelling, we have not heard of any liberal system of compensation; the occupier in a great measure labours and spends at his own risk, each case will be dealt with apart, and the amount awarded will depend more on the means and the generosity of the landlord than on the equity of the claim. There is even in the remoter and least advanced parts of the country an unmistakable movement in the direction of improved accommodation, stimulated partly by the encouragements afforded by liberal proprietors, partly owing to increasing intelligence and emulation among the people. To this movement a considerable impetus would, we believe, be imparted by the provisions for improving leases suggested in this report. It would not be possible in this matter to attain definitive results by precipitate and imperative legislation. Proprietors could not possibly undertake the erection of model dwellings and farm offices on small holdings. The occupiers are equally incompetent for the purpose. The cost of a house and steading on a 10*l.* croft which would satisfy the educated expectations of a Government inspector would exceed the capital value of the holding, and the smaller the holding the greater would be the proportionate outlay for the improvement. Under these circumstances, it is evident that the process of amelioration must be prosecuted with deliberation and by mutual assistance, keeping in view the resources at the disposal of the proprietor, and the means, the habits, and the desires of the tenant. Public authority, which is powerless to create by any peremptory proceeding a higher order of dwellings for the Highland poor, is competent to correct abuses which are offensive to the first principles of decency and health. We feel ourselves debarred from making specific recommendations on this subject, in view of the recent appointment of a Special Commission by your Majesty to inquire into the

dwellings of the poor. It is assumed that the commission will, in one form or another, carry its investigations into the Highland districts.

### ARTISTS' BENEVOLENT FUND.

THE seventy-fifth annual dinner of the Artists' Benevolent Fund was held at the Freemasons' Tavern on Saturday evening, Sir Coutts Lindsay, Bart., presiding. A printed report was submitted, showing that during the past year fifty-eight widows and 16 orphans received annuities, amounting in the whole to 1,203*l*. Since the establishment of the Society 46,893*l*. has been distributed in relieving the widows and orphans of artists. The chairman, in giving the toast of the evening, "Prosperity to the Artists' Benevolent Fund," dwelt upon the value of such an institution, and congratulated artists on the rapid advances which of late years their profession had made. Formerly fathers did not care to allow their sons to become painters or sculptors, but now no profession ranked higher. The Society, with its two branches, the Annuity Fund and the Benevolent Fund, showed them the best way of making provision, and he trusted they would be enabled to still further develop interest in the institution, and to enlarge its sphere of usefulness. Mr. Beresford Hope (president) replied, and gave "The Health of the Chairman," who briefly made his acknowledgments. Other toasts, including the healths of the honorary physicians and medical officers, having been given, the proceedings were brought to a close. Subscriptions to the amount of 600*l*. were announced.

### ARCHITECTURE IN AMERICA.\*

THERE is much good building going on at the present moment in this country, as it is hoped will be shown in these papers. If it were quite clearly perceived by the public to be such—that is, if it were more evidently distinguished from the bad work flourishing beside it—there would be less excuse for their preparation. That this bad work does so rankly flourish is by itself sufficient proof of a widespread deficiency in knowledge, since, as I have said, architecture always comes in answer to a distinct call of patronage.

It is instructive to note in this connection the character of our recent architectural work done under Government supervision. As stated in the Treasury report laid before the present Congress, no fewer than twenty-seven Government buildings, many of them vast in size and costliness, have been in process of erection during the year just closed, in almost as many different cities of our land. It is safe to guess from the examples with which we are most familiar that very few of them are sensible structures, not one a really admirable work of art—safe to say that scarce a single building put up under Treasury direction since the days of Mr. Potter's service could, by any stretch of courtesy, be included in a list of our true successes. The various local governments of state and city have a little better record to exhibit; but it will be found that most of the works coming under the general head of "public buildings," which will here be named for praise, while intended, it is true, for public or semi-public use, yet owe their existence to the fortunate instinct of individuals or of private corporations.

There was, as Mr. White has lately shown my readers, a distant time when building as a fine art was in our country the rule and not merely the exception. While our fathers were colonists or very young republicans they built very well—sometimes beautifully, and almost always honestly, intelligently, appropriately, and with a simplicity of aim and manner that was the very reverse of affectation or vulgarity. But the years which lie between their time and ours were dead indeed to art—were characterised at first by a helpless sort of ignorance, and later on by crass vulgarity and barbarous display. It is not necessary to describe these phases in a detailed way, since I am by no means essaying to write a history of American architecture. Every reader who has used his eyes will find in his own memory types of the various sorts of failure we achieved—types which are only interesting now as standards by means of which to gauge the undeniable advance of very recent years. I may say one word, however, with regard to the kind of work that came in fashion soon after that early kind which Mr. White has praised. The remains of the "Classic style" that flourished for so many years—in stone in our large cities, in pine boards and paint and stucco in our smaller towns—have long been pointed out for ridicule even by those who hold no other architectural tenet with distinctness save this as to the ludicrous folly of attempting to fit Greek temple forms to our modern uses and our often cheap materials. Such attempts are no doubt mistaken, and their results are often ludicrous enough. Yet after all the fashion has, I think, been rather unduly be-rated, for it had a certain amount of at least comparative excellence. It proved that its generation admired, if but in a stupid sort of way, the finest architectural style the

world has ever seen. Later on, admiration was transferred to far inferior models, while current methods of adaptation and execution remained quite as stupid and grew still more inartistic. And a poor work following a fine example, though at an immeasurable distance, is better at all events than another work in which execution and ideals are alike despicable and ugly. And be the work poor as it may, there is a dignity and a simplicity about Greek forms which prevent utter barbarism or hideousness of result—which prevent, for one thing, any accent of vulgarity. There are many far worse public buildings in New York than the Custom House on Wall Street. We might easily count up those which are much better, at least from an artistic point of view. And the pillared wooden temple which does duty for church or court-house in the village street is usually a far better thing in itself, and far more agreeable in its testimony to the taste if not to the practical wisdom of its builders than is its later neighbour—a bastard structure with vulgarised reminiscences of many styles and no styles, and much riotous ornamentation in sanded zinc and jig-saw carving.

The ties of this our new world with the old are of such complex sorts that it would be impossible to guess, without inquiring into facts, whence may have come our impulse in any artistic path. Such inquiry will show that in our architecture we have largely followed England, though her example has not been consulted by our painters or our sculptors. England, as is well known, has been through a varied and perplexing architectural experience since the beginning of the century. First, there dawned the Greek revival, instigated chiefly by the publication of Stuart and Revett's "Athens." Then came the Gothic revival, bringing about the famous "battle of the styles" between Classicism in general and Mediævalism in general, and the faction fights (almost as bitter) of the Mediævalists among themselves. Every phase of English Gothic had its exclusive advocates, and there were others, almost as exclusive, who enforced in stone as well as in speech and print the claims of French or Tuscan or Venetian builders as the best models for the modern architect to follow. Then, just when the main battle seemed to have decided itself in favour of Mediævalism, and when the partisans of the triumphant movement seemed to have settled into some sort of agreement among themselves—or at least into such mutual toleration as would let them all live and work in their several ways and insure the advance of the Gothic movement as a whole—just when its teachers and preachers began to draw breath and consider their cause gained for all time to come, began an unexpected reaction among the younger men into a love for late Renaissance work. "Queen Anne" is the term popularly used of this newest style, and may do as well as any other meaningless ticket to label its results when they must be mentioned. But no term could be historically more inexact. The builders of Queen Anne's day—whose influence we see in our own colonial work—discreet, sober, and dignified, even when nothing more, would be the last to accept the paternity of the motley new fashion, which is in truth less English than Dutch, and less "Queen Anne" than a mixture of Jacobean and Georgian manners, and which most rarely counts among its qualities those of discretion, sobriety, and dignity.

All these successive phases in English work were imitated here in more or less faithful and more or less successful ways. Of the Grecian fashion I have already spoken. It reigned for a time as wholly as it did in England, though with variations due to our lesser wealth and our different materials. The Gothic movement, however, was not quite so cordially endorsed on this side of the water as upon the other. English Gothic forms found little favour except for ecclesiastical and collegiate work. It was only the Venetian Gothic which at one time bade fair to be really popular with us. Many important buildings were erected in this style, like Mr. Wight's Academy of Design in New York, and the large structure on the corner of Boylston and Tremont Streets in Boston. In it Mr. Eidlitz designed some of his best work, as, for example, the piano warehouse on the west side of Union Square. Messrs. Potter & Robinson, again, who at one time were the most prominent of our younger architects, have usually preferred this style, and with it have done some excellent work, notably on the Princeton College campus. But none of these buildings especially concern us here. I cannot try to praise everything good that has been done in the past—even in a past which lies close behind us. I can only endeavour to show what is being done to-day in ways that bid fair permanently to influence the development of our art. And Venetian Gothic with us is already, I think, a thing of the past. Isolated examples will continue, very likely, to be built; but it will hardly count any steady adherents among the younger men in whom lie the promise of our future.

The recent "Queen Anne" fashion has been taken up here with much enthusiasm. I cannot speak, except through an acquaintance, with the prints in English journals, of its very latest essays on the parent soil; but it seems to me as if, with all the wildness and folly that have sometimes marked its presence here, we have still been somewhat more sober, if somewhat less ambitious, than our brethren. Both here and there good work, too, has of course been done when the style has been discreetly dealt with. But what our share in them amounts to I can only show in later portions of my commentary.

\* From an article in the *Century* for May.

Just now I would add that, strong as has been the influence of England on our work, it has not been so exclusive as is commonly thought—at least by Englishmen. Much of our best architecture claims a very different parentage. Italian Renaissance examples have directly inspired some of our most important essays, and modern French fashions have evidently dictated the forms of very many others. Domestic work in New York, again, is chiefly founded on the “high stoop” model, which is not English but Dutch; and though this manner of building has scarcely touched either Boston or Philadelphia, it has become largely characteristic of Washington and of our newer Western cities. And the so-called decoration adopted for it, when it deviated from the simplicity of the original Dutch model and evolved the typical “brown-stone front” of New York, is not English, whatever else it may be called. The statement often made by writers in English architectural journals that there is nothing good or bad in America which has not its exact prototype with them, is very wide indeed of the truth. We have been and still are not only far more continental, but far more original in our architecture than we even realise ourselves. To ask how often this originality has been a thing to boast of, is to open up quite another question—a question which would need first of all for its decision the settlement of the time-honoured problem as to whether mistaken originality or the servile copying of good examples is the more promising mood in art. Two things are, however, certain. One is that our real epoch of productivity is but just beginning; and the other is that, whatever its course may be, whether peaceful or distracted, whether resulting in failure or success, it will work itself out on lines of its own—not upon those suggested by the contest still raging on the soil of England.

### THE ROYAL MANCHESTER INSTITUTION.

IN their report to the Governors, which will be presented at the forthcoming annual meeting, the Council state that, in accordance with the resolution passed at the last annual meeting of the Governors, the finances of the Institution have been put into sound condition; the consols having been sold, the debt owing to the bank has been paid off, and out of the balance of proceeds remaining the purchase has been made of 810% of 4½ per cent. debenture stock of the North British Railway Company. Lectures have been delivered during the session by Professor Knight, Mr. Frederick Wedmore, Mr. Harry Quilter, Mr. Richard A. Proctor, F.R.A.S., and Mr. Ernest Pauer. There has been a good attendance at the lectures. The net cost, after payment of all expenses, is estimated at 140%. At the special meeting of Governors, held in October last, the representatives on the Art Gallery Committee of the Corporation were re-elected, no change being made in the constitution of the seven representatives, namely, Mr. Thomas Ashton, Mr. C. J. Galloway, Mr. C. J. Pooley, Mr. C. P. Scott, Mr. R. Smith, Mr. W. A. Turner, and Mr. T. R. Wilkinson. The Council in August last offered a Heywood Prize of ten guineas for the most meritorious work of art produced by a present student of the Manchester School of Art, and a similar prize for the most meritorious work of art produced by a present student of the Manchester Grammar School School of Art, together with the Heywood medal if the works should be deemed of sufficient merit by the Council. These prizes have recently been awarded as under:—Manchester School of Art (ten guineas): to Charles F. Weston, for a full-length drawing from life; a drawing from the antique, by Miss Ethel Ellerby, and a painting of still life, by Miss Florence Carter, were highly commended. Manchester Grammar School School of Art (ten guineas): there being no single work of sufficient merit submitted, the Council decided to recommend the division of the prize between the following:—Study from life, by William Kneen; study from the antique, by William Kneen; design for wall-paper, by William Henry Cowburn.

### THE PROPOSED PARKS RAILWAY.

THE Bill which seeks powers to authorise the Metropolitan Railway Company to make a railway from their Edgware Road Station to King Street, Westminster, passing under Hyde Park, the Green Park, and St. James's Park, and also to provide for the improvement of Parliament Street, came before the Committee of the House of Commons on Tuesday. Mr. Littler, Q.C., on opening the case for the promoters, pointed out that whereas there was ample railway communication by means of the Inner Circle Railway between the east and the west of the metropolis, there was no communication whatever between the north and south, with the exception of the line from Ludgate Hill on to the Metropolitan at Farringdon Street. The street traffic of the metropolis, however, was enormous, and the manner in which it was increasing was shown by the fact that the number of persons carried by the Metropolitan Company had increased from 14,000,000 in the first year of the existence of the line to 74,000,000 last year. Notwithstanding this the street traffic was still in a most congested

state. He described at length the enormous population of the Edgware Road and its district which would be accommodated by the proposed line, and explained that the line would commence with a double curve from the company's existing line at Edgware Road, one branch running eastward towards Edgware Road Station, and the other westward towards the Bishop's Road Station. It would pass by means of a single tunnel down the Edgware Road to the Marble Arch. The depth of the tunnel below the surface would average from 6 feet to 10 feet. Although he believed there were many cellars beneath the footway, none of those would be affected, for the limits of deviation terminated at the edge of the footway. Occasional shafts would be placed in the road, but in no case would they be more than 20 feet wide, which would allow a carriageway on each side of these structures of at least 10 feet. The traffic along the road would in no way be impeded during construction. For the purpose of erecting a station at the Marble Arch it would, unfortunately, be necessary for them to take a couple of houses in Connaught Place which belonged to two members of that House, who strongly objected to the proceeding. They would, however, be amply compensated in the ordinary course, and would receive ten per cent. beyond the actual value of their property. The line then passed through Hyde Park at a considerable depth beneath the surface, and here it would be necessary to proceed by means of cut and cover, but only under such conditions as would satisfy the First Commissioner of Works. There were only two old trees which would be touched by the works, and only about forty-five altogether. From the Marble Arch to the Parliament Street end of the line the work would be effected by means of a double tunnel, in order to facilitate the ventilation of the line. At Albert Gate the line made a slight curve, and they proposed to take a row of low houses with shops for the purpose of making another station. A ventilating shaft would be run up at the back of the station, but it would be so closed in as to be out of view altogether, and would be carried up to a sufficient height to prevent the foul air affecting the inhabitants of the locality. From Albert Gate they would proceed in the same manner as from the Marble Arch to Parliament Street. Wherever it was found necessary to open roadways the work would be done at night and the surface made good by day, so that the traffic should not be impeded. One of the conditions of their obtaining power to go through the parks was that they should purchase on the best terms they could the block of property at Parliament Street, and the proposed works at this point he described as the most interesting portion of the scheme. Parliament Street would be widened to the same width as Whitehall, a much better access from Great George Street to Charles Street would be given than King Street, which would be obliterated, and a new street of about 50 feet wide would be made between and running parallel to Great George Street and Charles Street. Charles Street would be widened also, so that the thoroughfare would be one of 58 feet wide. The proposed station would be placed opposite to the India Office, but it would be surrounded by ornamental buildings in such a manner that it would be altogether out of view.

### THAMES COMMUNICATIONS.\*

BEFORE directing attention to the best sites for crossing the river, it will be well to consider what are the difficulties barring the adoption of the very many ingenious plans that have, from time to time, been brought forward.

Either for a bridge or a tunnel, suitable approaches must be provided, or some mechanical means, by hydraulic or other machinery, adopted for raising and lowering the vehicles passing over. The Snow Hill incline down to the valley of the Fleet is now almost forgotten, since it was bridged by the Holborn Viaduct and its level approaches; but the effect of such a gradient on heavy vehicular traffic can be well studied now at Tower Hill, which should never have been opened to waggon traffic, with a gradient between Thames Street and Tower Street of 1 in 18½ to 1 in 20; but the severity of such an incline can be even better seen at the curved approach from Smithfield down to the metals of the underground railway, well adapted to its locality in one respect, being, as it is, a veritable instrument of torture. The excessive steepness of the incline requires the addition of “leaders” to the teams of the heavily-laden waggons kept there for that special purpose.

This difficulty of approaches was one of the great objections to the high-level Tower bridge promoted by the Metropolitan Board of Works a few years back; and the same objection, in a less degree, tells against a tunnel, as the difference in level would be somewhat less than with a bridge. It was the absence of approaches for vehicular traffic that made Brunel's well-known tunnel at Wapping a dead letter for so many years till it was utilised by the East London Railway; and it was the indifferent, tortuous, and narrow means of access to the ferry erected recently near the same site which made it practically a failure, or at least one of the causes of its shipwreck.

\* From a paper by Mr. J. B. Redman, M.Inst.C.E., read at a meeting of the Society of Arts.

With modern experience and appliances a tunnel under the Thames may be constructed at any spot, but the cost would be very variable, from the great changes in the geological formation along the metropolitan river valley. Brunel's tunnel was mainly in sand and gravel, and so near the river bed that an artificial one was formed by throwing in clay in bags over the crown, and the excavation partly through it was effected by means of Brunel's well-known shield, the alternate compartments of which were pushed forward, after the material in advance of the polling boards had been removed by excavating from within. The frames, all connected at top by shafting, and provided with broad bases or feet, were pushed forward alternately, like (as Brunel used to say), a man's legs in walking.

A large percentage of the material brought into the tunnel from the heading in advance of the shield, was clay with pieces of the bags adhering. This I have frequently seen when periodically measuring up the work with Mr. James Walker (the leader of our profession at that day) under whose certificates the Exchequer Loan Commissioners' advances were made.

This variability of substratum is well illustrated by the various attempts made to cross the river by tunnelling. Early in this century a tunnel was commenced at Gravesend; the large quantities of water met with in the chalk, were, it is said, the cause of the abandonment of the undertaking. Still, at the present time, with our enlarged experience and improved plant and apparatus, such a work is within the limits of possibility, and an Act of Parliament has been obtained for a railway tunnel in the chalk, to connect Gravesend with the county of Essex. Now, when it is remembered that there are from 40 to 60 feet depth of water at low water in Northfleet Reach, upon a chalk bottom, it will be seen how great an undertaking such a work would prove, but still one that is practicable with the boring and air-compressing machinery of the day, at a certain cost.

An Act has been obtained for a tunnel or subway at Woolwich, and the works were commenced, but stopped from the abundance of water met with, mainly in sand and gravel.

In effect in certain portions of its valley, it amounts to attempting to pump the river dry—unless the work is done by pneumatic air—compressing tackle converting the tube or tunnel into one long diving-bell, provided with air-locks at one or each end, or by the dredging of a low water submarine channel, into which sectional lengths or compartments might be lowered, and the fixing all done by divers.

At Greenwich, for instance, a tunnel or subway to Millwall has been advocated in influential quarters; but when we have the broad fact before us that the river-bed, and down to the chalk substratum, is gravel and running sand for fully 100 feet in thickness, some idea of the character of such a work may be formed.

This is no mere theoretical speculation. About forty years back, Frederick Braithwaite, an engineer well known for such works, sank a well at the hospital brewery, then situate within the hospital enclosure, behind the pier, but which has since been removed. So much sand was pumped up in sinking this well that serious settlements of the brewery walls commenced, and the hospital authorities became alarmed and called in additional assistance. The well was ultimately sunk to the chalk.

I had again practical evidence of all this, being called in some years back by the directors of the Greenwich Pier to advise them on the condition of that work, for in carrying out certain works of reparation to the pier and outfall drainage works, and tidal reservoirs for the Ship Hotel drainage, convincing evidence was afforded of the open porous nature of the soil, charged with water, increasing remarkably in volume after rains from the high ground behind.

The remarkable success achieved by Mr. Peter Barlow, with his small iron foot-subway west of the Tower, again shows how fickle are the surroundings of these works, and it has been quoted at times in support of projects whose surroundings are totally different. Mr. Barlow's tube passed through solid blue London clay, very much as a cheese-taster passes through a ripe "Stilton," and was, as the "navvies" say as regards excavation, as "tight as a bottle."

Encouraged by its success, powers were recently sought for a carriage-way tunnel by enlarging the "Tower Subway," and the scheme had well-known responsible supporters, but the mechanical lifts, or at least the disposition of them, wrecked this seemingly taking project, for, on the Middlesex side, a very large area of Great Tower Hill was absorbed, coincident with the frontage of Myers's warehouses, impinging on and rising above the roadway level north-west of the Tower moat, and abutting on what must become a great line of traffic from the end of the new Tower Street across Trinity Square to the Docks. This undoubtedly proved fatal to the project as interfering with its development, besides almost sealing up the approaches to a lofty stack of warehouses and vaults, and taking a large part of the last, in which the late Mr. Myers, the well-known contractor, had invested a fortune. The practical difficulty with mechanical lifts appears to be this—how would a timber wain and long team of horses be accommodated, and such vehicles as sugar-waggons, brewers' drays, &c.? Though the same difficulty, in a minor degree, applies to ferry-boats; but

it really is these exceptional vehicles and teams that would be most likely to avail themselves of a short and practical crossing place.

Proceeding down the river, the first site that presents itself with any reasonable prospect of reaching the arterial lines of traffic on either bank is the Nightingale Lane site, a narrow (only 30 feet including footpaths) and by no means straight road between the boundary walls of the St. Katharine Docks on the west, and the London Docks on the east side, more than a quarter of a mile in length, and leading from Wapping, or Lower East Smithfield, just west of the upper disused Hermitage entrance lock of the London Docks, up to the main entrance gates to the London Docks in Upper East Smithfield. On the Surrey side it would be near Dockhead, Bermondsey, a favourable point for communicating with the main lines of traffic. This is the site chosen for a tunnel by the Metropolitan Board of Works, and if the idea of a bridge between the Tower and St. Katharine's Docks, with connection with the broad main avenue (the Minories), leading up the east side of the City, and connecting with the Aldgate approach into Essex, be abandoned (but not otherwise) it is, all things considered, a favourable site; but it must be remembered that it is only five hundred yards, or about one-third of a mile, lower down than the much-contested site just east of the Tower.

Owing to the insulation of the Wapping neighbourhood by the London Dock basins, there is no convenient site for a tunnel or ferry for three-quarters of a mile further down, until near the site of Brunel's Tunnel, showing his sagacity in its selection; and also near the steam-ferry recently opened, and still more recently closed.

Old Gravel Lane on the north side, leading to Ratcliffe Highway, and the projecting northern bend of the Lower Deptford Road on the Surrey side, might be approached with new inclined streets of approach within a moderate distance, and, either for a tunnel or ferry, the site is a fairly good one. It would also involve passing under the inner lock or cut of the London Docks. By crossing lower down, as proposed by Mr. Dunch, a site might, however, be selected for a vehicular tunnel, avoiding any crossing of dock property, being just east of the London Docks and west of the Surrey Commercial Docks.

Three-quarters of a mile lower, at Ratcliffe Cross, an admirable site for a foot-subway or ferry presents itself from its propinquity to the Stepney Station of the Great Eastern Railway system, and with the neighbourhood surrounding, and interlaced by the Surrey and Commercial Docks, Rotherhithe, our main entrepôt for timber and grain.

Two and a half miles lower we have the Greenwich site (at present a ferry by steamboats); and from  $1\frac{1}{4}$  to 2 miles still lower, the Blackwall and East Greenwich site at Lea Ness, or Blackwall Point. The feasibility of constructing here a carriage-way tunnel, with long approach roads, at an easy gradient for vehicular traffic, has been discussed for many years, from the transparent fact that it is the first site below London Bridge at which such approaches could be attained at anything but a fabulous outlay; and again its claims are great, arising from the fact that, on the north side, the property required from Blackwall Stairs to the East India Dock Road, east of Poplar Church, is of a very inferior character; and, that on the south side, across Bugsby's and Greenwich Marshes, to the Greenwich and Woolwich Road, opposite the workhouse, is almost entirely open land; but unless time be taken by the forelock, this will soon cease, as the promontory has recently been divided by the South Metropolitan Gas Company for a southern Beckton, and the South-Eastern Railway for a now somewhat visionary wet dock.

Mr. W. H. Barlow, F.R.S., the well-known engineer, at the instance of Mr. Richardson, of the Greenwich Board of Works, who has for so long advocated this site, examined and reported on the formation of a carriage-way tunnel for two lines of vehicles and footways as far back as the year 1874. It was urged at the time that here every facility existed for two main north and south arterial thoroughfares parallel to the river, viz., the East India Dock Road on the northern Middlesex side, and the Lower Woolwich Road on the southern Kentish side, presented themselves, which connected, would form a new road or highway between these important home counties; and it was urged that, as a line of new road between the South Metropolitan Gas Company's eastern portion of the East Greenwich peninsula, and that of the South-Eastern East Greenwich Dock project on the western side, had been adopted by these two corporate bodies, the approach to the tunnel might be carried under it. But the necessity again of passing under the entrance locks of such docks appeared to be lost sight of. The land cleared on the north side by the Poplar Board of Works would have been admirably adapted—with a rearranged plan for artisans' buildings—for a north-west line of approach, and the necessary distance would have been afforded for an easy gradient to the eastern side of Poplar churchyard.

Another special feature of this site is that a large proportion of the works would be in clay, which is found at a reasonable depth on either side of the river, and is doubtless continuous under the river bed.

This in effect will prove the touchstone of success as regards

tunnels for vehicular traffic, or smaller subways for foot traffic alone—*i.e.*, whether at the site proposed within reasonable depth clay is met with, or whether it presents only for a great distance below the river bed the alluvium of the river valley covering the London clay. The difference means comparative ease of execution at a reasonable expense, or, on the other hand, a complex and difficult engineering work, at a proportionately enhanced rate of outlay. The question is, in effect, as much a geological one as it is a mechanical study, and the judicious selection of sites—bearing in mind this great variability of the London basin along the line of the river—means the avoidance of excessive expenditure, coupled in some cases with absolute disappointment.

As regards the surcharged traffic over London Bridge, viewed as a separate question, the greatest relief to it would be effected by a bridge between Blackfriars and Southwark Bridges, opposite the eastern side of St. Paul's Churchyard; this I have for some years advocated. It was also proposed by Mr. Bennoch some twenty years back.

Shortly stated its claims are these, *viz.*:—The diversion of the northern traffic to the southward and eastward by avoiding the choked-up City streets. This traffic is quite separate from that flowing over Blackfriars Bridge by Farringdon Street, as it does coming from the higher level of Aldersgate Street and over the Holborn Viaduct, whilst that passing over Blackfriars Bridge is at a level 20 to 30 feet lower, and runs under the Holborn Viaduct. These two north and south streams of traffic are separated from each other by the precipitous Ludgate Hill, with approaches of 1 in 24.

The traffic over a St. Paul's Bridge would be essentially from north and north-west to south and south-east, and would represent a large fraction of what now passes over London Bridge, with a Surrey approach of 1 in 20½ to 1 in 35.

Blackfriars Bridge presents two long gradients from the centre of the bridge, north and south, averaging about 1 in 40, and meeting at the centre of the bridge, a long dead pull on either side.

The St. Paul's north approach, for 500 feet from St. Paul's Churchyard to Queen Victoria Street, would descend southward at 1 in 45; thence for 925 feet, to the centre of the bridge, would be level; and after that, for 1,025 feet, to Great Guildford Street (to be raised 4 feet), would descend southward, at 1 in 40; and for 600 feet in continuation to Southwark Street by Great Guildford Street (widened westward) at the rate of 1 in 300. The combined lengths—bridge 850 feet, north approach 1,000 feet, and south approach 1,200 feet, amount to 3,050 feet, or nearly five-eighths of a mile.

A high-level Tower-bridge and approaches would be about double the length, and the cost would be proportionate; *i.e.* at 87 feet 6 inches above high-water from road surface, inducing the necessity of passing over the railways on each side of the river. The viaducts, as warehouses, would, however, lease well. A Tower-bridge would divert the specially north-east and south-east traffic, and would be a great boon to the manufacturing interest of those quarters, but the great relief to the swollen north and south stream would be afforded by the St. Paul's Bridge.

The patent objection to a high-level Tower bridge and its approaches is the great length, so that a large amount of the lateral riparian traffic—which more especially seeks accommodation—would not reach such distant points as the Whitechapel Road, or the Grange Road, Bermondsey; and, consequently, a large proportion of the traffic from the wharves would still take the present route.

It is this convincing objection that has resuscitated the advocacy of mechanical lifts, but to manipulate such a traffic as that to be expected over such a bridge, with long waggons, and longer teams, must, to say the least, be allowed to present all the elements of a very complicated problem.

The approaches to our above-bridge bridges, are, with the bridges which may be termed low-level, from that fact not of extraordinary length, *viz.*:—

Vauxhall	1,680 feet.	Approaches—1 in 30 to 1 in 46
Westminster	1,703 "	1 in 35 to 1 in 56
Waterloo	2,700 "	1 in 31 to 1 in 42
		(Middlesex side level).
Blackfriars	1,783 "	1 in 32 to 1 in 48
Southwark	1,990 "	1 in 15 to 1 in 40
		(recently improved).
London	1,930 "	1 in 21 to 1 in 100
St. Paul's site	3,050 "	1 in 40 to 1 in 300
Tower high-level site	7,550 "	1 in 40 to 1 in 80

From which it will be seen that the St. Paul's length is only 350 feet greater than Waterloo.

Such are the conditions surrounding what really is a very complex, though, at the same time, an exceedingly popular problem. Will its solution be found in what has been last put forward under authority. Will it attain the "El Dorado?" or, as a *Times* leader put it, is the land of Beulah to be found beneath the Thames at Nightingale Lane—sweet sounding cognomen of a tortuous and narrow thoroughfare. The proposed approach would, however, do away with all this, but an incline of 1 in 25 for over 2,000 feet is

somewhat serious. The steep part of Waterloo Bridge, Surrey approach, at 1 in 31 to 1 in 35 is about half the length. The same remark applies to the steep approaches to the "Iron Bridge" over Bow Creek.

Should powers be obtained for such a work on this site—should it be carried into effect—and, above all, should the traffic be conducted by steep approaches or mechanical lifts without let or hindrance, to the satisfaction of the public; and, above all, to that of contractors for team labour, the tunnel has gained the day, and that at Blackwall may quickly follow.

Pending such a solution, would not the establishment of interim ferries at the sites, or some of them now indicated, be a reasonable concession to what is, no doubt, a pressing public demand—assuming always that such ferries, like the mechanical lifts, are of a nature to avoid the possibility of break down, and of so simple a character that interruption to the traffic would be avoided? This appears to be proposed by the Metropolitan Board of Works at Stepney, Greenwich, and Woolwich.

These remarks are offered as possibly suggestive of discussion to illustrate the bearings of a modern metropolitan want.

It may occur to some minds that a defined plan for overcoming the difficulties surrounding this question might be put forward, but no attempt to do this has been essayed, from the fact that this is purely a metropolitan question, to be dealt with by the authorities who alone have the power of raising the necessary funds from the pockets of the ratepayers, for no toll-bridge or tunnel can be thought of at the present day, though ferries may, perhaps, be expected, as of a more temporary character, and for these, at frequent points, the metropolitan pedestrian would doubtless willingly pay a small toll; but the Metropolitan Board of Works having freed all the toll bridges, it is extremely improbable they will ever attempt to renew or perpetuate so obnoxious an impost for the maintenance of such colossal works as high-level bridges, or deep sub-aqueous tunnels.

I have the opportunity of exhibiting, through the liberality of the authors, various models, showing how diverse has been the treatment of the subject, and the ingenuity brought to play for the solution of the difficult demand for interchange between the river banks without hindrance to navigation.

The Duplex bridge by Mr. Barnett, with an oval double road at the centre, alternately opening so as to have one road open at all times whilst a vessel is passing; the same idea is to be found in the House of Commons report of 1793.

A low-level opening swing bridge, by Mr. George B. Rennie, the leaves of several spans moving simultaneously so as to leave 200 feet free waterway, equal to that between the port tier moorings.

A rolling tray roadway on isolated piers, leaving always a majority of the spans open to navigation, by Mr. George Barclay Bruce, jun.

The Bascule bridge with lifting girders, by Mr. Horace Jones, similar in principle to those met with in the Low Countries, and to be seen on the canvases of the old Flemish painters.

An iron bridge on this principle was erected across the river Ouse for the Hull and Selby Railway, at Selby, in Yorkshire; and one was erected across the north end of the haven of Great Yarmouth—where it joins Breydon Lake—a few years back.

The plan for the high-level Tower bridge, with road surface 100 feet above high water, necessitates passing over the Great Eastern and South-Eastern systems, but the inclined approaches are no longer than had they started from the margins; but the entire length is rendered very great, and the junction with arterial lines of traffic far distant. The same remark applies to the East Greenwich tunnel, and both have been prepared with the object of showing how serious is the question of obtaining convenient and gentle approaches.

An ingenious combination of swing bridge and tunnel has been proposed by Messrs. Kinipple & Morris; this would involve descending from the upper roadway to the lower tunnel surface on one side, and reascending on the other side at periods when the navigable span was open, so that the road traffic would never be interrupted, or the river navigation either. But here, as with the high-level bridge, or with the tunnel, we are met with the same difficulty of accommodating long wains and waggons, and longer teams, on the mechanical lifting trays prepared for their reception, circumscribed, as they would be in this case, by the horizontal sectional area of the two bridge piers.

The various authors of these ingenious designs, who have so liberally lent their models, will doubtless add to the obligation incurred, by explaining *viva voce* what they conceive to be the special merits of their inventions.

It may be added here that Captain Douglas Galton, R.E., and Mr. Armstrong proposed a single and double swing bridge.

An old heathen proverb, *vox populi vox dei*, reverently interpreted the expressed and fulfilled will of the people as providential in character. Is the "Thames Communication" question of this nature? If so, the sooner it is met the better, by a low-level bridge east of the Tower, or a tunnel at Nightingale Lane, nearly opposite Cherry Garden Stairs, names redolent of the past rather than the present, to be followed, say, by a Blackwall tunnel with southern approach across the euphonious "Bugsby's" marshes.

### Competitions Memorial Committee.

SIR,—It will we hope be of some interest to the profession to learn that up to the present time upwards of 1,350 signatures have been received to the undertaking, "not to take part in any public architectural competition unless an assessor or assessors of established reputation are appointed to advise on the designs sent in." We have naturally had several points raised by architects practising throughout the country, in consequence of the Committee's appeal, though they heartily agree with the reform desired; and our object is to ask you to allow us to state the chief of these, and the views of our Committee upon them.

1st. The objection of "trades' unionism" is one which may be urged against all combinations; but without some joint action of this sort no great reform could be carried out.

2nd. The natural fear expressed by some architects, more especially by those out of London, that they may by binding themselves give an undue advantage to those who do not, should, we venture to think, be an additional reason for each individual to join, as without a considerable amount of unanimity, success in the direction we are aiming at cannot be assured; but if this support is given, the public will in a short time find that their best interests are served by complying with so reasonable a requirement.

3rd. It is said by some that they are not interested, as they do not compete. We ask them, however, to aid those who *do*, in removing what has long been felt to be a scandal in the profession.

4th. It is said that competitions decided by professional assessors are not always satisfactory. But even if this be so, it surely goes no way to prove that it is not a considerable step in the right direction.

5th. The Committee have been asked what course we propose to take in reference to the double competition system. We reply that, beyond suggesting that we consider it should not be adopted for work under 20,000*l.*, we think it is beyond our province to express any opinion.

6th. We do not propose to recommend any architect as a professional referee, our duties being confined to sending to promoters of any impending competition the "Suggestions for the Conduct of Architectural Competitions," issued by the Royal Institute of British Architects, and strong recommendations to appoint at once a professional assessor most competent to advise upon the proposed work, and stating the advantages of such a course to the public, and drawing attention at the same time to the list of those who will not compete unless this is done.

Any request made to the Committee for the appointment of an assessor will be referred back to the promoters, with the suggestion that application be made to the President and Council of the Royal Institute of British Architects, or to any well-known architect who would have the confidence of the profession, not necessarily a member of the Royal Institute of British Architects, and who is not competing.

This, Sir, we think, deals with most of the points that have been raised, and, in conclusion, we beg to thank you for the great aid you have rendered to this movement, and express a hope that those who previously signed the memorial and others who have been waiting to have a further expression of our views, will now with as little delay as possible sign the form which has been sent to them, or apply to us for one, which we shall be happy to send, and do whatever else may be in our power.

We may add that we hope to be very materially assisted in our labours by the appointment of local honorary secretaries in all the principal centres throughout the country, many of whom have already agreed to act, and who will place themselves in communication with us and endeavour in all possible ways to promote the desired reform.

We are, Sir, your obedient servants,

(Signed) { HENRY CURREY, Chairman.  
COLE A. ADAMS, } Hon. Secs.  
ASTON WEBB, }

### Conference Meeting of Associates, Royal Institute of British Architects.

SIR,—The Council of the Royal Institute of British Architects having granted the use of the meeting-room, at 9 Conduit Street, for a special meeting of the Associates on Wednesday, May 7, at 4 P.M., as a part of the proceedings of the forthcoming Conference, I should be much obliged if you would allow me to state in your columns that I shall be glad to receive communications from Associates on any subjects of interest to that meeting.

I am, &c.,

G. RICHARDS JULIAN,

Hon. Sec., Associates' Conference Meeting.

8 Delahay Street, Westminster, S.W.

### WORKS IN PROGRESS.

**Parquet Floors.**—Mr. J. F. Ebner's system has been used in several of the new houses at Kensington Court. The cubes are cut from sawn slabs, in such a way as to produce rough edges to form a "key" for the mastic. The system has been lately employed at the following buildings:—Middlesex Hospital extension; Aston Parish Church, Birmingham; two chapels, Tooting Cemetery, for the Lambeth Burial Board; Liberal Club, Charing Cross; Westerham Church, Kent; St. Mary's Church, Dallington, Northampton; Welsh Wesleyan Chapel, City Road; premises in High Holborn, for Mr. G. A. Kino; Priest Hill, Old Windsor; London and Westminster Bank, Brompton Road; Alliance Bank, Regent Street; Nutfield Church; Great Wymondeley Church; Gaslight and Coke Company; Valve House, Horseferry Road; Southover Hall, Ticehurst, Sussex; Royal York Turkish and Electric Baths; residence of the Empress Eugénie.

**Turkish Bath for Horses.**—The Great Northern Railway Company are now erecting a Turkish bath for horses at their Horse Hospital, Totteridge. It consists of three rooms. There is a large wash-room or grooming-room, which leads to the first hot-room or tepidarium, which is at a temperature of 140 to 150 degs. Fahr. From this room the horse, after being thoroughly acclimatised, can if necessary pass on to the hottest room, or calidarium, ranging from 160 to 170 degs. Fahr., and without any turning round can pass on into the grooming and washing-room again. This last room is slightly heated from the two other rooms, and in each are stocks in which the animal can be fastened if required. The heating is done most economically by Constantine's convoluted stove, and thorough ventilation is secured from the large volume of hot air constantly supplied, which passes through the baths, while the vitiated air is drawn off by specially designed outlets. The wash-room is supplied with hot and cold water, which can of course be mixed to any required temperature. It may here be mentioned that Messrs. Pickford & Co., the carriers, have had a similar bath in operation for over eleven years in their Horse Hospital at Finchley. It is in use for three days every week, during which time twenty horses on an average are sent to the bath. It is surprising that there are not more carriers and horse owners who employ the Turkish bath in connection with their establishments.

**Wood Block Floors.**—The improved wood block flooring on Mr. Roger L. Lowe's system has been laid down lately in several new buildings. Among others are the following:—The Cambridge Free Library, the new Drill Hall (Glasgow), Meltham Mills (near Huddersfield), St. Mary's Church (Flint), at Workhouse Infirmary (Chatham), at Grazeley Court (near Reading), Woodhouse (Stanstead, Essex), Hampden House Residential Club (Somerstown), West Cliff Church (Whitby), Wakefield Court House, Werrington Church, Sunday School (Hampstead), school at Cardiff, Vestry (Culvert Darwen), schools at Oxford, houses (Burghill, Charlton Rings, Cheltenham), almshouses at Kendal, Beckett's Hospital (Barnsley), fitting shop (London Road, Manchester). The floors will consist of blocks bedded in patent composition, and laid with close joints on finely-finished concrete. By this means dry rot and loosening are avoided.

### CHURCH BUILDING AND RESTORATION.

**Bagshot.**—A church erected from the designs of Mr. Henry A. Cheers, of Teddington, has been opened. The church is designed in Geometric style, and cruciform in plan, consisting of nave, aisles, north and south transepts, chancel, organ chamber, and choir and clergy vestries.

**Bromsgrove.**—A Wesleyan chapel erected in New Road has been opened. The building has been erected from the designs of Mr. T. J. Yates, architect, Colmore Row, Birmingham. It is a spacious building, with sittings on the floor for 350 persons, and in the gallery for 130—480 in all. There is also a commodious gallery for organ and choir, and in the front there is a spacious porch and bell turret. At the rear are two vestries and a school-room with accommodation for 300 children. The buildings have been erected by Mr. Joseph Tilt, contractor, Bromsgrove, the stone work being executed by Mr. W. Griffin, Bromsgrove. The internal fittings are by Mr. Mead, Sparkbrook, Birmingham.

**Caldmore.**—The memorial-stones of a new Primitive Methodist chapel, Caldmore, have been laid. The building has been designed by Mr. H. E. Lavender, architect, and is being erected by Mr. A. Lynex, Walsall. It is to be of red brick, relieved by moulded strings, pilaster, &c., and will be supplemented with a vestry at the back. The main building will be used both as a chapel and school, and will seat about 150 persons.

**Highbrook.**—The foundation-stone of a new church has been laid at Highbrook, near West Hoathley and Hayward's Heath. The building is designed by Messrs. Carpenter & Ingelow, of Carlton Chambers, Regent Street, and will be in the Early Decorated style. It is to consist of nave, north aisle, chancel, tower and spire, clergy vestry and choir vestry, with a fine porch at the south entrance. The aisle and nave will be divided by an arcade

in three bays, supported by octagonal pillars. The church will be constructed of sandstone, lined with red brick on the inside and finished with stucco. The roof is to be covered with local tiles with crested ridge, and the spire, which is to be of timber, will be covered with oak shingles. There will be traceried windows of a geometrical pattern. The contract price for the building, exclusive of chancel fittings, pulpit, font, and organ, is between 4,000*l.* and 5,000*l.* The builder is Mr. G. Box, of Ardingly, Hayward's Heath, and the clerk of the works is Mr. W. T. Creed.

**Hither Green, Lewisham.**—On Saturday, April 26, the Earl of Dartmouth laid the foundation-stone of the first portion of a new church. The plan of the church is cruciform, with the transepts opening into the choir; extending eastward from the chancel is a morning chapel, which is planned as a church in miniature, with nave, chancel, &c. Owing to the slope of the ground from west to east this morning chapel is so placed that an east window is arranged for in the chancel of the main church. The communication between the church and the morning chapel is by a broad flight of steps from each transept leading into an ante-chapel, and thence into the chapel itself. It has been decided to build this part of the church first, as, by an outlay of about 1,200*l.*, a complete church is provided for a congregation of 300, and to provide similar accommodation by building the chancel and part of the nave three times that sum must be expended. The architect is Mr. Ernest Newton, of Hart Street, Bloomsbury, from whose designs the whole building will be carried out as soon as funds are forthcoming.

**Nelson.**—The foundation-stone of a new Congregational chapel at Nelson has been laid. The chapel will seat about 650 persons, and is expected to cost about 3,000*l.* The building will be a handsome structure, faced with stone. Mr. Fell, of 37 Spring Gardens, Manchester, is the architect.

**Welbourn.**—The parish church of St. Chad, Welbourn, has been reopened after restoration. The building consists of tower and spire, nave, aisles, south porch, and chancel. The tower is the oldest part, and has traces of Early English workmanship. The spire is one of the Decorated period, as also the aisle and lower storey of the nave. The work has been carried out by Mr. S. Sherwin, contractor, Boston, under the direction of Mr. Kirk, architect, Sleaford.

**Wimbledon.**—A new Congregational church was opened at Wimbledon on April 11. The spire is 140 feet in height, and forms a prominent feature in the neighbourhood. The building, which is of Godalming stone facings, with Bath stone dressings, has been erected from a design by Mr. W. D. Church, of 12 South Place, Finsbury. Mr. E. C. Ackermann, of Wimbledon, was the builder, and the cost will be about 6,000*l.*, including extras and fittings.

## NEW BUILDINGS.

**Brighton.**—A block of buildings is now on the point of completion, forming an extension of the Orleans Residential Club. The extensions have been designed in Queen Anne style, and carried out at a cost, including the site, of more than 40,000*l.* The accommodation includes a large billiard-room on the ground floor, a dining-room (general) on the one-pair floor, several private dining and sitting-rooms, smoking-room, reading-rooms, and a large number of bedrooms. The building is arranged on seven floors, the whole of which are reached by a commodious hydraulic passenger lift. There is also a second hydraulic lift for the general service. The exterior, including the bricks, is of terra-cotta, manufactured by the James Terra-cotta Company and by Messrs. Doulton & Co. The architects are Messrs. Lainson & Son, and the building has been erected under their superintendence by Mr. James Barnes, of Brighton.

**Loughton.**—On the extinction of certain ancient rights in Epping Forest, a sum of 7,000*l.* as compensation was awarded to the inhabitants of Loughton. Out of this sum a public hall has just been opened, erected by Mr. Egan, builder, of Buckhurst Hill, whose tender for the job amounted to 2,736*l.* The architect is Mr. Edmond Egan, A.R.I.B.A., of Loughton. The hall is a plain building in the Elizabethan style of architecture. There are two entrances. On the ground floor is a reading-room, a small hall, a library and committee-room, and three rooms for the caretaker, together with lavatories. On the upper floor there is a large assembly-room capable of seating between 400 and 500 persons. The building is of yellow stock bricks, with red brick and terra-cotta dressings. There is a tower over the principal entrance.

**Milford.**—The convalescent hospital erected at Milford, near Stafford, to the memory of the late Sister Dora, of Walsall, has been opened. The building is a plain substantial one of red brick. On the ground floor there is a dormitory for male patients, affording accommodation for seven or eight beds, with lavatory, &c. belonging, general dining-room, matron's parlour, kitchen, scullery, store-room, larder, and other offices. On the upper floor is a ward for seven or eight female patients and children, also with lavatory and other offices; a sitting-room for the female patients, matron's bedroom, two other bedrooms, and linen closet. The building has

been erected at a cost of about 2,000*l.* by Messrs. Treasure & Son, of Shrewsbury, from plans prepared by Mr. E. H. Martineau, architect, of London, who gave his professional services gratuitously.

**Sailors' Home, Leith.**—This building, which has been erected from the designs of Mr. C. S. Johnston, of Edinburgh, is almost complete. The style adopted is Scottish Baronial. The principal frontage measures 90 feet, and is four storeys high, exclusive of attics. The lower is 75 feet high, giving a fine view of the Firth of Forth. The reading-room is 21 feet by 19 feet, the recreation-room 23 feet by 18 feet, the dining-room 32 feet by 18 feet, and the kitchen 22 feet by 18 feet. There are several bedrooms, and four large dormitories. The walls are faced with Polmaise light-brown dressed sandstone, and square-dressed white Harle's rubble. The contractors are Messrs. George Smith & Son. The building will cost 8,600*l.*, exclusive of furniture.

## GENERAL.

**Professor Jebb**, of Glasgow, has been elected a corresponding member of the Berlin Archæological Institute.

**The Art Exhibition at Rugby School** has been closed. The collection of pictures included a series of over seventy works in oil and water-colours by W. Edward Dighton (1822-1853), the pupil and friend of Müller. A series of mosaics in glass and coloured marbles were contributed by Messrs. H. Burke & Co., of London, to the same exhibition.

**The Local Board for the District of Melksham** have appointed Mr. David Mackenzie, C.E., Melksham (Wilts.), as the engineer for the new sewer drains proposed to be laid down in the principal parts of the town.

**Mr. T. Chatfield Clarke** read a paper on "Improved Dwellings for Labourers and Artisans" at the meeting of the Surveyors' Institution on Monday last. There will be a discussion on the subject on next Monday evening.

**The First Prize** in the competition for the Wesleyan church at West Cliff, Scarborough, has been awarded to Messrs. W. J. Morley, of Bradford, and G. H. Woodhouse, of Bolton. Mr. John Hall, of Scarborough, obtained the second prize. There were sixty-four competitors.

**The Windows** on the south side of St. Luke's Church, Torquay, five in number, have been filled with stained glass in memory of Colonel and Lady Laura Meyrick, and Lady Alvanley. Messrs. Heaton, Butler & Bayne, of London, were the artists.

**A Committee** of the Swansea Corporation have decided to select the designs marked "Goreu Doniau Gwybodaeth," "Morganwg," "Utile Dulci," and "Con Amore," subject to the approval of the Council. The President of the Royal Institute of British Architects has been asked to name some architects to examine the four designs, and decide which is the most eligible.

**City and Guilds of London Institute.**—At the meeting of the executive committee of this Institute, held on Monday, the following appointments were made at the Central Institution, Exhibition Road:—To the Professorship of Chemistry, Henry Armstrong, Ph.D., F.R.S., of the Technical College, Finsbury; to the Professorship of Engineering, W. C. Unwin, B.Sc., of the Royal Engineering College, Cooper's Hill; to the Professorship of Mechanics and Mathematics, Olaus Henrici, Ph.D., F.R.S., of University College, London; to the Professorship of Physics, Oliver Lodge, D.Sc., of University College, Liverpool.

**A Lunatic Asylum** on a large scale, to provide for between 800 and 1,000 patients, is proposed to be erected in the Glasgow district. A committee of the Lunacy Board have recommended the erection of blocks to be used for hospital purposes, capable of accommodating between 250 and 300 patients; central buildings, containing everything requisite for the general administration of the whole establishment, and having also accommodation in suitable sized blocks, capable of ultimate extension, to accommodate at least 600 patients—the whole blocks being connected with one another by corridors or covered ways.

**Society of Antiquaries of London.**—On St. George's Day this society held its annual meeting for the purpose of electing its officers for the ensuing year. Lord Carnarvon was re-elected president, and Mr. William Copeland Borlase, M.P., and Mr. William Smith, LL.D., D.C.L., were chosen vice-presidents. Mr. Charles Spencer Perceval, LL.D., was elected treasurer, and Mr. Henry S. Milman, M.A., director. Mr. Charles Knight Watson, M.A., was re-elected secretary.

**A Bill** to authorise the construction of an electric railway in London has been before the House of Commons. It proposed to start from a junction with a line to Waterloo Station, already authorised, at Trafalgar Square, and go to Dudley Street, St. Giles's, from which point a line was to be carried by George Street, Bloomsbury Street, New Oxford Street, Snow Hill, Holborn Viaduct, and Newgate Street to St. Martin's-le-Grand. The estimated cost was 395,000*l.* The Committee rejected the Bill.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

bridge Stations, Surrey.

# BELL'S ASBESTOS.

## BELL'S ASBESTOS FLOORING FELT.

This article is manufactured from specially prepared Asbestos fibre, and by its use any building can be rendered comparatively fireproof at a very small cost. This material should be used as a substitute for brown paper under the carpet, and it can be taken up and relaid as often as required; it may be laid between the flooring boards, on the ceiling before plastering, and on the walls. Doors of pine or other wood should be so constructed as to have a sheet of the felt in the centre, so that either side being burned the other remains intact. In houses so protected fires would be localised to the rooms in which they originate. Asbestos felt, being a non-conductor of heat, is superior to any other sheathing, and used under slates has no equal. It yields no dust, lies quite flat, is soft to the tread, and its low cost places it within the reach of everybody. Made in rolls of 36 inches wide.

**BELL'S ASBESTOS BOILER AND PIPE COVERING COMPOSITION** for coating every class of steam pipe and boiler. Non-combustible, and easily applied when steam is up; adheres to metals and preserves them from rust; prevents the unequal expansion and contraction of boilers exposed to weather; covers 50 per cent. more surface than any other coating, and is absolutely indestructible. It can be stripped off after many years' use, mixed up again with 20 per cent. of fresh, and applied again. The composition is supplied dry, and only requires to be mixed with water to the consistency required for use.

A horizontal boiler, 17 ft. 6 in. long, 15 H.P., gave the following results:—

Temperature on Plates .. .. .	186 deg.
"          Covering .. .. .	94 "

One ton of coal was saved per week, and, although the fire was raked out every evening 20 lbs. of steam were in the boiler next morning.

The following testimonial refers to this covering:—

Offices of Wimbledon Local Board, Wimbledon, Nov. 28th, 1883.  
Dear Sir.—It may interest you to know that we save exactly 40 per cent. in fuel through using your covering.—Yours truly,  
W. SANTO CRIMP, C.E., F.G.S.

**BELL'S ASBESTOS PAINT**, for floors, stairs, and all interior woodwork, to prevent the spread of fire. This paint is especially useful in cotton mills, and in fact in all factories and buildings exposed to risk from fire. It is quite free from poisonous ingredients, and is both easily and cheaply applied. Bell's Asbestos Paint has, on several occasions, done great service in preventing the loss of life and property. The great fire in Buchanan Street, Glasgow, in November last, produced the following testimony to the value of this material:—

Offices of the *Glasgow Herald*, the *Weekly Herald*, and the *Evening Times*.

Mr. John Bell, Glasgow, Nov. 14th, 1883.  
Sir,—As one of the means that helped to save our buildings extending from Buchanan Street to Mitchell Street from the recent great fire, I think it fair to say that your Asbestos Paint, which was applied to the outside hoist of the *Evening Times* case-room and other portions, gave valuable proof that it materially aided in resisting the flames from the immediately adjoining tenement while the fire was rapidly destroying it and threatening us in the most serious form. Since the fire, and to assure myself further of the value of the Asbestos Paint as a fire-resister, I placed a piece of wood, with your paint put on more correctly than in our case, into one of our furnaces, with the result that it was brought out without a fibre of the wood being touched, while similar pieces of wood, thrice coated with Irish Lime, at once got into a flame.—Yours truly,  
(Signed) ALEX. SINCLAIR.

**BELL'S ASBESTOS SASH-LINE CORD** is unaffected by heat and damp, and renders unnecessary the use of metallic wire and chains. Ropes made in the same form have great tensile strength, and being indestructible by fire are of incalculable value for fire escapes.

## BELL'S ASBESTOS.

The goods of this house are of the highest quality only, and no attempt is made to compete with other Manufacturers by the supply of inferior materials at low prices. All orders must be sent direct to the undermentioned depots, and not through agents or factors.

**BELL'S ASBESTOS AND INDIA-RUBBER WOVEN TAPE AND SHEETING** for making every class of steam and water joint. It can be bent by hand to the form required, without puckering, and is especially useful in making joints of man-hole and mud-hole doors on boilers; also for large "still" joints, where boiling fat and steam have to be resisted. It is kept in stock in rolls of 100 feet, from 1/4-in. to 3-in. wide, and any thickness from 1/8 in. upwards. Manhole covers can be lifted many times before the renewal of the jointing material is necessary. The same material is made up into sheets about 40 in. square, and each sheet bears the trade mark, without which none is genuine. It is very necessary to guard against imitations of this useful material, and to secure themselves against being supplied with these less useful articles at my price, users are recommended to see that every 10-ft. length of the Asbestos Tape purchased by them bears the trade mark.

**BELL'S ASBESTOS CEMENT** for the backing of firebricks and furnaces. The use of this fireproof material saves the expense and annoyance occasioned by the repairs so constantly required in the firebricks and kitchen ranges of private houses. Any labourer accustomed to handle other cements can apply this.

**BELL'S ASBESTOS BOILER PRESERVATIVE**.—This useful mixture, by absorbing the free oxygen that is in the water, entirely checks pitting and corrosion. It also disintegrates incrustation so immediately as to prevent its adhering to the plates. Not only is a great economy of fuel effected by keeping boilers clean, but the risk of having the plates burned is thereby obviated. It has been computed that 1-16th inch thick of incrustation causes a waste of 15 per cent. of coal; 1/8 inch thick, 60 per cent.; and 1/4 inch, 150 per cent. Thus the Preservative avoids the great risks which are inseparable from scaled plates, lengthens the life of a boiler, and covers its own cost a hundredfold by economy of fuel. It is entirely harmless, and has no injurious action on metals. It can be put into the feed tank or boiler, as may be most convenient. Sold in drums and casks bearing the trade mark, without which none is genuine.

**BELL'S PURE ASBESTOS CLOTH**, for protection against the spread of fire. Iron curtains warp, and in the great emergency of fire will often be immovable. Asbestos cloth, being incorruptible, will remain strong and flexible for an indefinite period, and will stay the progress of a fire and the passage of smoke longer than any other known material. This cloth is also extensively used in Maignen's unequalled water filters, for which a gold medal and diploma of honour were awarded by the Special Commission appointed by Her Majesty's Government to receive the reports of the International Juries at the Fisheries Exhibition. By special arrangement with Mr. Maignen, his filters for houses, factories, and towns are supplied by this firm.

**BELL'S ASBESTOS BLOCK GAS FIRES**.—The Asbestos Block Gas Fire is formed by placing inside the ordinary grate a hollow block (burner), composed of Asbestos, and perforated. An iron sole-plate, with a single gas burner, is fixed at the bottom of the block. After being lighted a short time, both the block and asbestos fuel throw out intense heat.

**BELL'S ASBESTOS FUEL** for gas fires. This genuine Asbestos Fuel is composed of the finest hand-picked Asbestos, and its weight is about half that of any other Asbestos fuel.

**BELL'S SPECIAL LONDON-MADE ASBESTOS MILLBOARD**, for dry steam joints, made of the best Asbestos fibre, is well-known for its toughness and purity, and is absolutely free from the injurious ingredients frequently used to obtain an appearance of finish, regardless of the real utility of the material. Made in sheets measuring about 40 in. square, from 1-64th in. to 1 in. and 1/2 millimetre to 25 millimètres thick. Each sheet bears the Trade Mark.

# The Architect.

## ARCHITECTS AND CONTRACTORS: THE QUANTITIES QUESTION AGAIN.

“The duties, obligations, and mutual relations of architect and contractor” we have one of the subjects selected for discussion before the Conference of Architects which has been held during this week; and no doubt there is a great deal to be said in these days upon the whole matter. We might even go so far as to suggest that there is a great deal to be said, as the phrase goes, on both sides; for there are two sides in the case, the contractors being not quite satisfied with what the architects often expect them to do, and the architects being little better pleased sometimes with the contractors’ expectations, and, indeed, artifices.

At first sight, the bargain seems simple enough when a professed builder agrees to build a house, according to a certain plan, for a certain sum of money, and a professed architect, who has designed this plan, agrees to direct and superintend the execution of it. The transaction does not appear to be in any way rendered more difficult when our attention is directed to the circumstance that the builder and the architect are both employed by the same dominant proprietor, who is a *tertium quid* by whose means alone the two operators are brought into the condition of having “duties, obligations, and mutual relations” towards each other. The whole affair, so far, is straightforwardness itself; and in fact to so shrewd an intellect, for instance, as that of a judge of a Court of Law, it is practically out of the range of forensic argument to attempt to show that the business ought to involve any risk of misunderstanding. Here is an experienced contractor, who, with his eyes wide open, enters into a contract; and there is an experienced architect, who, with his eyes wide open also, undertakes to see the contract performed; the one has to do what he has agreed to do, the other has to see that it is done; nothing can be simpler, and there is only one question that can possibly arise, Is the thing done as agreed—yes or no?—a question that a child might answer, and so on. Thus might we suppose a very learned judge to speak, and to wait for an answer which equally learned counsel would fail to supply.

But if there is one thing more than another in which the current somehow never will run smooth, it is this very practice of building a house according to the plan of an architect, and under his direction. It is a significant circumstance that the first builder in this world is said to have been CAIN. No doubt that objectionable patriarch was, in modern terms, his own contractor, his own architect, his own quantity-surveyor, and, so to speak, his own employer, so that the complexities attaching to modern undertakings in bricks and mortar may very likely have failed in a great measure to come before him. But, be this as it may, no sooner, we are further told, did building enterprise assert itself on anything like a large scale than disaster marked it for its own, and great Babel’s tower—but why pursue the narrative? It is enough to add that from those days to these, all over the world, building has been the fertile source of a thousand misadventures, and the best laid schemes of architects, contractors, and surveyors have constantly been going awry.

In modern countries of the more advanced commercial character, the rule of strict bargaining has been continually widening its application. Not only does it seem to be the case within one’s own recollection that the practice of settling beforehand the price of everything, however trifling, that is ordered to be done or made, has been acquiring greater force every year; but it cannot be denied that the principle of “speculation” has been obtaining greater recognition amongst producers, and, what is worse, demanding greater recognition still on behalf of consumers. In other words, contractors of all classes, builders emphatically included, have been growing more speculative in their competitive calculations as against

each other; and the agents of employers, architects included, not satisfied with even this, seem to have been encouraging, whether directly or indirectly, the still more ruinous idea (for all speculation is ruinous to the many if profitable to the few) that the employer is entitled to force upon a contractor, by the process of competition of tenders, the acceptance of undetermined and undeterminable “risks.”

The proper “duties, obligations, and mutual relations of architect and contractor” are in theory manifestly these. The contractor, being fully and responsibly informed by the employer upon every item of the work to be done, and having a perfect understanding with the employer as to the quality of that work in every respect, is thus enabled, for the commercial satisfaction of the employer, to inform him fully and responsibly what the price shall be for which the work is to be done honestly and well, and within certain reasonable limits of time, all unforeseen risks to be the employer’s risks. Upon this, in the next place, the architect undertakes to supply to the contractor all requisite directions for the execution of the work as intended, to exercise such control over both parties that the one shall not give too little or the other ask too much, and finally to make up a just account as regards any additional work done beyond the limits of the contract or any work omitted from within the same limits. But the difficulty in practice is how to carry out this equitable scheme, and it is plain that, the more intricate the conditions happen to be, the greater does the difficulty become.

On Tuesday evening last the subject was carefully discussed at a meeting, not large in numbers, but influential in character, and especially comprising a considerable proportion of provincial architects, together with a few representative quantity-surveyors and builders. Suffice it to say that the question, when fairly launched into debate, resolved itself into a single prominent point, namely, Who shall make out the bills of quantities? This, in short, seems to be the chief of all considerations just at present with those who are interested in the proper adjustment of the relations between architects and contracting builders in England; and the fact is soon discovered that provincial men insist upon the architect taking out his own quantities, while London men insist upon his not doing so. Both agree that the employer should be enabled to know beforehand what his expenditure is to be; but the provincials, as we may put the case, reject the speculative element which the Londoners are too ready to encourage. The Londoners say in effect this:—Let the architect refuse all personal responsibility for the price; let the contractor take all speculative risks; and let the quantity-surveyor, because he is a stranger, so to speak, to the transaction otherwise, take upon himself alone the whole burden of the calculation of the bills. The provincials, on the other hand, say this:—Let the contractor be relieved from the speculation risks; let the architect therefore make out the bills of quantities, because he is expressly not a stranger to the transaction otherwise; and let the employer take his chance, on these favourable terms, of being perhaps not quite so well assured beforehand of the cost of his undertaking. To bring the matter to a point, let the bills of quantities be the basis of the contract, and then the individual architect may be his own surveyor or not as he pleases. As one further principle, let the payment for the quantities be received, whether by the architect or by the surveyor, never from the builder, but always from the employer, and so the last suspicion of collusion will disappear. A variety of reports of the custom of foreign countries, which had been collected by Mr. CATES, who opened the discussion, excited a good deal of interest; and the mode followed in the great towns of Scotland was once more described, whereby the work is twice measured up, once before commencement for the tenders, and a second time after completion for the payment; but the perhaps universal opinion of the English architects present was in favour of the English plan, subject to the one reservation above described.

An honest beginning goes far to make a fair ending, and we feel that we cannot too strongly urge upon the profession the abandonment altogether of the system of speculative risks, even as regards the accuracy of the bills of quantities. The plain result of Tuesday’s discussion is that the Institute must give up the dogma that an architect ought to avoid the work of making the bills of quantities; there is nothing in it when fairly tested. The real question turns upon two points, competency and honesty; and to make the quantities the basis of

the contract seems to be all that is further requisite. We do not in any way underrate the commercial value of the quantity-surveyor, especially in large works; but we cannot see the necessity for forcing him upon every architect in the empire as a matter of conventional repute. At the same time, it might be a serious danger if London architects of high standing were to take to the practice of keeping private surveying clerks for the purpose of making their own bills of quantities. But, on the other hand, is it not the fact after all in most cases that the employer, when informed of the function of the quantity-surveyor, who is an entire stranger to him, simply tells the architect to do as he pleases, *because it is upon him, and not upon the stranger, that the responsibility must lie?*

## ARCHITECTURE AT THE ROYAL ACADEMY.

THE number of works included under the heading of Architectural Drawings in the catalogue of the Royal Academy Exhibition for 1884 is 142. But as a considerable number of sketches and studies of old work, some designs for stained glass, and a few competition drawings are counted in, the actual number of drawings representing the architecture of the year is below one hundred. Of the five architects who are Academicians or Associates, two—namely, Mr. BODLEY and Mr. PEARSON—do not exhibit; and the hangers have been so put to it to find works of first-rate importance for the places of honour in this room, that for the first time in our memory both the principal positions are occupied not only by drawings exhibited by one architect, but by drawings representing but one building, and that a private house. We are decidedly of opinion that the present collection is below the average, and that it is not only anything but an encouraging exhibition, but actually a disheartening one, for those who are anxious to see English architecture prosper and make sound progress.

The places of honour to which we have just alluded are allotted to Mr. NORMAN SHAW, R.A., who exhibits in two frames eight drawings of *Dawpool, Cheshire* (1250 and 1302). This is an extensive house on a large scale, shown in pen-and-ink drawings, some geometrical and some in perspective, from the hand of Mr. LETHABY—excellent drawings indeed, though hardly equal to some which that accomplished draughtsman has exhibited in former years. The plan indicates that a large top-lighted picture gallery forms the most prominent single feature in the scheme of the house, and may, indeed, almost be said to be the key to the arrangement of the whole. This gallery has an elliptic ceiling, and across one end of it is thrown an arcade of elliptic arches, forming a screen, and carrying a kind of balcony; while at the opposite end comes a wonderful combination of a cheminée and balcony. The general character of the exterior is Tudor, the windows have mullions and transoms, the gables are not stepped or broken, the chimney-stacks are very massive, and are crowned by twisted shafts, apparently in brick. The style of the interior is something more like Jacobean or late Elizabethan, and one cannot help regretting this want of harmony; nor is it quite easy to reconcile the idea of a lift, which is provided for on the plan, with the diamond quarries in the windows, or the Dennett arches shown on the section, with the general old-world air of the work. Notwithstanding such inconsistencies, there is a great deal of picturesque power in the design of this work, and it will rank among the best examples of its author's skill.

There is a third spot—the centre of the short west wall—where it is usual to hang some drawing which the authorities delight to honour. This position is occupied by a restoration of the famous Temple of Diana at Ephesus (1341), made by Mr. JAMES FERGUSON from the remains discovered by Mr. WOOD. The subject is one which in itself may well command respect, for the discovery of this temple is one of the brightest triumphs yet achieved by archaeological research. The fame of the restorer is great, and the drawing is beautifully executed; but we must demur to Mr. FERGUSON'S mode of solving what is perhaps the most difficult problem presented for solution by the remains unearthed—we allude to the disposition of the *columnæ celatæ*. These are so treated in this restoration that, while some stand on a lofty pedestal, others, forming part of the same series, are carried down to the level of the base of such pedestal, so that two sets of shafts of different lengths stand side by side. We do not believe that the Greeks, even

as late as the time when this wonder of the world was erected, would have considered such an incongruity admissible.

Of drawings on or close to the line, passing over mere studies for the moment, the following may be mentioned:—*St. Mary's Church, Pulford*, by Mr. JOHN DOUGLAS, of Chester (1230). This frame contains two views, in black ink, of a church of geometrical decorated character, with a nave, low transepts, and a large tower almost entirely detached, crowned by pinnacles, and with an octagonal spire of which the faces are unequal. The design, like everything that comes from Mr. DOUGLAS'S pencil, is very masterly, slightly inclined to be florid rather than severe, but singularly successful. *Collingham Gardens*, by Mr. ERNEST GEORGE (1239), shows four vignetted views, remarkable for the power with which they are drawn and tinted, are included in one frame. If they had been labelled "Scenes from Prague and Nuremberg," few persons would have hesitated at accepting the title, so perfectly do the high-pitched roofs and stepped gables, the vast bays, the many dormers, and the segmental-headed window-heads full of brick tracery reproduce German Mediæval domestic architecture. The question, however, will present itself—Is all this, although so well done, the best attempt the author can make at English nineteenth-century domestic architecture? We are unable to bring ourselves to say that it is.

Mr. J. D. SEDDING exhibits a pen-and-ink drawing of a proposed church for Sunbury-on-Thames (1240). The nave of this church is apparently to be built first, and we are shown the arcade built up, with handsome windows inserted in the filling in, which, we may presume, are ultimately intended to figure as aisle windows; meantime, very dwarfed aisles are proposed. There is a central tower, of which the mass is good, but inconsistent with the details, for the window tracery is Late Decorated, while the forms of this tower are much more severe and early than would have been built in the fourteenth century.

Mr. GEORGE AITCHISON, A.R.A., exhibits the front of a London house, 26 St. James's Square (1242), narrow, tall, and executed in red materials. It is of Renaissance architecture of a rather French type, and, though ornate, not very florid. The carving, of which there are several masses, is not as well drawn as Mr. AITCHISON has accustomed us to expect in works exhibited by him. The upper part of this design, gable and chimney-stack, is the most highly ornamental. The whole is a wonderful improvement on an ordinary London façade. Mr. JAMES BROOKS exhibits a drawing of the exterior of the famous and magnificent church which is the pride of the small and remote Gloucestershire town of Northleach, to show a proposed *Restoration* (1246). The church is a fine specimen of Early Perpendicular, with a very lofty south porch, almost forming a transept so massive is it. The restoration of such a building should be in competent hands if it be undertaken at all, and none better than those of Mr. BROOKS could be found. Mr. BLOMFIELD contributes *A New Parish Church for Portsea* (1255). This church differs a little both in style and treatment from Mr. BLOMFIELD'S usual work, and is hardly improved by the difference. It is Early Perpendicular, but with a higher pitched roof than that style usually recognises, and with a west tower rather deficient in mass as seen from the point of view selected for the drawing.

Mr. R. R. ANDERSON is one of the most valuable contributors to the exhibition, since he sends three important buildings, all good. His *Parish Church, Govan* (1254), represents in a very fine drawing a church of lancet architecture, with a conspicuous tower and spire. The effect of the whole is thoroughly telling, but the architect has relied mainly on his steeple for that effect; and were the spire, or, worse still, the tower and spire, to be postponed for economical reasons, as only too often happens with churches, the simple nave and choir would be but a modest substitute for this noble group. Mr. WATERHOUSE, A.R.A., exhibits *The Principal Staircase of Owens College* (1258). It is vaulted, and the central part of the vaulting is carried by long shafts of richly-coloured material, rising out of the balustrade that divides the two flights. The drawing is one that must have been difficult to make; it shows with great success, and in easy perspective, two flights of stairs—the lower one rising towards the spectator, who is supposed to be on, or rather above, the landing, and the upper one receding from him. The staircase does not appear to be an extremely large one, but is a rich and effective feature of a good building. *Sion House, county Tyrone*, as altered, is exhibited by Mr. W. F. UNSWORTH (1262). This drawing shows a large half-timbered structure of some dignity,

with a good deal of verandah round it, the effect of which is rather disturbing to the character of the general mass. There is nothing to indicate what portion has been altered by Mr. UNSWORTH, but whatever it is, the quality of the design seems well maintained throughout.

The new *Presbyterian Church at Richmond* (1265), contributed by Messrs. WALLACE & FLOCKHART, is a tinted drawing of a Gothic building, with lancet windows, and of a good deal of quiet simplicity, the materials being brick and stone. Enormous buttresses project from the west front, and help to enclose the porch, which is less happy than the rest of the building. Two houses at Hampstead, exhibited by Mr. MAY (1275), are a specimen of the kind of design that prevails at Bedford Park. Parts of the building are not without picturesque feeling, especially the bay window that marks a prominent corner, but the entire absence of grouping or composition or order in the greater part of the buildings is painful. Still the house belongs to a type which is often built, and this circumstance furnishes a fair excuse for giving the drawing prominence, but what motive can have induced the hangers to draw attention to the next work we shall have to mention, it is difficult to conjecture. The *Front Door Gable at Collyers* (1280), exhibited by Messrs. BATEMAN & KEATES, is a carefully-drawn tinted elevation of a brick front. On the ground floor are two ordinary window openings, with square brick heads and sash windows, and some ornament in low relief on the brickwork over the heads. Between these comes a kind of porch, with a semicircular opening, and a second arch, not concentric with the outer one, seen within it. The extrados of this arch is strongly marked, and has an ogive form, very slightly pointed. A mass of black and white colour on small diamonds above this forms a singular patch in the front, and above this occurs a tree of conventional foliage supporting a shield. On the first floor occur two round-headed windows, two round-headed arches, and four half-arches, the whole being surmounted by a heavy gable all but blank. Knowing as we do the merit of some of the drawings not accepted, we cannot but feel wonder that this wild vagary has been hung at all, and that it should be where it is seems little short of incomprehensible.

A small and rather rough sketch of the additions to the Cambridge Union Debating Society's building, by Mr. WATERHOUSE (1283) is too small and too slight to do justice to a building of this importance, and we confess we prefer, both as design and as drawing, the *Turner Memorial House* (1296), by the same architect, which hangs near. This is a harmonious, simple, unaffected Gothic building, with a good deal of quiet dignity, and yet extremely plain and modest.

Mr. F. H. OLDHAM contributes his fine design for the *Nottingham Municipal Buildings* (1292), a very successful example of domestic Renaissance, showing much skill in the handling of the masses of a building. A vast tower with a rich summit marks the corner of the composition nearest the spectator, and from it there falls away on either hand a large pile of lofty and extensive buildings, full of variety, skill, and good taste. The additions to Somerhill by Mr. T. H. WATSON (1306) are shown in a beautiful drawing, and seem to be in good keeping with that dignified old English mansion. In this addition a difficult and even dangerous work appears to have been safely completed, for there is no small risk of damaging a first-rate building by any additions.

A very remarkable drawing, showing the interior of the *Chancel of St. Saviour's Church, Belgravia* (1311), exhibited by Mr. ROMAINE-WALKER, is the next prominent example on the line. The subject is not one that perhaps admits of great originality. The centre of the east wall is occupied by a reredos full of sculpture, and a mural arcade fills up the remainder of that wall and returns along the sides of the choir. All this is well designed and with good taste; but the draughtsmanship is much more remarkable than the design, and in our opinion approaches very closely to Mr. STREET's work in value. This is the best executed pen-and-ink drawing in a collection where almost everything that is good is done in pen and ink, and it will well repay the closest scrutiny.

In *Allerton, Cannes* (1314), we meet with the last of Mr. WATERHOUSE's contributions. It represents a moderate-sized house, of which the special feature is an arcaded loggia in two storeys, which fills up the space between two projections, and no doubt will be delightful in the mild climate of that charming winter resort. Some of the other features are a little crowded, but there is a picturesque window which occupies the end

of the house on the spectator's right, and which strikes us as cleverly designed. Passing several good drawings of decorative subjects, including one by Mr. AITCHISON, to which we shall return hereafter, we come to Mr. CHARLES BARRY's design for the new roof over the quadrangle of the Royal Exchange (1335). This roof is partly arched and partly domed. It appears intended for execution in cast iron and glass, and unless we are carried away by the attractions of a beautifully tinted drawing, we must pronounce it to harmonise well with the architecture of the quadrangle. The last drawing on the line which we have to notice is contributed by Mr. J. G. CRACE. It represents suggestions for the coloured decoration of St. Paul's Cathedral (1345). Mr. CRACE's drawing embodies a series of panels of coloured marbles—or painted to imitate them—to occupy the various panelled spaces now left plain, a good many pictures probably intended for execution in mosaic, and a profuse use of gold, apparently with the hope of fusing together and to some extent toning down these various masses of colour. The effect would no doubt be rich, but we doubt if it would be harmonious, and we cannot call this design, which by-the-by is shown by a beautiful drawing, a systematic or complete plan for the decoration of the metropolitan cathedral.

Among the drawings which we have noted, but which cannot this week be described, are contributions by Messrs. A. W. BLOMFIELD, BIRCH, COLCUTT, MAURICE B. ADAMS, BROOKS, BOURCHIER, EDIS, ERNEST GEORGE, E. J. MAY, F. R. KEMPTON, ASTON WEBB, RICARDO, CAWSTON, STENNING, SHERRIN, LEE, ANDERSON, CARÖE, ERNEST NEWTON, PRIOR, GILBERT SCOTT, HEATON, BUTLER and BAYNE, and HUNT, STEWARD, and KNIGHT.

## THE INTERNATIONAL HEALTH EXHIBITION AT SOUTH KENSINGTON.

FROM an exhibitor's point of view the exhibition at South Kensington has proved immensely popular, for although at one time there was a slight fear, we believe, that the building would not be filled, applications flowed in at the last moment to such an extent that, we are informed, five times as much space as the executive had at their command was applied for. Although this set all doubts at rest so far as the well-filled appearance of the buildings went, it placed the various committees in an awkward predicament. Was the quantity of space applied for in each case to be inexorably cut down, or was a wholesale refusal to be carried out, and the "slaughter of the innocents" to be thus effected? The former course was the one generally adopted, and this again brought fresh trouble upon the executive. Letters of complaint poured in from disappointed firms. Some refused to accept the reduced space, and withdrew altogether, while others, wiser in their generation, endeavoured by appealing to the good feelings of the "ruling powers" to obtain a further "dole." In some instances this was successful, but a want of judgment was apparent in numerous cases in the manner in which the reductions were made. We have received many communications from firms who were disappointed, and whose allotted space rendered it impossible for them to carry out their intended exhibit. In some cases the amount offered was so small as to make it impossible to show even one of the articles required. Here the weakness of those appointed to make the allotments was apparent. The mistake made, in our opinion, was that those to whom this task was relegated were not conversant with the materials with which they had to deal. Three or four individuals acquainted with the different manufacturing interests of the country, conversant with the value of the goods made by individual firms, would have settled this vexed question in an easy manner. Firms whose productions were of least moment would have been at once refused, and others, where merit was known to exist, would have had reasonable room allotted to them. We can well understand the desire of many to obtain an *entrée* to the Health Exhibition, which virtually means a shop free of rent and taxes for five or six months, with the certainty of having thousands of visitors daily of all classes—an advantage not attainable except by similar undertakings. But it is too late to offer suggestions now, and we must take the exhibition as we find it. At the time we write, although publicly opened, it is far from being in a complete state; but this backwardness is

more the fault of exhibitors than of the executive. Why is it that exhibitors make such a distinction between at home and abroad? In most foreign exhibitions we have been accustomed to see the English section ready even before that of the nations in which they were held; but at home a sort of *laissez faire* feeling too often takes possession of them and is to be highly reprehended.

The exhibition is composed of two great divisions, the first being named Health and the other Education. It is, however, almost needless to add that the latter division is made to represent the hygienic feature as much as the other. The first-named division is subdivided into several classes, embracing foods of most kinds in their raw, prepared, and cooked forms, dress, the dwelling-house in all its details, ambulance, hygiene of the school and workshop, and meteorology as it applies to the study of public health. Medicines, as they are generally understood, are strictly excluded, the dictum of the executive being that this is a "health" and not an "out-of-health" exhibition. But in some of the prepared foods and dietetics, and even temperance drinks, a critical mind may fairly consider them as medicines in disguise; and in our thinking a very fine line indeed may often divide the two. The second division contains classes ranging over all the appliances of the teacher's art: instruction in domestic economy for girls; elementary training in handicrafts for boys; science and art teaching; the fitting up and conduct of technical and apprenticeship schools; apparatus and examples for teaching the blind, the deaf, and the dumb; school museums. There are one or two objects that the critic may urge has nothing to do with health, the principal one being the old London street, and another the fountain erected by the London water companies, lighted at night by the electric light; but as both of these will form great attractions, particularly the former, and as no doubt a double object has guided the promoters, we are not disposed to cavil with them.

In the old London street we are introduced to a good illustration of Early English domestic and ecclesiastical architecture. This thoroughfare, with its quaint gabled houses and somewhat picturesque shops, is approached at one end by a Gothic archway representing one of the old City gates, Bishopsgate, and at the other end is a church and monastery of Mediæval London. Each of the shops is under the direction of one of the City companies, and various handicrafts when all is in order will be carried on in them, which we shall revert to on a future occasion. Above the arch of Bishopsgate are the arms of the City of London and those of the bishopric, and over the gate in a niche is the statue of Bishop WILLIAM the Norman. Upon the towers that flank the gateway are statues of ALFRED and his son-in-law ELDRED, Earl of Mercia. On the other side of the gate is a statue of St. ERKENWALD, fourth Bishop of London, A.D. 675. A debtor's prison is shown on one side and a "lock up" on the other, both on the ground floor, staircases leading from them to the first floor. The first house through the gateway to the left is the Rose Inn, the front covered with small cut slates, the next house being a correct copy of the original Cock Inn, Leadenhall Street. Very few if any of these old hostelries now remain, except here, and there in very obscure places. In the next block we are introduced to the Three Squirrels, which stood upon the site in Fleet Street now occupied by GOSLINGS' bank. In the ironwork of the Bank windows is still to be seen the sign in question. It is of course generally known that the old London bankers were also goldsmiths, and at the Messrs. CHILD's, close to where Temple Bar stood—the oldest banking-house in London—its sign of the Marigold is still preserved; and HOARES' bank (1693), was familiarly known by its sign of the Golden Bottle. We have now approached ISAAC WALTON's house, a fine specimen of a citizen's house in Queen ELIZABETH's time, and for many years afterwards a conspicuous feature in Fleet Street. Two smaller houses standing back from the main street next arrest our attention. They are two unpretending wooden structures from beside the ancient church of St. Ethelburga, Bishopsgate Street Within. The old tower of All Hallows Staining stands in an adjoining position prominently in advance. The church was called "Stane Church," to distinguish it from others in the City originally built of timber.

We are then taken to the neighbourhood of the Strand, almost within sight of our own office, and introduced to a portion of an old street known as Butcher's Row. This street formed a very narrow one between the rear of St. Clement's,

as Holywell Street was once called, and Ship Yard in the Strand, and, it is almost unnecessary to add, attained its name from being a row of butchers' shambles. It is said that in one of these houses the conspirators of the Gunpowder Plot met to concoct their horrible project. The buildings are represented from original drawings, with the overhanging upper storeys so prevalent in London and other parts of the country at that and previous dates.

A large house with two gables, No. 11 and 12, is a conspicuous feature in this thoroughfare of typical dwellings. It is a facsimile of that occupied by one of the French ambassadors, the Duke DE SULLY. This nobleman was the famous HENRI DE BÉTHUNE, Minister of HENRI QUATRE, King of France and Navarre. At the time he was accredited to our Court, and when living in this house, the walls were decorated with badges of his family, the French crown and the fleur-de-lys.

The next feature is a reproduction of a portion of Bishopsgate Street, being a low structure of wood and plaster taken from an old engraving. We would remind the committee that a house of ancient date still exists in Bishopsgate Street Without, of which a portion of the front and the upper storeys remain for the most part in their original state. This house was originally inhabited by Sir PAUL PINDAR, and to the writer's knowledge for the last half-century (and how long anterior he has not thought it necessary to inquire) has been used as a tavern, bearing the name of the worthy knight. The lower portion has been "modernised," but the first floor, with its overhanging storey, still retains panels of Tudor design. We think it would not have been amiss to have produced the original of this once-noted domicile.

We now arrive at an old house as it originally stood in Goswell Street. Stow says of this thoroughfare that it was a street "repleshished with small tenements, cottages and alleys, gardens, banqueting-houses, and bowling-places," and, standing as it did but a short distance from Aldersgate, was no doubt much frequented by some of the citizens for a little relaxation and pastime when a more lengthened walk was not desirable. This house is of the Elizabethan period, with mullioned and transomed windows. The adjoining house stood on the south side of London Wall, and the next is a half-timbered structure from Sweedon's Passage, Grub Street—the Milton Street, Cripplegate, of the present day. Two houses from King Street, Westminster, come next, and are good specimens of timbered dwellings, with carved bay boards. It is said that OLIVER CROMWELL resided in one of these in his earlier days, when present in London for his Parliamentary duties. The last on the left is a copy from one in Little Tower Street, apparently a very old structure, with a level instead of a gabled roof, and is decorated with medallions of certain Roman emperors. The old house with its galleried front is the Oxford Arms, Warwick Lane, where the old stage-coaches started for Oxford on Mondays, Wednesdays, and Fridays, according to an announcement in the *London Gazette* of 1672. Next follows a portion of old London Wall, which encompassed the City, and was about two miles in extent.

A specimen from Moorfields follows, which it will be remembered was situate just outside the City gates. The next feature is a block of houses that were standing up to the year 1800 at the corner of Hosier Lane, Smithfield, not far from Pye Corner, where the Great Fire of London in 1666 was arrested in its ravages. An old saying was once popular that the fire commenced at Pudding Lane (in Eastcheap) and ended at Pye Corner. In the days of Bartholomew (or Bartlemy) Fair, as it was commonly called, this neighbourhood was a place of great resort.

We are now transferred to the purlieu of Aldgate, and are introduced to the priory gate of the Church of Holy Trinity, which stood near the corner of the Minories, founded by MATILDA, queen of HENRY I., in 1108. It was pulled down and rebuilt in 1706, having become dangerous. History says that the precincts were given to Sir THOMAS AUDLEY, who became Lord Chancellor, by HENRY VIII., who died there in 1554. The estate was afterwards inherited by the Duke of NORFOLK, who married a daughter of Sir THOMAS's; and in the year 1662 the inhabitants of Duke's Place, as the precincts were then named (that of late years has reeked with the smell of oranges, for the sale of which it became famous), having a quarrel with the parishioners of the Church of St. Catherine Cree, secured leave from King CHARLES to rebuild the Priory Church. We are still accredited to the eastern part of the

City, or rather outside it, and our attention is next arrested by a *quainte hostellerie* called the Fountain Inn, situate in the Minories, and supposed to have been built about the year 1480. The Hall of the Brotherhood of the Holy Trinity forms the next feature in this typical collection, but the gable end only has been reproduced. This hall until 1780 stood in Trinity Court. It was first founded in the year 1377 by that unfortunate monarch RICHARD II., as a fraternity of St. Fabian and St. Sebastian. It was afterwards licensed by HENRY VI., and suppressed by EDWARD VI. Afterwards we reach a house the name of whose owner is something more than a household word with every man, woman, and child of English birth. Even now almost verging upon the "seventh" stage, we can recall the delight and wonder we experienced the first time the tale of DICK WHITTINGTON fell upon our astonished ears. Many will be the little prattlers that will be taken during the next few months to view this wood-and-plaster replica of the house in which the great and wonderful Sir RICHARD WHITTINGTON is said to have resided when he retired from active life, and carried out his benevolent undertakings. He is said to have held court in an almost regal manner, but for the benefit of the poor and afflicted alone. The house stood in Hart Street, Mark Lane, where still may be one or two dwellings of rather ancient date. And now we have almost reached the end of this historical thoroughfare. There are yet three houses to be seen, two of which were only recently removed from High Street, Borough, and another stood in Bankside, where at one time Swan Theatre was located, but they are not associated, so far as we know, with any historical reminiscences. We now emerge from this Medieval avenue, and again mingle in the surroundings of the nineteenth century. This show street has not been built for the benefit of the archæologist or the historian, but for the million, and to bring grist to the mill, and in this latter object no doubt it will be eminently productive. The committee have had the aid of Mr. BIRCH in preparing the designs for the buildings. The structures have been erected in the incredibly short space of six weeks by Mr. WILLIAMS, with Mr. W. G. SUTTON as clerk of works. The painting is by Messrs. CAMPBELL & SMITH.

In other parts of the exhibition various manufacturing processes will be carried on, and a large portion will be relegated to cookery, and a Chinese tea-garden, restaurant, and shop are amongst the novel attractions in this department. Three model kitchens are also fitted up, comprising a high-class one, suitable for a club-house or large mansion, which has been undertaken by Messrs. BENHAM & SONS, of Wigmore Street; and we know of no firm more capable of carrying out such an undertaking in an effective manner, the only difficulty they have had to contend with in giving full force to their wishes being the small space allotted them. The next, intended for a middle-class household, has been placed in the hands of Messrs. BROWN & GREEN, of Luton and Finsbury Pavement, who obtained the gold medal at the Smoke Abatement Exhibition, for their principle of under-feeding as applied to kitchen ranges and other grates. In this kitchen a flooring of a very durable and cheap mosaic, practically imperishable, that can be supplied at as low a price as the commonest tiles, has been laid down by Messrs. DIESPEKER & Co., of the Holborn Viaduct.

The dwelling itself will be illustrated in various ways. The "flat" system, until late years confined exclusively in our island to Scotland, is gradually feeling its way into the metropolis, and amongst an expensive class of dwellings; while our kinsmen north of the Tweed are building, year by year, more "self-contained houses," as they are pleased to call an independent house, and so the whirligig of time produces its changes. These arrangements are shown, and also models of other kinds of houses, from the mansion to the cottage. The sanitary and unsanitary features, now a popular theme, is duly set forth, and interior decoration, all professing to be hygienic in character, is displayed.

Although there are many foreign exhibits intermixed with our own, France and Belgium appear to be the only two nations whose Governments have responded to the call and have separate courts, if we except the Indian collection, which may be almost called a portion of our own. Probably the well-known deficiencies that exist in Continental nations as regards sanitary matters may have deterred them from entering the lists, but monetary considerations may also have had their weight in bringing about the result. In the French court a

large building, named "La Ville de Paris," illustrates by diagrams and models the Parisian sanitary arrangements.

Entering the eastern avenue, we may almost fancy we are in the midst of the Smoke Abatement Exhibition of 1881-82, for this portion of the building is again relegated to these appliances, and on all hands we recognise old faces and old exhibits, besides several that are new, but, like the rest of the exhibition, we must deal with these in detail at a future date.

A meritorious feature is the special department (although most here have that appellation) set apart for the workshop, in which is contained apparatus, fittings, and models of the various articles intended for the use of the workpeople who labour in unhealthy trades. If our artisans would generally adopt all the appliances that have been invented for their safety and the preservation of their health, there would be far less loss of life and chronic illnesses than now exist; but we know too well that the old proverb "familiarity breeds contempt" is as rife amongst our workers in dangerous and unhealthy trades as ever, and until a greater amount of common sense can be instilled into them, the efforts of philanthropists and humanitarians will lose half their effect.

There is one section of the exhibition to which the female portion of the community will flock in their thousands, and that is dress. Except from an artistic point of view we shall not, even in our future notices, attempt to dive into this, to us, almost sacred province of unknown quantities and mysterious adjuncts. Dress, from the time of the Conquest to the present day, embraces a wide range, but it is illustrated by means of figures, representing the "high born ladye," and (may we use the term?) plebeian, or peasant. These costumes have been designed by Mr. LEWIS WINGFIELD, and a collection of naval and military dresses from the Saxon age to the present period, on lay figures, is under the charge of General ERSKINE. It must be said that this department will disappoint archæologists. The "dummies" which are used are very ugly, and the dresses do not sit well. In many cases the materials are flimsy, and more satisfactory notion of ancient costume would be obtained from one of the large French or German books on the subject.

The electric lighting will also prove a great attraction, and will undoubtedly surpass the beautiful display of last year. Altogether there will be about 5,000 incandescent, and from 300 to 350 arc lights, and there will be, we believe, some novel features in connection with the lighting shown. The central object in the display will be the magnificent electrolier containing 99 lamps, manufactured by B. VERITY & SONS, King Street, Covent Garden, for the Electrical Exhibition at the Crystal Palace three years since, and that was the subject of so much comment on that occasion. This beautiful work of art is made of brass, the principal parts being all of hammered metal. The incandescent lamps are covered by coloured glasses representing the flowers of the blue-bell. It has been lent by the firm to the Edison Company, and is hung in the vestibule, but a short distance from the principal entrance, over which it will shed a flood of radiant light. More than 20 patentees and companies will, we understand, be represented with their different systems of lighting. On the present occasion we shall not attempt to give detailed descriptions of any of the exhibits, for although something like cleanliness and order existed at the opening, but few out of the great mass of exhibits are complete. But we must not close them without mentioning the magnificent pavilion and the corridors of Messrs. DOULTON, of Lambeth. These veritable works of art will be one of the most striking features in the exhibition. Everything composing these structures, including pillars, walls, steps, and floors, are of pottery-ware manufactured and painted at Lambeth. To attempt to describe these works at the present moment would be alike unjust to the firm and would be an incomplete record; but we have no hesitation in saying their like have never been seen before.

We must compliment the executive on their determination to exclude all those itinerant vendors that too often appear as plague spots and excrescences at most large exhibitions. Miscellaneous exhibits are certainly to be found, but they do not partake of the character of those we allude to. We have no feud with these people; they have to obtain their living as well as the most legitimate manufacturer, but we have always contended that they are not only out of place at such an exhibition as this, but are a nuisance to the legitimate exhibitor, and are certainly not required at South Kensington. There is yet another subject to which we desire to call attention, in

which the wisdom of the executive has been brought prominently forward. Medals of gold, silver, and bronze are announced to be given.

Everyone who has any knowledge of exhibitions is fully aware that the granting of awards often proves a thankless office to jurors, is productive of heart-burnings among exhibitors, and entails an amount of annoyance to the executive. He who can solve the problem to prevent this will prove a benefactor to all concerned. The committee are evidently fully alive to this, and have adopted a novel but ingenious plan that may rid them of a little of their responsibility. We in common with many others contend that jurors have often been selected on account of their scientific attainments. We are free to admit the value of science in such cases; at the same time we are equally certain that gentlemen of practical manufacturing knowledge should be imported into the council of jurors. Who are so capable of forming an opinion as to the make, quality, and action in use of various appliances as men whose business-life has been devoted to the study of such appliances? Such individuals must prove of great assistance to the scientific section, and should enable a better decision to be arrived at. At many International Exhibitions this idea has found favour, and we are pleased to find that an opportunity has been offered for its adoption here. Circulars have been sent to all exhibitors, asking them to name three gentlemen who, in their opinion, would be the most suitable men to judge of the value of their productions. No names are given as a nucleus to select from, but they are free to mention any one they please; but a committee has been formed to pass their opinions on such selections, and to endeavour to obtain a trio in each class in accordance with the wishes expressed. Now, if exhibitors send in suitable names, and such gentlemen agree to accept the office, a great load of responsibility is removed from the executive, and in fact exhibitors are offered the privilege of selecting their own jurors. If with this concession a competent list of judges is not secured, it is mainly the exhibitors' fault. They cannot blame the committee, and we shall have no sympathy with them if they complain of the awards.

### ILLUSTRATIONS.

AN OLD MANOR-HOUSE.

THIS illustration is a reproduction of a pen-and-ink drawing by Mr. JOHN LANGHAM, architect, Manchester, which is now in the Royal Academy. The style of drawing is characteristic of the author, and it is needless to say that the composition is imaginary. The illustration is nearly of the same size as the original.

HIGH ALTAR, ST. CATHERINE'S CHURCH, WEST DRAYTON

ST. CATHERINE'S Church was erected in 1869, from the designs of Mr. S. J. NICHOLL and Mr. T. J. WILLSON, then in partnership, but, owing to want of funds, very much had to be left incomplete, and it is only of late that the Rev. Mr. WREN has been enabled to proceed with the gradual completion of his work, the making of the designs being, by friendly arrangement, entrusted to Mr. S. J. NICHOLL. The baptistery and font, the Chapel of the Sacred Heart, and the Lady Chapel, all carefully designed in harmony with the style of the church, are finished, and the design now illustrated is for the high altar. The drawing is exhibited in the architectural room of the Royal Academy this year. The materials are stone, marble, and alabaster, with sculpture and paintings, enriched with gilding and colour and hangings of drapery.

HOUSE, BARKING ROAD, LONDON.

THE shape of the site of this house being triangular, and the building line 20 feet from the frontage, made it desirable to keep the building of as little depth as possible. The end of the drawing-room forms a large bay, terminating in a circular roof, and there is a small conservatory or fernery, with openings to drawing-room and hall. The staircase is triangular, with a polygonal landing towards the garden, the newel running from the top to the bottom of the house, and supporting flat domes under the landings. The materials proposed to be used are dark red bricks of the Woolpit Company for the walls, the roof covered with strawberry and brindled tiles made by the Madeley Wood Company. Inside, the ceilings will in nearly

all cases be of wood, with small ribs to form patterns; where plastered HITCHIN'S material will be used. The whole of the woodwork will be executed by Mr. C. WOOD, of the Crown Saw Mills, for whom the house will be erected, from the designs and under the superintendence of Mr. WILLIAM G. B. LEWIS, architect.

GLADSTONE BUILDINGS, SHEFFIELD.

THESE buildings are being erected by the "Gladstone Buildings Company, Limited" (formed by the local adherents of Liberalism), and will afford accommodation for the "Reform Club" and the "Liberal Association." The site is very eligible, situate in one of the principal thoroughfares, and overlooking the churchyard of St. Peter's. The buildings have been designed by and are being erected under the superintendence of Messrs. HEMSOLL & SMITH, architects, of Sheffield.

The Reform Club entrance is from St. James's Row, and leads into a spacious vestibule which is commanded by a porter's-room. The staircase and hall is divided from the vestibule by an arch and columns. On the right of the staircase are the lavatories, &c. The principal rooms on the first floor are reached by the staircase, and comprise a reception-room, 18 feet by 12 feet; dining-room, 43 feet 6 inches by 23 feet 6 inches; reading-room, 31 feet 6 inches by 21 feet (these two latter being capable of forming one large banquetting-room); writing-room, 17 feet 6 inches by 12 feet. The second floor embraces billiard-room, 43 feet 6 inches by 23 feet 6 inches; smoke-room, 31 feet 6 inches by 21 feet; library, 18 feet by 17 feet, and connected with both floors are the necessary serving-rooms, cloak-rooms, &c. The third floor is occupied by dressing-rooms, bath-room, and the administrative departments. Card-room, private dining-rooms, secretary's-room, &c., are provided on mezzanine floors.

The Liberal Association rooms, which occupy portions of the first and second floors, are entered from St. James's Street, and consist of a reading-room, 24 feet by 19 feet 6 inches, with writing-room attached; executive-room, 23 feet 6 inches by 19 feet 6 inches; meeting-room, 39 feet by 19 feet 6 inches, secretary's-room and waiting-room, lavatories, &c.

The ground floor (except where entrances as before named) is occupied by five shops or offices and by a restaurant, and the basement by a public billiard-room for six tables, with service bar and lavatory accommodation attached.

### THE SURVEYORS' INSTITUTION.

THE following candidates have passed the recent professional examinations:—

*Student Candidates for the Associateship.*—Harry Barratt, of Stourbridge; Robert Alan Benson, of the College of Agriculture, Downton; Walter de Hoghton Birch, of the College of Agriculture, Downton; Bernard Simon Dunning, of the College of Agriculture, Downton; John Henry Mead, of the College of Agriculture, Downton; William Timothy Hall, of Maidstone; John Baseley Selby, of Mornington Road, Regent's Park, N.W.; Edward Mixer, of Shepherd's Bush, W.; Thomas Willard, of Rugby. Of these candidates, William Timothy Hall receives the "Institution Prize" of 15*l.*, having obtained the highest number of marks (over 500) of any student candidate; and Robert Alan Benson and John Baseley Selby (bracketed equal), prizes of 10*l.* each, as second in order of merit among the student candidates.

*Non-Student Candidates for the Associateship.*—Thomas Arthur Dickson, of the Agricultural College, Cirencester; Edward Greenop, of Brixton Rise, S.W.; William Redford Halkyard, of Knutsford; Robert George Petre, of Chelmsford; George William Sadler, jun., of Cheltenham; Theodore Sturge, of Bristol; James Bruce Watson, of Tetsworth, Oxon; Jonas Marshall Webb, of Cambridge. Of these candidates, Jonas Marshall Webb receives a prize of 15*l.*, being first in order of merit of the non-student candidates.

The following candidates, who have previously passed the Associateship examination, have been successful in passing the Fellowship examination:—Charles Herbert Bedells, of John Street, Bedford Row; Henry Johnson, of Walbrook, E.C.; William Gustavus Stanhope Rolleston, of Leicester.

The following non-Associate candidates have also passed the Fellowship examination:—Alfred Mitchelmore, of Totnes, Devon; James Winder Peto, of Ixworth, Suffolk; William Smith, of Salford Priors, Evesham.

Making, together, 17 candidates who have passed the examination for the Associateship, and 6 candidates who have passed the examinations for the Fellowship, or a total of 23 successful candidates out of 36 who presented themselves for examination.

## THE CONFERENCE OF ARCHITECTS.

THE triennial Conference of Architects opened on Monday afternoon. Mr. Horace Jones received the members of the Institute at the rooms of the Institute. There was not a large attendance in the afternoon. On the walls of the west gallery some working drawings were hung, which gave opportunity to contrast the styles adopted by the late G. E. Street, R.A., the late W. Burges, and the late E. E. Viollet-le-Duc.

In the evening the fiftieth annual meeting was held, when the Report of the Council was presented and the officers were elected for the ensuing year. Mr. Barry, in moving the adoption of the Report, dwelt at some length upon the satisfactory state of the Society, socially and financially, as indicated by the steady maintenance of the number of professional members, now 1,100 in all, and by the cheerful character of the accounts, the ordinary annual expenditure being about 3,300*l.*, with a balance to spare. He also alluded to the advance of the principle of examination, and to the disposition manifested by the general body to insist upon reforms in the management, to which, although he himself held strong opinions, he loyally yielded, regarding the Council as the honoured servants of the Society, bound to carry out its wishes. Mr. Barry also regretted the absence from the Institute of the gold medallist of the year and several other very eminent architects, and went on to speak of the unreadiness of the Metropolitan Board to accept the advice of the Council under the provisions of the statute with reference to Northumberland Avenue; and lastly adverted to the labours of the Competitions Committee in the endeavour to establish the rule of professional adjudication as one means at least of improving an "abominable system." Mr. Fowler, of Louth, seconded the motion, and spoke of the want of interest excited amongst provincial architects. Mr. Cole Adams, being called upon, gave some information with regard to the work of the Competitions Committee, from which, however, he did not seem to expect very great results. Professor Kerr spoke in approval of the report, and said that after the observations of Mr. Barry, coupled with what had fallen from Mr. Cates recently, he hoped that no further necessity would arise for discussing a point of principle which involved a little unpleasantness. But at the same time he hoped the report would never again open with the statement that the Council presented it "for the information of the meeting;" it was presented for confirmation and approval. Mr. Kerr then called for a special recognition of the liberality of the President, Mr. Horace Jones, in his having taken upon himself the whole of the not inconsiderable expenses of last year's *conversazione* at South Kensington Museum. As regarded the Transactions, he complained of the small amount of business done, and remarked that, in the case of the Conference now opened, a little organisation seemed to provide almost as much intellectual work for one week as would serve the Institute for a whole year. When Mr. Barry complained of the absence of certain eminent men, and Mr. Fowler spoke of the apathy of the country architects, he considered that both of these shortcomings might be met. The elevation of the intellectual standard of the work of the Institute was the way to attract all men of eminence; and, as for the provincial practitioners, the way to secure their adhesion was to advance in liberality of management, in the direction of equality and fraternity, and he strongly recommended the adoption of some plan whereby, charter or no charter, every member of the body should have his vote received. After some remarks by Mr. Charles Fowler on the accounts, the report was adopted. The elections were then proceeded with, and Mr. Christian was elected president, the vice-presidents being Messrs. Brandon, l'Anson, and Waterhouse, and the ordinary members of Council the whole of the previous members, with the addition of Mr. Aitchison, A.R.A., Mr. Fawcett of Cambridge, and Mr. Cole A. Adams.

## TUESDAY, MAY 6.

It can hardly be said that the objects of the visits which were set down for Tuesday were well selected. In the three cases the works were in progress, and it was therefore impossible in the short space that was allotted to obtain a clear notion of what was to be accomplished. The explanations that were offered could only be heard by a few. If a little foresight had been exercised, and if printed descriptions had been handed to the visitors, or if the architects had obtained the assistance of some of their friends to act as guides, a good deal of information might have been obtained. But, as usual, everything was left to chance, and there was in consequence the usual amount of grumbling among the country visitors who had been induced for the first time to attend a conference.

The Guildhall Council Chamber is a twelve-sided Perpendicular hall, and, when completed, will be likely to answer for meetings. Whether it is ever to be occupied as a Council Chamber is uncertain. The windows are filled with stained glass, the roof will be coloured and gilded, and all that money could obtain will be found around. The workmanship is creditable to the contractors, and the design is rigidly correct in the details. But it was impossible to give any notion how far a speaker's voice will be heard

in the hall, or on how many days it will be necessary to employ gas or the electric light. The galleries are reached by winding stairs, and the channels which are cut in the newels will be great temptations to young folks, if any are admitted. Afterwards the visitors were led to the Corporation Library and Museum, two places which are open to the public throughout the year.

The new building of the Stock Exchange was next visited. It is farther from completion than the Council Chamber. The principal feature will be the great hall, which eventually will have an area of 16,000 square feet. The walls are covered with marble slabs, but the spaces are so large that the use of the material appears to be mere ostentation of wealth. If a less lavish use had been made of the marble its value would be enhanced, and the appearance of the wall surface would be less monotonous. The hall will be covered with a domed roof. It will rest on a ring, formed of a wrought-iron rivetted girder about 2 feet 6 inches deep, which is carried all round the hall. The ribs will be of cast iron, and the dome will be covered with copper, for it appears that the members of the Stock Exchange have an aversion to sunlight. The roof has been designed and constructed by Mr. Dawney, C.E., and, judging from tracings which were exhibited, it will be an excellent example of engineering. The upper part of the hall is in hard Portland and Daubigny stone. The carving of the Italian ornamentation is now being done, mainly by foreign workmen, and is bold and good in style. The contractor for the works is Mr. George Shaw, and Mr. J. J. Coles is the architect.

In the afternoon the works of the District Railway Extension were visited, and the journey under Cannon Street was attended with more or less discomfort. Here again the time was insufficient, but probably it did not matter so much, as similar works are never likely to be conducted by architects. The great difficulty in constructing the railway was to avoid expensive interference with the superstructure of the houses along the route, and it is well known that in order to be prepared for contingent litigation, photographs on a large scale were taken of the buildings in Cannon Street, so as to enable the Company to give evidence with regard to settlement. The construction of the line under the court of the Cannon Street Station, and under the statue of King William IV. is the part of which the engineers and contractors appear to be most proud.

The second meeting was held in the evening in Conduit Street, Mr. Charles Barry presiding, when the following paper was read and discussed:—

## Architects, Clients, and Contractors.

By ARTHUR CATES, F.R.I.B.A.

When drawing up the programme of the proceedings of this Conference, the committee considered that "the duties, obligations, and mutual relations of architect, client, and contractor with reference to both English and foreign practice," would form an excellent subject for discussion at one of the meetings. They accordingly prepared a series of questions which were addressed to correspondents of the Institute, with the result that replies have been received from Professor Fenger, of Copenhagen, Th. Ritter von Hansen, of Vienna, and Herr Ende, of Berlin.

Communications respecting the practice in America have also been received from Mr. Sydney Smirke, who practised for many years in America, and who will, I hope, be present here this evening, and favour the meeting with his observations on those points in which American practice differs from ours.

At the request of the committee I have read these communications, and summarised them in such a manner as will, I hope, satisfactorily open the discussion.

For France I am indebted for much information to Mr. W. H. White and Mr. R. Phené Spiers, and have referred to some of the leading text-books on French building legislation, more particularly to "Manuel des Lois du Bâtiment," published by the Société Centrale des Architectes; Frémy Ligneville, "Traité de la Législation des Bâtiments," 2 vols., 8vo., 1881; O. Masselin, "Nouvelle Jurisprudence et Traité pratique sur les Honoraires des Architectes," 8vo., Paris, 1879; O. Masselin, "Nouvelle Jurisprudence et Traité sur la Responsabilité des Architectes, &c.," 8vo., 1879.

I must admit that when the questions settled by the committee were first placed in my hands, I was somewhat startled by the wide range they covered, which seemed to me likely to require a whole conference, or even a series of conferences for their complete discussion. As, however, the time at our disposal this evening is but limited, and the object of the meeting is to afford those who attend an opportunity of expressing their views and discussing points of general practice, I will, as shortly as possible, bring before you the replies which have been received.

Happily, the first question, which relates to the tenure of land for building purposes, has been thought to be of sufficient importance to have an entire meeting appropriated to its consideration, and to-morrow (Wednesday) morning Mr. Blashill will read a paper thereon.

## Position of Architects on the Continent.

The next series of questions relates to the architect, and it will be convenient to consider each separately. Thus:—

When an architect is employed upon the erection of a house, is it usual for him to perform the following services?—(a) Preparing

all the drawings that are required, and a specification of the works ; (b) Arranging terms with the contractor or contractors ; (c) Superintending the work ; (d) Deciding on the amount of money that is to be paid to the contractor or contractors according to the terms and dates of payment.

To this the reply from Copenhagen is the simple affirmative, Yes ; but in Austria the architect's duties appear to be somewhat more extended, as beyond those set out in the question he prepares an accurate estimate of quantities of the building to be executed, from which the contractors can ascertain the quantities of the several descriptions of work.

A similar practice appears to exist in Germany, and in France the preparation of the *Devis estimatif* is one of the duties of the architect, and is included in the services covered by his commission ; but on this head more particulars will be given when the tariff of charges under which German architects work and the remuneration of French architects is considered.

To the third question—Does the architect usually perform any other services?—the reply is in each case, No.

4. Is his decision as to the quality of the work and material, and as to payments, final and binding?—is answered, in accordance with ordinary English practice, with the proviso, as regards Austria, that if the contractor desires in such cases to appeal to a legal tribunal, the right of doing so must be expressly stipulated in the contract ; while in Germany it is often stipulated in the contract that in cases of dispute one or more arbitrators shall decide the question at issue.

5. Is the architect responsible to the client for any losses that may arise through bad work or materials which he ought to have checked ; and if so, for a limited or unlimited time ?

It appears that in Denmark this responsibility has not hitherto been exactly defined by law or by custom, but if losses have been suffered through the architect's neglect or liability, the employer may sue him for damages within the first twenty years. The reply from Vienna is vague, and to the effect that the contractor is held responsible for, and to make good, loss through bad work or bad material. The Architectural Association of Germany has the responsibility of the architect to the client at present under consideration, but no decision has been arrived at. There the tradesman is responsible to the architect as well as to the client for the goodness of the work. In doubtful cases the architect leaves the selection of the tradesman to the client, thus giving the latter an influence by which he cleverly diminishes his own responsibility. No instance is known to Herr Ende in which an architect has had to bear the responsibility for the shortcomings of a tradesman. Every architect is legally answerable for his designs so long as these are followed. Where a tradesman deviates from the instructions of the architect, the latter assumes the responsibility if he sanctions deviations in a general way. If the architect is demonstrably lax in his supervision, of course the law holds him responsible.

In France and those countries subject to the Code Napoléon the responsibility of architects and contractors is defined by six articles of the Code Civil, four of which are of general application, while Art. 1,792—"Si l'édifice construit à prix fait, péricule en tout ou en partie par le vice de la construction, même par le vice du sol, l'architecte et l'entrepreneur en sont responsables pendant dix ans"—appears to make the architect and contractor liable for ten years ; and Art. 2,270—"Après dix ans, l'architecte et les entrepreneurs sont déchargés de la garantie des gros ouvrages qu'ils ont faits ou dirigés"—relieves the architect and contractor from liability after ten years.

#### *Responsibility of Foreign Architects.*

There has been considerable controversy as to the exact meaning of Art. 1,792, it being contended that it is only applicable where the architect is the contractor ; but, nevertheless, the responsibility attaches to the architect under the general principles of Art. 1,382 :—"Tout fait quelconque de l'homme, qui cause à autrui un dommage, oblige celui par la faute duquel il est arrivé à réparer" ; Art. 1,383 :—"Chacun est responsable du dommage qu'il a causé, non seulement par son fait, mais encore par sa négligence ou par son imprudence" ; and Art. 1,992 :—"Le mandataire répond non seulement du dol, mais encore des fautes qu'il commet dans sa gestion," which make him, in common with all other citizens, liable for the results of faults he may commit, and those he may by negligence or otherwise permit others to commit over whom he may have authority. For errors of design and want of skill resulting in failure of the building wholly or in part, neglect of legislative enactments and municipal and police regulations, neglect of servitudes and easements to which the site is subject and which the architect could have ascertained, providing a building which does not satisfy the defined requirements, the client has his remedy against the architect alone. For improper execution of work, defective or improper material or workmanship, the client's remedy is against both contractor and architect—against the one for having committed the wrong, and against the other for having by inefficient superintendence permitted it ; but the architect himself has his remedy against the contractor. These responsibilities have many qualifications arising from the varying

relations of the parties, but it would not be possible to enter into such details on this occasion.

The limit of ten years does not apply to cases of fraud : in these the term of prescription is extended to thirty years. In England the Statute of Limitations being seven years, it would appear that the architect is in ordinary circumstances protected after the lapse of that period.

#### *Scale of Foreign Fees and Measure of Professional Work.*

6. On what basis is the architect's remuneration calculated, and is this settled by any law or custom ?

The Danish architects have not yet agreed upon a schedule of remuneration, but often use the German and Swedish schedules, which will be found in the report of the Congrès International des Architectes, Paris, 1878. In Austria the terms of professional remuneration are not fixed by law, but the Architectural Association has drawn up a certain scale of charges. It is, however, optional with the architect and client whether they accept this or not. As a rule professional remuneration is calculated at from three to five per cent., according to the nature of the work. In Germany a very elaborate tariff is adopted which was drawn up by the Architectural Section at the Fifteenth Congress of German Architects and Engineers, held at Hamburg in 1868. The ordinary work of the architect is there divided in five classes, commencing with ordinary agricultural buildings and the plainest description of town and country dwellings, and ending with exterior and interior decorations and ornamental work. The scale of remuneration is set out under six subdivisions of the architect's work and nine progressive stages of cost, the first limit being 300*l.* and the highest 30,000*l.* and upwards.

The services to be performed by the architect are defined as :—

- (a) *Sketches*.—Preparing sketches (plans and elevations) drawn to scale, and (if desired) an approximate summary estimate of cost.
- (b) *Design*.—Preparing complete design, with plans, elevations, and sections, together with a summary estimate of cost as for (a).
- (c) *Working Drawings and Details*.—Preparing the requisite working drawings and the detail drawings of construction and decoration.
- (d) *Estimate of Cost*.—Preparing a special estimate of cost of construction.
- (e) *Execution*.—Drawing up contracts for, and letting and general superintendence of, the execution of the whole of the works, exclusive of special superintendence.
- (f) *Accounts, &c.*—Checking and certifying the accounts, exclusive of measuring up.

For works of smallest cost the rate per cent. for the entire services varies from 5 per cent. on the smallest expenditure for the lowest class of building to 9½ per cent. for a like expenditure on the highest class of building ; while for works of greatest cost the rate of remuneration varies from 2 per cent. on the largest expenditure for simple buildings to 5 per cent. on those of the highest class. Fees on rebuilding or additions to existing buildings where a special design is necessary are calculated at one-fourth more, and where a design is not necessary at one-fourth less than for the same class of new work. Advances on account during the work, in proportion to the progress of the work and in accordance with the rules, shall always be paid to the architect on demand. If the estimate be exceeded such excess shall not increase the fee, but the cost of duly sanctioned extensions or more sumptuous treatment of the work shall increase it. All drawings remain the property of the architect. The client may demand copies of the design, but shall use them only for the work to which they relate. This German tariff has been adopted by the architects of Belgium, Switzerland, and Italy, and has, I think, been printed at length in the London professional journals. The remuneration of architects in Sweden is regulated by a system similar to that adopted in Germany ; but, while the services to be rendered are similar to those there given, the rates of percentage are somewhat less.

The services to be rendered by an architect in Sweden, are :—*Esquisse*,—*Dessin net*, avec un devis approximatif. *Dessins et plans principaux*,—*Dessins complets*. *Devis et descriptions*,—*Calcul des frais*, avec indication des quantités et des prix, ainsi que désignation des matériaux, et du mode du travail. *Epures*,—*Tous les dessins de construction et d'ornementation*. *Surveillance*,—*Stipulation de contrats d'entreprise et surveillance de l'exécution*.

In France it has been decided by the Cour de Cassation as recently as 1875 that no law or regulation exists which fixes the fees due to an architect for private work ; that the Courts should, in the absence of any agreement, regulate them with reference to the work carried out and the services rendered. Public departments, such as the Ministère de l'Intérieur, des Travaux Publics, des Cultes, La Ville de Paris, &c., make special contracts, by which the architect, besides an annual salary ("*traitement fixe annuel*") is entitled to a commission ("*traitement proportionnel*") on the cost of the work ; and after their completion, he might be granted a further payment ("*gratification*"), not so much as a pecuniary advantage, but as an expression of satisfaction for work executed with economy and skill. Although the fees of architects have never been fixed by law, because the art is a liberal one, they are, when not otherwise agreed, generally determined by the custom of the place, or the scale fixed by the Conseil des Bâtiments Civils in 1800, and confirmed in 1841, by which the remuneration of archi-

fects employed by the Department was fixed at 5 per cent., the services to be rendered being defined thus :—"Confection des plans et des projets, la conduite des ouvrages, la vérification et le règlement des mémoires."

#### *The Five per Cent. Rate in France.*

The whole question of "honoraires" was very fully discussed at the Congrès International des Architectes, held in Paris in 1878, and under the auspices of the Société Centrale des Architectes, and I would refer those who are desirous of more detailed information than can be here given, to the report of the proceedings of that Congress published in 1881 by the Ministère de l'Agriculture et du Commerce.

The subject has occupied the attention of the Société Centrale des Architectes not less than that of this Institute. In 1849 a committee of that body reported that 5 per cent. must be taken as a mean applicable to most cases; had been generally recognised by courts of justice, but by arrangement, by reason of the importance or otherwise of the services rendered, might be deviated from.

The following extracts from some of the communications made to it sufficiently explain the spirit with which the question was considered at this Congress :—

"Whatever the merit of the architect who conceives and executes, whatever the nature of the work, whatever the skill, care, and time devoted to the studies and to the superintendence—always 5 per cent.

"The painter, the sculptor, obtain for their works their value; the physician, the counsel, charge their fees in accordance with their position and merits, and the care which they bestow.

"The counsel may have mistaken the case, and advised his client badly, but the latter pays the fees, and no more is said.

"The physician may have erred, his patient dies, and with him the doctor's mistake is buried; but nevertheless his fees are paid.

"The architect, however, receives always 5 per cent.; but if he makes a mistake, or is deceived, or if he has given way to concessions which may compromise his work, the critic is ready to seize with avidity on his faults, while justice is invoked against him with such rigour that even his future prospects may be affected, and that fortune and position, to attain which the architect is ever struggling, may be compromised.

"Pretended architects accept work on such terms that they cannot without loss perform the serious duties of the profession; but certainly if they thus lose, they profit in other and less legitimate ways.

"The client who thinks he has made a good bargain is not aware that the architect obtains from the contractors more than the difference he has saved, and to obtain it sacrifices his liberty of action, and hands himself over to them."

M. Davioud strongly urged the impossibility of framing an equitable tariff, the inapplicability of such a tariff system to an open and liberal profession, and the necessity of leaving each practitioner to assess his own value and to make his own bargain in accordance therewith and the nature of the work to be undertaken. In the result, after very long discussion, the Congress arrived at resolutions to the following effect :—The Congress, acknowledging the principle of freedom of labour and its unfettered remuneration, which is established on the principle of supply and demand, is of opinion that every architect should appraise his work at such value as he may think fit, which should be a fair remuneration for the skill displayed and the special difficulties overcome. Nevertheless, in the absence of any special agreement, it considers that the Avis du Conseil des Bâtiments Civils should be applied as a minimum until such scale has been modified in an equitable manner.

#### *Five per Cent. not a fixed Standard in England.*

Thus, the result of the Congress was that the inevitable 5 per cent. was considered to be a reasonable basis of remuneration. Here, in this room, the architects of the United Kingdom have, at great length, and for the last time twelve years ago, discussed the same subject and arrived at a similar conclusion; but having printed a document setting forth the opinions of this Institute and that Conference with reference to professional charges, it has been most unjustly imputed to the Institute that it partakes of the character of a trade union, an impression being somewhat general that adherence to the terms set forth in that document is an essential condition for membership of the Institute.

My own view of the position is this—that the document expresses the ordinary custom of the profession, by which, in the absence of any agreement to the contrary, the relations between architect and client should be governed; but the architect is left perfectly free to himself assess the value of his work. If the circumstances of the case and the nature of the work permit him honourably to accept a lower rate of remuneration he is perfectly at liberty to do so; while, on the other hand, if he considers that his position in the profession or the value or importance of the services rendered entitle him to make his charge at a higher rate, or as has been done by a late well-known and highly-respected

member of this Institute, without regard to percentage at all, he is perfectly at liberty to do so, and to secure the highest remuneration he can obtain.

#### *Foreign Practice as to Ownership of Drawings.*

The seventh question, "Are there any other important matters affecting the architect in his relations to his client or the contractor?" has not elicited any replies which need occupy your attention, but the ownership of the drawings is one which certainly merits the most careful consideration of the Conference, and may be considered under this head.

In France, Frémy Ligneville (vol. i. p. 229) declares the law to be that in the absence of any agreement to the contrary, the fees paid to the architect are considered to be due, not only for the construction of the building, but also for the preparation of the plans in accordance with which it has been erected. Thus the client can demand the delivery to him of these drawings, and the architect cannot claim any special fee for them; but the architect has the right to retain the plans and specifications he has prepared until his fees have been completely paid. The sixteenth article of the Institute document expresses the general custom that the drawings and specification remain the property of the architect, but recommends a distinct understanding with the client on this point. The German architects, in the remarks appended to the tariff before referred to, dispose of the question thus :—"All drawings remain the property of the architect. The client may demand copies of the design, but shall use them only for the work to which they relate." The third general head under which the questions were framed was that of "The Contractor," and in considering the replies and statements which I shall have to put before you, it must be borne in mind that the circumstances under which buildings are executed are so variable, and dependent upon so many conditions, that the information given must be accepted as only of general application, and not as representing invariable practice.

#### *Sub-Contractors on the Continent.*

The eighth question runs thus :—"Is it the custom to employ a general contractor to execute all the works required to be done in a building, or is the contractor employed for each trade, viz., a contractor for masonry, another for carpentry, another for iron-work," &c.

In Denmark both arrangements are usual. In Austria, in better class buildings, as a rule, separate tradesmen and contractors are usual for the several descriptions of work, as the master-mason or master-bricklayer, the stone-cutter, the master-carpenter, constructor of ironwork, plumber, &c. In Germany both modes of letting work are practised. Where the client engages an architect, he, as a rule, requires that the work of each trade be let separately. A great many architects, however, undertake the erection of buildings for a lump sum, especially in cases where the client wishes to be insured against extras, desires not to have to deal with so many parties, and prefers the sole and exclusive responsibility of the architect to that of a multitude of individuals. In England it occasionally occurs that the builder provides the design and drawings for the work he carries out; in fact, it is rumoured that builders who so proceed have said, "Oh, we keep an architect, and you need not go to the expense of employing one;" but the architect who contracts to carry out his own design is in these days, I think, quite unknown. If the practice does exist it would be most desirable that, if possible, full information should be given to the meeting respecting it. In France the general practice is to employ separate tradesmen, an independent bargain being made with each; but the general contractor is not entirely unknown. The ordinary practice appears to be that what was, I think, formerly universal in England, and is still retained in the North. Mr. R. P. Spiers has communicated to me a letter from M. Pascal, a distinguished Parisian architect, in which he says on this subject :—

"Notwithstanding the advantage which may be derived from having one general contractor, we prefer special tradesmen, who do their work better. The sole difficulty for the architect is to make them work in harmony with each other without reciprocally causing delays or prejudice to other works.

"The general contractor naturally takes a profit from each sub-contractor, hence augmentation of cost. He cannot be competent in all the specialties which he represents. Hence inferiority in the quality of the work: two causes which lead to the system of division of the trades being preferred even to the extent that a general contractor is only occasionally admitted for the works of the State."

There is a growing tendency in England towards employing special tradesmen for important sections of the work, but the great saving of trouble and annoyance arising from the employment of the general contractor renders it hardly likely that the good old system of master tradesmen contracting for each trade will be revived, and handicraft thus suffers.

#### *Foreign Tenders.*

9. "Is it usual for a tradesman or tradesmen to contract to do the building as shown by the drawings and specification for a fixed sum to be paid to him or them by the employer?"

The reply to this question received from Berlin is so important, that I should have been glad to have had the opportunity of making further inquiry respecting it, but time has not permitted this, and I will therefore quote the words of Herr Ende:—

“Cases in which the erection of a building according to the designs and estimates of an architect is let to a contractor who is not an architect are comparatively rare, particularly as regards elaborate and ornamental buildings, though it is done in the case of simple and ordinary ones, the reason being that, according to the idea prevailing here, an artistic building can never be completely finished from the first design and the first estimate, but the chief and best portion of the work must be designed and worked out during its construction. There is, however, an end to this when a contractor undertakes the building. Alterations can then be made only under stringent and costly conditions, which give occasion to all kinds of disputes.”

The ordinary French system appears to be *Marché au Rabais* or *Par série de prix*. Till recently *La Série de Prix de la Ville de Paris* was generally accepted as the basis, and each separate tradesman made his offer at a price to be calculated at a percentage above or below such schedule of prices. Recently the Société Centrales des Architectes has issued a *Série de Prix*, and the authorities of the departments and the great cities have also engaged themselves on the preparation of similar schedules suitable to each locality. The *Marché à Prix fait*, or *à Forfait*, is a contract for a lump sum, very similar to our ordinary contracts.

There is also another form of contract which removes the inconvenience attending that *par série de prix* of the client not knowing beforehand what the ultimate cost will be. This is known as the *Marché de Maximum*, and combines both the preceding systems, the bargain being that the work is to be paid for in accordance with the *série de prix*, but with the reservation that the total cost shall not exceed a fixed sum.

#### *Selection of Contractors Abroad.*

10. The Committee then ask, “Is it usual to select a contractor by means of tender received from several tradesmen stating the price at which they will do the work?”

In Austria the best method of selecting a contractor is thought to be by competition, either a limited one among trustworthy firms, in which case the contract must be given to the lowest tenderer, or an open one, in which case the contract is not necessarily given to the lowest tenderer, but to the most reliable one at the lowest possible prices.

#### *Foreign System of Measuring.*

11, 12, and 13. “Does a contractor make up his tender by means of measurements or quantities taken from the drawings and specification? Are these measurements prepared by the contractor or contractors for his or their own use, or by some other person for his use? Who pays that person?”

I feel much hesitation in dealing with these questions, as they can only be satisfactorily answered as the result of closer inquiry than it has been possible to make. In Denmark the contractor makes his measurements for his own use. They have no surveyors to take out quantities, and nothing is paid for them. In Austria the amount due to the contractor is ascertained by measurement from the drawings of the work actually performed, and it is only as an exception that the measurements are taken from the work itself. The measurement and taking out of quantities are performed by the architect from the plans, but the contractor has to make out a measurement for the account. In Germany estimates of quantities are prepared by the architect, or at least under his instructions by his permanently-employed assistants. There are some few persons who occupy themselves exclusively in the preparation of estimates; but the architect has in all cases to check their work and be responsible for it. The system of *verificateurs* which obtains in Paris is quite unknown. In France the architect should provide besides the *devis descriptif*, or specification, the *devis estimatif*, or particulars of quantities, which documents, together with the general conditions, constitute the *cahier des charges*. When a contractor tenders he employs a *mètreur* to take out quantities. This *mètreur* is often a clerk in the contractor's office, and is paid by him. The *mémoires* and bills are checked by the architect or the *verificateur* paid by him. In Germany the architect is responsible for the estimate of quantities, but he endeavours to diminish his responsibility by submitting the calculations to the contractor for the purpose of being checked and conforming to his criticisms; that is, adopting the same reckoning. The responsibility of the contractor to the employer for losses caused by bad work and materials is in France and in Germany limited, unless otherwise stipulated, to a period of ten years, and I commend to the student of this subject the treatise of M. Masselin to which I have before referred.

Generally each of the correspondents appears satisfied that the system in use in his own country works fairly well, Professor Fenger making the necessary reservations:—1. That only competent persons are employed as architects and contractors. 2. That the necessary time is granted for preparing plans, specifications, and tenders, and for erecting the building. Generally

reviewing the information which has been collected, it appears that the profession in England occupies a position in many respects more advantageous than in other countries, and, although the discussion will, I hope, advance towards a solution of some of the doubtful questions still capable of being mooted, there is, I think, but little which could with advantage be adopted from foreign practice into our own.

#### *Disputes in Contracts.*

There are two subjects of some interest which were not touched upon in the questions prepared by the Committee, or alluded to by their correspondents, with regard to which I beg leave to occupy your attention for a few minutes. These are known in France as *Expertise* and *Privilege*.

*Expertise* relates to the course taken in litigation to inform the court upon technical facts, the endeavour to ascertain which is under our law generally made by the oral evidence of witnesses, who, from the very character of their retainer on behalf of plaintiff or defendant, often fail to dissociate from themselves the imputation of advocacy, and the nature of whose testimony has given rise to an observation attributed to a late eminent judge, that “professional witnesses not unfrequently become witnesses by profession.” It is clear that in litigation in which technical matters are involved the court must obtain information from persons acquainted with the art or trade in question. The court has to apply the law on the basis of facts of which it can only have cognisance when they are proved before it either orally or in writing.

The experts are generally three in number, are appointed by the court, and report to it. The parties may object to the nomination of an expert on certain defined grounds, such as relationship or connection with one of the parties; having been in any way concerned in the proceedings; having expressed an opinion on the matter in dispute; or being known to be hostile to one of the parties. They are sworn to honestly fulfil their duties, and, when once sworn in, it is compulsory on them to proceed and make the report. They are not arbitrators, who are really judges and decide the case; they merely ascertain the facts and report their professional opinions. They hold an inquiry on the spot, the parties being summoned to attend, and having the right to be present and to assist at the inquiry; in fact, at all that forms a material part of the *expertise*, except the preparation of the report, which is, of course, carried out by the experts in private.

The report consists of two parts:—*a.* The *procès verbal*—statement of proceedings, and of the facts as ascertained. *b.* The *avis*—the opinion or recommendation at which the experts have arrived as the result of their consideration of the facts.

When the three differ in opinion, and are not of accord in making one report, such opinions and the grounds of difference must be stated without indicating which is the personal opinion of each. The court is not bound to follow the recommendation of the experts, but consults it for information, and makes such use of it as it thinks fit. It is, therefore, desirable that the reasons for the recommendation should be given, but that the mind of the court should not be prejudiced, as it might be by the names of the experts being attached to each opinion. Occasionally in English practice, in the Common Law divisions, and more frequently in the Chancery Division, the courts have desired to be informed of facts by independent experts instructed by the court; but, so far as I am able to form an opinion from cases I have read, the French system I have slightly sketched appears better adapted to ascertain the truth and correctly inform the mind of the court, than our system of “teams” of witnesses, who are often cross-examined by counsel whose deficiency of technical knowledge places them at a disadvantage, while the contradictory testimony of the witnesses confuses the court, and obstructs the administration of justice.

#### *Payment of Foreign Architects and Contractors.*

The *privilege* of architects and contractors over the works of construction they have carried out to secure them payment for their work, gives them the right of being paid out of the proceeds of the sale of the property in preference to the creditors of the owner, even as mortgagees. A similar privilege was accorded in Roman cities by Marcus Aurelius, but applied only to the rebuilding of destroyed premises, in order to give architects and builders an encouragement which would facilitate the embellishment of the cities by the prompt restoration of ruinous buildings. “Ne urbs ruinis deformaretur.” But, tempting as the prospect of thus securing payment may be, stringent formalities must be complied with before the *privilege* can be obtained.

Thus, before the commencement of the work, an expert named by the Tribunal of First Instance of the district in which the works are situated prepares a *procès verbal*, describing the condition of the property at the time, the object being (1) to preserve the value of the property as it exists before the works, for the benefit of the creditors who may already have a charge upon it; (2) to afford a basis for ascertaining after the completion of the works the augmentation of value of the property resulting from such works, and it is only over this augmentation that the *privilege* can be exercised.

Within six months from the completion of the works they must have been accepted by an expert similarly appointed. He may be the same as acted at the commencement, but must be newly appointed. He prepares a *procès verbal* descriptive of the works and of their cost. These two documents must be registered at the Bureau des Hypothèques of the district, and it is only then that the *privilege* can be obtained.

Frequently, to avoid these formalities, architects and contractors are content with a charge on the property, either by the terms of the contract or by a separate deed; but this security is far inferior to that obtained in the more formal manner.

There are other subjects upon which I might enter, but I must bear in mind that I am not professing to read an exhaustive paper, but am simply bringing before you such notes as may serve to introduce a discussion on topics of interest to the profession, and that the most valuable portion of this evening will be that which affords the members of the Conference the opportunity of expressing their opinions and raising discussion upon some of the important professional questions to which I have alluded.

Permit me, in conclusion, to say that the cordial thanks of this Conference are due, and will, I hope, be warmly accorded, to those corresponding members of the Institute who have so kindly and so carefully answered the inquiries addressed to them by the Committee.

#### Discussion.

THE CHAIRMAN, in inviting a discussion of the paper, said that it was evident that they owed a great debt of gratitude to Mr. Cates for the great labour and research that that gentleman, busy man as he was, must have given to the subject, and had thus been enabled to put before them a mass of dry statistics in such form as would enable them to draw their conclusions from them. In the various data brought from the different countries abroad each correspondent had notified that architects were as a rule perfectly satisfied that the system under which they work was the very best one. He should not wonder if they themselves came to the same conclusion with regard to their own system, and that they had little to learn, though much to interest them in these details of foreign practice.

Mr. CATES, in replying to a question, said that as far as he understood the communications he had received, it appeared that the payment for the preparation of estimates was covered by the commission. The architect certainly had to pay the *verificateur*. There was no special remuneration received by the architect for taking out quantities. In Germany it was generally understood the architect should not receive anything whatever from the contractor.

Mr. TAVERNOR PERRY referred to a large work he was engaged on in Germany jointly with another architect, Herr Lang, of Berlin. They shared between them 6½ per cent., doing all the drawings, quantities, &c.

Monsieur LEUCHARS addressed the meeting, confining his remarks chiefly to points concerning the remuneration and responsibility of French architects.

Mr. E. C. ROBINS, F.S.A., alluded to a difficulty in the question of ownership of plans—viz., that the architect's drawings, when they passed out of his hands and ceased to be his own property, were liable to be used improperly. In his own experience no use had been made of them except in case of something going wrong with the drainage, &c., when they merely wanted the guidance of the plans to enable them to remedy what was wrong. His practice was always to furnish his client with drawings showing the drainage, &c., and he had never been asked for more. He would ask whether in the provinces clients asked for plans, and if so, what plans were asked for, and if they suffered any invasion of their rights in giving up their plans?

Mr. BRUTON, Oxford, said that some years ago he designed a building for a limited liability company, who demanded afterwards to have the drawings, to which he had answered that he considered the drawings were his property. To this they replied that if he declined to give up the drawings he must furnish them with the name of his solicitor. Consequently he had submitted, and sent them the drawings.

Mr. J. B. FRASER, of Leeds, said that in the course of his long practice he had never been asked for anything beyond the drawings which showed the drainage arrangements. He had a word to say also on another point, viz., the taking out of quantities. In the provinces their experience, as a rule, was entirely in the direction of the quantities being taken out in the architect's office. Moreover, the employment of a surveyor would probably be the cause of considerable mischief. A charge was, Mr. Fraser said, always made for the quantities, and with regard to responsibility for them, the work was measured on completion.

The CHAIRMAN: Thus the architect takes the responsibility.

Mr. FRASER: To a certain extent it is so. If a mistake occurs, and a deficiency results, he knows well how to make it up.

Mr. L. C. RIDDETT said that in his experience, when the London School Board employed outside architects, it required them to deposit the original drawings with the Board. An old friend of his made a set of tracings, gave them to the Board, and retained his drawings, and he heard no more of the matter. As to quantities, they in London could not be familiar with country practice, but they got some sort of insight into the sort of quanti-

ties which came from masters of all trades, and they did not find they got from these gentlemen good architecture or good quantities. If they could imagine an architect sitting down seven hours a day to take out his quantities, they might also believe in his doing his work, the work of an architect, with the skill attributed to such architects as Sir Gilbert Scott, &c. For his own part he had firmly resolved never to act as judge in any case, and never to act as surveyor in his own case. The two functions were utterly incompatible. The practice also encouraged a bad tendency of the day, conducive more and more towards hurry and slovenliness. Would builders accept the architects' quantities as accurate? The London builders looked principally at the name which was on the bill of quantities, and were inclined to look on an architect as a man who had to serve two masters. Architects in the provinces laboured under great difficulties. They could not send their drawings to a London surveyor. The employment of a country surveyor would mean mischief in the way of gossip. Everything, however, seemed to point to this, that quantities, when taken out by the architect, should become part of the contract. A body of men—measurers, as they had in Scotland—were needed in England, with the power of an appeal, both on the part of the builder and the client. This left the architect his 5 per cent. without responsibility for the quantities, and the builder understanding he could appeal from the architect, justice would be done, and matters go right.

Mr. JOHN HONEYMAN said he considered they had in the North the best system altogether. Having a competent architect, a competent surveyor, and time to do the work, nothing could be better. It never happened that an architect in Glasgow took out his own quantities, as they had excellent measurers to do that work. But it did not follow that they did not understand quantity taking. It would be utterly absurd if they did not, for again and again they had to check the measurers in mistakes which would be detrimental to their clients. Thus their quantities were taken out by men who were used to the work. The architect undertook to give the measurer all information required, plans, details, &c., so that there was nothing left to his imagination. The system they found worked remarkably well. A point in which their practice corresponded with that of Austria and Denmark was the selection of separate tradesmen for each part of the work. This general practice had, however, been of late somewhat departed from. It entailed extra labour on the architect, but it was open to question whether he should shirk that little extra trouble, considering the increased excellence of the work. As to the ownership of drawings, he did not ever remember being asked for any drawings beyond those for drainage, &c. There was a growing demand on the part of public bodies for having complete copies of the drawings of the town buildings. It was useless to attempt to keep drawings from a client if they were obliged to give a complete set to every little local authority. Two Bills were now before Parliament containing provisions which the Legislature should think twice about passing. One concerned the sanitary inspection of buildings. The other provided that plans of all buildings should be lodged with the local authorities, and also that any one, on paying a small fee, could obtain a copy of these plans. It was quite worth their while to consider what ought to be done in this matter.

In answer to a question, Mr. HONEYMAN replied, as to responsibility, that they were the contract to all intents and purposes; and there was no responsibility with the original quantities, the work being measured at the end.

Mr. BOARDMAN, of Norwich, said that in his experience they only gave to clients drawings of drains, water-pipes, &c. The chairman of the governors of the Norwich and Norfolk Hospital (a building costing about 50,000*l.*) asked him what he would charge for supplying a set of plans of the hospital.

Mr. BATEMAN, of Birmingham, said that they would be glad in the provinces if some uniform action could be taken on the vexed subject of quantities. Practice in this matter had been for so many years divergent that he had little hopes of a change. The practice in London was nearly universal to employ a surveyor, and local practice was for the architect to be his own surveyor. He failed to see that any error in the quantities on which the contract was based should not be subject to revision when the work was finished—for this reason, because he had known high-minded surveyors put their hands in their pockets to reimburse the builders for works omitted in the contract, thereby saving the client's pocket. Whether the architect or a surveyor should take out the quantities seemed to be a matter turning on convenience in their local practice. In his own practice of between thirty and forty years he had always taken them out for works of moderate dimension; where it came to works costing 30,000*l.* or 40,000*l.* it would be impossible for the architect to give the time to it. The Institute had hitherto taken up firm ground on the question, and there was a feeling that architects who took out their quantities were in consequence under some kind of professional ban, and were thus placed at a disadvantage. He did not know that this was actually the fact. In his own mind, however, he had no doubt that, whether taken out by the surveyor or the architect, they should form in all cases the basis of the contract, and this for reasons before adduced. In the early days of his practice he had

known errors of considerable magnitude to occur. As to drawings, he had been asked for a set and had charged thirty guineas for a copy of them.

Mr. PRATT asked whether it was the custom among architects generally to ask builders at the end of a job to deliver up all the drawings supplied to them during the work? It seemed to him only right and proper, and in the event of the client asking for drawings, these could be given to him.

Mr. HOWARD COLLS, speaking from the point of view of a contractor, said that the position of the builder was a simple one. If an architect took out his own quantities they should, without reservation, form the basis of the contract. Architects' quantities, however, generally caused trouble; they were something like quantity-surveyors' architecture, not of a high character. Builders would never complain of architects taking them out if they were made *bona fide* part and parcel of the contract. They did not like it all the same, and thought it should be entrusted to some one who would act between the two. An architect would be more or less on the side of his client. (No, no.) They ought not to be, but it was only human nature, and, therefore, more than ever necessary a middle man between the architect and builder. The form of contract was important. A form had been arranged between the Institute and the Association of Master Builders, which was perfectly fair and straightforward, arrived at after an immense amount of labour. He was sorry to say that many architects here tried to shirk its use, and make builders sign one of their own. A shipowner would laugh at being asked to sign any other agreement than that of the charterers. Of course builders ought not to laugh at architects, but if they did it could hardly be considered derogatory to the profession itself. There had been much controversy about this, and it was difficult to speak calmly on the subject, for builders felt themselves hardly treated.

Mr. STANLEY BIRD, President of the Master Builders' Association, on being requested to speak, said he would add a word in confirmation of what Mr Colls had said about forms of contract, a subject which the builders and contractors of the United Kingdom took much to heart. He spoke more especially of provincial builders, who had long groaned under great injustice in having such contracts forced on them without being able to resist. Only since the formation of the Builders' Association had they been able to get introduced the new form of contract. They owed a debt of gratitude to the Institute for framing it. He must say it was not quite perfect, and that it needed some little alteration, as it did not sufficiently set forth that the quantities should form part of the contract. It had been said that it was difficult to find work enough in the country for a surveyor, but if country architects took out their own quantities, that was no reason why they should not form part of the contract. On the present occasion he believed it was the custom for the Institute to elect a fresh council. When elected he hoped they would consent to receive a deputation with regard to this subject, which interested builders and contractors so nearly. The question of arbitration also required settlement, and it was a subject on which they ought to have the opinion of the Institute.

Mr. LINCOLN said he thought little more would be heard about the question of quantities if they were paid for by the client. He then instanced a case of the running up of charges by a surveyor.

Mr. T. M. RICKMAN observed that if architects could tell stories about surveyors, that surveyors could also tell them against architects if they pleased.

Mr. WYATT PAPWORTH remarked on the different terms of the liability of contractors in different countries, viz., twenty years, ten years, and in England not more than seven years. Contractors here could evade the responsibility by becoming bankrupt. Did the same thing occur abroad?

Mr. T. BLASHILL said he thought that the system in regard of quantities would continue to be followed in London as heretofore. It was advantageous to a client to know as nearly as possible the amount of money he would be called on to spend beforehand. Many had only a certain amount to spend. Thoughtless people often looked on a client as a man with unlimited command of money, but it was a serious thing to have to go and tell a client that, owing to a mistake, there was 500*l.* to pay; and this was one reason alone why architects should not take out their own quantities. This safeguard was lost if quantities were made part of the contract, and the necessity for the existence of surveyors would be to a great extent done away with.

Mr. ALDRIDGE, of Liverpool, said that if they sat all night discussing the matter there would not be unanimity of feeling between London and country architects. Quantities had been forced on provincial men by circumstances rather than taken up by them as a matter of pleasure. There were no country surveyors, or at any rate very few, and in small towns it was not desirable to send out their drawings to a surveyor. He had not a word to say against London surveyors. The client was not the surveyor's but the architect's client, and the surveyor had not the same interest in going into the minutiae of the work and keeping the cost down as the architect had, who, going piecemeal into the work and dissecting it thoroughly, was able to keep the cost down and often save the client a considerable amount of money. The speaker then

hinted that he could give cases of how the cost had been considerably swollen by London surveyors having taken out the quantities. The very circumstance of an architect taking out his quantities tended to more completeness in his drawings.

The CHAIRMAN remarked that human nature was finite, and that the matters for argument of Mr. Cates's paper were, as he had before pointed out, infinite, and the discussion had drifted about and taken up all the time at their disposal. The desire of the architects in this country was to make an absolute friend of a client, not one to be operated on and bled for a season; but they endeavoured to consult his wishes and sympathies as far as possible, and, as happened in many cases, make him a friend for life. That was the position they, as architects, desired to have, and they would rather forego all the protection of the Codes Civil and Napoléon if they could obtain that position. A shifting scale of remuneration seemed to him undesirable, and likely to lead to every conceivable kind of dispute, and therefore our own rough and ready, but generally fair rate of 5 per cent. seemed best, and the French appeared to have come to the same conclusion in spite of the tariff and Code Napoléon. In the matter of quantities, architects had too much business as it was. It could not be helped, but they should do their best to the client to avoid it, to debase the business and exalt the art. Three gentlemen in a back room were just as likely to mislead the Courts of law as the counter-statements of experts in the Court itself. The remarks of the judge were often misplaced, and it was not right in judges to complain of having to do their duty.

A cordial vote of thanks was then passed to Mr. Cates for his paper.

Mr. CATES acknowledged the vote, and, replying on the discussion, explained that the responsibility for the wide range of subjects included in his paper rested with the Council and not with him. Feeling that the question of quantities had been exhaustively discussed in the past he had endeavoured to exclude it as much as possible, but, notwithstanding this, that question had engrossed the chief attention that evening. One point of very great importance had been raised by Mr. Bateman and others. Some prominent architects appeared to think that those who took out their quantities were looked upon by their London professional brethren with less favour than those who did not. He could assure them that such was not the case, and, in some instances, such architects stood higher in estimation than others as practical men. The whole question turned on whether the quantities should be made part of the contract. So soon as this was done, the rate of commission would be reduced to a mere clerk's pay.

#### WEDNESDAY, MAY 7.

The third meeting of the Conference was held on Wednesday, at Conduit Street, when Mr. Edward P'Anson presided. The following paper was read:—

#### The Tenure of Land for Building Purposes.

By THOMAS BLASHILL, F.R.I.B.A.

The tenure of the land upon which buildings are erected is a matter of the greatest public importance, and one which, from various causes, is now receiving an unusual amount of attention. So far as it affects the condition of buildings, their capacity for improvement, and their influence upon owners, occupiers, and neighbours, it is a question belonging peculiarly to our own experience. We should therefore be able to deal with it practically, and unbiassed by considerations of class or party.

With the view of assisting us in the discussion of this subject, inquiries have been made of our foreign correspondents as to the customary tenure of building land in the chief European countries. We find that in France, Germany, Austria, Denmark, and other countries, buildings are erected only upon land which we should call freehold, so that there is no such question as that which is now before us, and we can learn nothing from their experience of different tenures. If our country resembled any of these in its capacity for business, and in the prosperity of its population, their example would be of great value, but in existing circumstances we shall probably do well to study the subject from our own point of view.

We shall, no doubt, agree that, in principle, it is best for a man to be able to build upon his own freehold land. He ought to be the best judge of his requirements and of his means. If he builds on speculation, or for investment, he ought to know best the wants of his customers, or tenants, and the price at which they will buy or hire. It is most to his interest to keep the premises in good repair, to alter them judiciously, to enlarge or rebuild as circumstances require. If his judgment is good, the gain is his; if bad, the loss is his. But if, through the tenure of his land, he has to submit his judgment to some other person, he is very likely to be fettered in his action, and may have to pay heavily for liberty to do what he considers best. This freehold tenure is what each would think best for himself. It is also best for other people if we add the restrictions that are required in the public interest, and those which may be desirable between neighbours for their mutual advantage.

The Architect, May 10<sup>th</sup> 1884.

AN OLD MANOR HOUSE.

HOUSE, BARKING ROAD, CANNING TOWN, E.

WILLIAM G. B. LEWIS, ARCHITECT

The tendency of modern legislation has been to promote the conversion of other ancient tenures into freeholds; and to make the freeholder, though he may be only a tenant for life, more free in the use of his land. If the land is in London or any of our larger towns, the use which he makes of this freedom is to dispose of it on building lease, so that the property, which before might be tied up only for the present generation, becomes tied for the duration of about three generations to come. Our subject may, therefore, be limited to the forms of leasehold tenure on which land is now let for building purposes, and specially to the system of terminable leases, which has for a considerable time prevailed in London, and is being extended to our largest provincial towns. And it will be useful to bear in mind the convenience of freehold tenure in judging of other modes of holding building land.

#### *Building on Leaseholds.*

Now the system by which a person intending to build hires a piece of land instead of buying it, and covers it with buildings which his representatives must at the end of ninety-nine, or ninety, or eighty, or perhaps only sixty years, give up in tolerable repair to the ground landlord, is one which is peculiarly liable to be misunderstood by those who are unacquainted with such business. As a subject for a telling speech or a smart article, we are familiar with the picture of rows of houses run up to last only so many years as the lease will endure. They are supposed to fall in pieces about that time, after having been during their later years the disreputable means by which the middle man has satisfied his "greed" at the expense of the unfortunate tenants. At the end of the lease the holder is a poor widow who is solely dependent upon the property, and finds it "confiscated without any compensation" by the ground landlord, who, moreover, endeavours to make her restore it to a habitable condition.

It is hardly necessary to point out that these pictures give no true idea either of the nature of the transaction or of its practical results. The deliberate building of a house to last for about the term of the lease is a popular fallacy. The buildings with which it is connected are the work of the worst class of speculating builders, who have no interest in or care for the length of the lease. They build to sell, and they hope that their own interest will cease as soon as their buildings are finished. Under such conditions they would build as badly on their own freehold ground, or worse, for they would in that case be free from the supervision of a ground landlord. Houses of this class seldom last for half the usual term of a building lease without serious dilapidations. I have had to procure their demolition before they were finished, and have known them to become uninhabitable before they were occupied. Some of the worst of these buildings have been built on the speculator's own freehold ground. When houses are manufactured in large numbers for sale, it is highly improbable that the buyer can exercise any useful supervision over their erection, and nothing but building regulations of a stringent character can prevent this kind of work, or give a chance for the respectable speculator to compete with those who have no desire to build substantially—perhaps no knowledge of the ordinary principles of sound building. The regulations in our Metropolitan Building Acts are more lax than those of many provincial towns, and far behind those of the large Continental cities. They may, nevertheless, be quite equal to the demands of the public, for a very large proportion of our population do not practically call for well-built houses by showing a readiness to pay for them.

But the man who builds for his own occupation or investment, and intends to keep the property in his family, will hardly have the folly to build in an unsubstantial manner, for any serious defects in construction will show themselves within the term of a building lease, and the penalty would fall upon him or his near descendants. A man of ordinary prudence, having built substantially on his leasehold ground, will, if he cares more for his posterity than he does for himself, lay by a sum which will probably be only a few shillings per annum to form a fund that shall, at the end of the term, be equal to the original cost of the building. If (as may be very reasonable) he cares more for himself than for his remote and problematical descendants whom he will never see, he will allow the matter to take its course. At every change of ownership, whether by inheritance or by purchase, and at any time during the continuance of the lease, the temporary leaseholder will know how long the property will remain to him, and how far that influences its value. If he has the ordinary good fortune of the London leaseholders of past times, he will be in receipt during the latter half of the term of an income from the property very considerably in excess of that calculated upon by the original lessee, while he will still be paying only the original ground-rent of one-half or one-fifth of the increased value of the building plot.

Meanwhile the ground-landlord has been unable to share in this prosperity. If the property be in central London, he may still be receiving the ground-rent fixed early in this century, when men of business lived over their shops and offices in streets lighted by oil-lamps, before railways, free trade, telegraphs, cheap postage, cheap newspapers, and all the aids to commerce which have marked the last two generations were in the least foreseen. The ground-landlord in one of the suburbs may still be limited to the rent fixed when that suburb was an outlying village, without

trade, without cheap communication, and separated from the great centres of business and of pleasure by roads infested with footpads by night, and, according to modern notions, hardly passable by day. The improved rentals, which he may never live to enjoy, are probably shared by middlemen, representatives in different degrees of the interest of the original lessee.

In discussions of our leasehold system these considerations are generally overlooked. In a paper in the *Fortnightly Review* for March, by Mr. Broadhurst, M.P., who has taken a great interest in this subject, and whose Bill for enabling leaseholders to purchase the fee simple was lately before Parliament, there is this story, which the writer evidently thought to be a strong support to his case:—

"A person had bought the remainder of a lease on a West End estate, and towards the end of the term he sought a renewal. The terms offered were as follow:—1. That the original ground-rent should be increased from 10*l.* to 50*l.* per annum. 2. That a fine of 1,400*l.* should be paid for the privilege of renewal. 3. That 500*l.* should be expended in repairs by the lessee."

Now, it will strike men of business that the thing which would have shown whether this was fair to the lessee or hard upon him, viz., the actual present value of the premises (which he had, no doubt, bought prudently, but which he seems to have neglected), is omitted from these particulars. The same fault usually marks such stories as these, by which a lessee who desires to have a benefit that does not belong to him practises on the good nature of a sympathetic member of Parliament.

#### *Terminable Leases.*

Every loss which a lessee may sustain can be estimated in pounds and stated in figures. We shall probably be of opinion that the losses said to be incurred by the holders of terminable leases (which have been managed with ordinary prudence) will not bear that test; but it does not therefore follow that terminable building leases are desirable as a system and to the extent to which they are now being adopted. When the original parties to the lease have passed away the property has to be managed for some two generations under the covenants made by these dead people, and with strict reference to the supposed interests of a reversioner who may not yet be born. The character of the neighbourhood, the circumstances of the property, may be entirely changed, and the only person who can adapt the premises to the new conditions is the then holder of the lease, who, besides, may have his own means of increasing the value of the premises to himself without any real injury to the ground landlord. He may even desire to rebuild or greatly improve the premises for the benefit of both parties. In any case he must apply for the consent of another person, who may exact an enormous consideration for it, or may, from ill nature, refuse point blank. If he is not really in bad hands, he may find that through the nervousness of trustees, or the caution of professional advisers, he is so hampered in his arrangements that his scheme has to be abandoned. If his lease is about half run out, the cost of extensive additions will fall so heavily on the short remainder of it that he may then be tempted to build in a flimsy manner. When the lease draws still nearer to its end, it is decidedly against his interest to keep the premises in proper repair, and the Legislature, in passing the Conveyancing Act of 1882, has taken such care of the interest of such persons that it will now be exceedingly difficult for the ground-landlord to compel the performance of repairing covenants. Hence arises much of the present outcry against leasehold property, though it will be found that much of it is really due to the indifference of freeholders, who are, perhaps, only tenants for life. These results of the system of terminable leases are a matter of public concern; for it is to the public injury that large areas of the metropolis should be checked in the ordinary progress of improvement for the term of two generations. It is a matter well worthy the careful consideration of those most intimately concerned with the working of the system—the ground-landlords and their professional advisers. In my own experience I have found that in dealing with the larger corporate bodies, and with the ground-landlords of large private estates, the tenant has usually been treated not merely with fairness, but with the liberality which one likes to see accompanying the sentiment of ownership. I have also known the owners of a small estate make a great sacrifice to relieve an unfortunate tenant. But there are some large public bodies who are said to be not so well advised that they can safely be trusted to act liberally, and small people cannot be trusted to any great extent.

#### *Compulsory Purchase of Leaseholds.*

I do not, however, think that we shall approve recent schemes for the compulsory purchase of leaseholds. Such schemes would enable a lessee who desired to improve the property to become the owner of it, and so far that would be to the public advantage. But it would open the door to a class of schemers who would use the enfranchised leaseholds as a means of injuring estates on which none of the evils now complained of really exist. It would be a strange mode of rewarding the owner of neglected leasehold property if we enabled him to buy at the price which a willing

purchaser might give for the rookeries which are the result of his neglect.

Before we consider improved forms of tenure it may be interesting to give the view of the only permissible form according to the ideas prevalent in Spain. Senor Belmas, writing from Madrid to Mr. Phené Spiers, says, "Every one who wishes to build begins by purchasing his ground, and, without being the absolute proprietor, no one would think of building even the least thing. On the contrary, if by chance what is done in England were known it would astound every one." Are we in London prepared to return to that primitive system? or to pass any Act of Parliament that would practically enforce it? There is a Royal Commission now sitting which will doubtless tell us how it is that in England—the most prosperous country on this side the ocean—men will not, as a rule, even when they might, acquire the freehold of the houses in which they live; why, when they happen to be the proprietors of their cottages, they sell them on the first opportunity; why the Englishman devotes a smaller proportion of his income to house-rent than any other man; why house-rent in London is cheaper (like for like) than in any important Continental city; and how it happens that the average London householder does not live more than three years in the same house. If it is argued that any of these things are due to our system of terminable leases, they will find that they exist, and have long existed, so far as a comparison can be drawn, quite independently of them. If it is argued that the slums of our great cities are due to the leasehold tenure, we may ask how it happens that evils quite as great have arisen in the great American cities, from New York to Chicago, where no such leases exist; and why the slums of Paris, though less extensive than our own, show, if possible, more shocking phenomena.

For our own part, we have to deal with things as they exist. In a state of society in which it is more convenient to build upon leasehold land than to buy the freehold, we must consider how much of the convenience which belongs to freehold can be grafted upon the leasehold tenure, especially in the point which most affects the public interest, which is to secure to persons having control and substantial interest in buildings reasonable liberty and encouragement to improve the property.

#### *Provincial and Northern Customs.*

There are, in various parts of England, customs of holding land subject to chief rents or fee-farm rents, about which I hope we may hear something from those who have practical experience of their working. The effect of such terms is to create what we might call leases in perpetuity, if such things were legally possible, and the best example of this on an extensive scale is found in Scotland, where building land is commonly let on what is called a "Feu charter." By this system the tenant is bound to keep a building upon the land of twice the annual value of the amount of the rent. The rent does not increase, but it is easily collected, and forms in Scotland the best available kind of investment. We may hope to hear from some of our Northern friends the advantages and the disadvantages of their system; but it appears that if this tenure were known here, and the habit grew up of investing in such securities, the objections to building leases would disappear. It appears also that the ground-rents under such a tenure would rise very considerably beyond the rates that are now paid. The increased rent should not only remunerate the ground landlord for the loss of the reversion to the site at the end of a terminable lease, but it would include some share of possibilities of improvement which are prevented by the present system, to the loss of both lessor and lessee.

There are certain classes of ground-landlords, such as corporate bodies, charitable trusts, and some heads of families who might not be tempted by these increased rentals. But the ordinary owner of land for investment may well consider the advantage of such a system of letting building land. I feel sure that its adoption would lead to the application of the same system in many cases where a lease has so many years to run that the present owner of the freehold cannot expect to enjoy the reversion. In such cases it would be easy to ascertain the value of that reversion, and to fix an increased ground-rent which would give the present owner the full income which his land may now be worth. Probably such leases would be made renewable periodically at a fixed nominal fine; but the precise shape which the legal business would take is a matter for lawyers rather than for surveyors.

I understand that in Aberdeen a system has grown up of letting building land for a term of sixty years, the ground-rent to be doubled after a lapse of the first twenty-five years, for some reason which I fail to see. If we admit the principle of an increasing ground-rent, it would seem more fair to provide for a revaluation of the ground, say three or four times in a century, and at such times renewing the lease at the new rent. This would make the leaseholder in the same position as the holder of freehold land, except that he must allow the ground-landlord to share in the increase (and possibly in some cases the decrease) of the value of the property.

There is in the West of England a very important question arising out of the local custom of building upon leases for lives. Whatever the advantage of such a tenure may have been in past times, its uncertainty conveys to us the idea of a gambling trans-

action, such as must be highly prejudicial to business. It is, of course, possible to insure the lives, and every careful lessee would do so; but the cost of such insurance, and some share in all the other inconveniences of such an uncertain tenure, must fall on the ground-landlord, and it seems surprising that such a custom has not been abandoned in the interest of both parties.

In bringing this subject before the Conference, I have endeavoured to touch upon the questions which are of the greatest importance; but I do not suppose that I have included everything that is worthy of consideration. We can have (as I have hinted) no political views; we are, therefore, the more able to place the whole matter in its true light, so that defects in existing customs may be remedied by those who are practically engaged in the management of these transactions. Possibly, also, those who desire to deal with questions involved in the ownership of land devoted to building purposes may learn something in the course of this discussion that will help them to clear and just views of a subject which at present does not seem to be very well understood.

#### *Discussion.*

Mr. JOHN HONEYMAN said he believed there was a great deal of misapprehension generally as to the working of the leasehold system in London and elsewhere. Speaking for himself, he must confess he felt greatly prejudiced against it; but the last thing that would occur to him to suggest as a remedy for existing evils would be Parliamentary action. One of the chief evils seemed to him to be the power of the ground landlord to interfere. In that respect their system in Scotland was no doubt superior. There was no interference as long as there was sufficient value on the land to insure the payment of the feu, and it was hardly possible to think there would not be that sufficiency. The system was equivalent to a perpetual lease. The land was held to be the absolute property of the feuar, conveyed to him on the condition of the payment of the feu, and as long as he paid it there was no interference with the feuar, unless he came under certain covenants to do things under the feu-charter, which was often the case, viz., to secure the amenity of any locality, a condition that only dwelling-houses are to be erected, that the houses should conform to a certain plan, that a certain building line should be adhered to, &c.; as long as these conditions are kept, the land practically becomes the property of the feuar. It was a sort of compromise between the Spanish system absolutely to buy the land, and the English system. But it did not involve the expenditure of so much capital, and there was this immense advantage to the proprietor of the land, that he had no trouble in the collection of his feu duties, and no trouble of any sort. It was a question whether freeholders wishing to dispose of their land might not adopt the system in England. There would be a high ground-rent secured, a vast deal less trouble, and a freedom from the litigation which often arises on the termination of a lease. It was a question of assessing the value; but, as Mr. Blashill said, that was easily worked out. It was quite a mistake to suppose that, if a change were made, it would be cheaper for the community. Of course it would not; for if owners were going to give the land in perpetuity, they would charge more. It would be better for the architects in the country if the holdings were perpetual, and it would also be better for the ground-landlord.

Professor KERR remarked that Mr. Honeyman's idea that a change in value would be effected by a commercial transaction substituting an interminable lease for a terminable one was a mistake, for the value of anything was what it would bring at the time. A perpetual lease was a thing often granted in England, and the ground-rent was simply regulated by what the land was worth at the time. The terminable lease had grown up in England, not in any way arbitrarily, but as part of the business of the country. Scotland was far behind England, and it was a mistake to make any comparison between the two in a system of this kind. We had the leasehold system in London, where its evil effects were most noticeable. No doubt the disadvantages of the system were great and crying, and he agreed with Mr. Blashill that it was difficult to get rid of them. But he did not agree that Parliament ought not to interfere. The absolute freedom of landlord and tenant in the matter of contract was in theory very pretty, but in practice it was a matter that required regulation. When the typical landlord finds he has a tenant in his power, he is apt to use that power against his tenant. What he (Professor Kerr) thought would meet the ends proposed by the Broadhurst and other Parliamentary Bills would be an Act giving a statutory right of renewal of lease instead of purchase, in order to further the improvement of property in the interest of the possessors, and that would not interfere with the rights and prerogatives of the landlord. The value of the land was simply made by the public, by the extension of the town and the interests arising out of that extension, and increase of traffic. These things raised the value of land. The Crown, he thought, acted unwisely. He believed that Messrs. Howell & James in Regent Street had spent thousands of pounds on their premises, and applied for an extension of lease as an encouragement to lay out more money on the place, and it was flatly refused. In another case, also of Crown property, the premises were absolutely worn out, and an extension of lease was asked for and refused, and a handsome building had

all the same to be erected. In London, he believed there was a desire on the part of the landlords to stand well with the tenants. The Duke of Westminster's tenants were well satisfied with the terms on which renewals of leases were granted. The consequences of the extreme complications which existed in London leaseholds were shown in Regent Street. Strangers might fancy it was a street of beautiful houses. But the houses were merely whitened sepulchres—sanitary and other matters were bad, little rent could be derived from the upper floors of the houses, the occupiers took what they could get, and that was hardly anything. This was produced by two causes, by reason of the extreme complication by which any improvement of the tenant's was heavily handicapped, and secondly, because the house having been originally constructed in a flimsy way, the land was worth more than the shop and premises on it. The leasehold system seemed to have reached its absurdity in Regent Street. If the lessee really requires to renew the lease for the sake of his business, the landlord usually raises the rent by selling the man his own business. The administration of the law of dangerous structures had of late years become a considerable grievance to tenants, for the reason that such structures were likely to be houses near the end of a lease; and when the district surveyor, as the instrument of the Metropolitan Board, condemns part of a man's house, he is invariably told that the lease has only a year or two to run. He (the speaker) had put the question was there no remedy, no means in law or equity which could make the landlord rebuild the bad part of the house? There was, in fact, no remedy. If only a week before the end of the tenancy, the tenant must deliver up the house in full tenantable and habitable order to the landlord.

Mr. JOHN HEBB said it seemed to him that if there was no other argument against leasing land than that advanced by Professor Kerr, that alone was sufficient to condemn it. That it should be possible for a freeholder to go to a district surveyor to get a house condemned in order that he might enter into possession sooner was bad; that this had been done was certain. But there were other accounts on which the system might be condemned, that it led to flimsy, unsafe, and unsanitary building, &c., had to be demonstrated. Mr. Blashill tried to show that people preferred to live in houses hired, and not their own, but it should be attributed to the Englishman's dislike to live in one place long. If a person expended more on a property than he covenanted to do, the landlord reaped the benefit; he did not. Such conditions were also made that sometimes it was actually a breach of covenant for a tenant to improve his landlord's house. Legal action had been taken in a case of the kind. Such a system could not be a good system. It was not either a voluntary system, or something might then be said in its defence. If a man wanted a house in particular parts of London he must take a leasehold house. You must give up the house, with all its improvements, on the expiration of the lease. Corporate bodies and ecclesiastical bodies had no respect for persons. They all let to the highest bidder and had no respect for the late lessee. If a lessee could not renew his lease, his business was often extinguished, if only perhaps by having to move across to the opposite side of the street. The ecclesiastical authorities were notorious for this want of respect. Next came the City companies, who exacted the last penny.

Mr. WYLSON made some remarks on facilities for street improvements.

Mr. ARMSTRONG said he believed new property, especially a great part of suburban London, was being mortgaged for more than its worth. It was a serious thing that you could not improve your property without going to the freeholder, which drew down on you his solicitors and surveyors, which meant expenditure of money, every penny of which went in fees to the solicitors and surveyors, and not a penny into the landlord's pocket. These gentlemen ought to be paid by those whose interests they looked after.

Mr. T. OLIVER, of Newcastle-on-Tyne, said that in the north, more especially speaking of Northumberland, land was bought and sold as freehold. Being as it were between Scotland and England, they got the benefits and disadvantages of both systems. There were some instances where they had the feu system, but under another name, and cases also where they had the leasehold system, as in London. The Ecclesiastical Commissioners held a good deal of land in the county of Durham, and they had lately made arrangements by which they could enfranchise property where desired to do so. The current of popular opinion was quite in the direction to justify Mr. Honeyman saying they did not wish for Parliamentary interference.

Mr. MINYARD, speaking as a speculative builder, said he could build better houses on his own freehold land than on land under the present tenure. His experience was that convenience of position, rather than the merits or demerits of the building, carried the day with the public. And, again, in regard to two houses similar, except as regarded amount of rental and good construction, the house which came 10% cheaper than the other would be chosen. Why did not the public build for themselves in the same way as they did everything else—their tailoring, &c.? It was by reason of not being able to buy freeholds, and because leaseholds

were hampered by too many adverse conditions. Value of land was determined by present tenure. Land worth 8% an acre, as good market garden land, he had put up property on, and stood committed to pay the freeholders 2,000% a year. Thus an artificial famine price was created for land, and at the end of the term one was swept out of it all. He sold the property, but his selling did not release him from responsibility to the freeholder, who could sue him and his heirs if necessary. It was so exceedingly difficult to get new plans and elevations passed, that it was the easiest way to go on in the old ruts and grooves. He thought it was admitted by all in the room that the present tenure was bad. Perhaps landlords would grant in perpetuity on condition of an increased ground-rent. He thought freehold purchase should be made compulsory, as in the case of land required for railways. If every one built on his own freehold, he would build according to his own tastes and requirements, and the present monotony of our streets would give place to picturesqueness.

The CHAIRMAN said that in the course of an extensive practice of surveying he had acted for corporate bodies, and, though they did look keenly after their own interests, they were not illiberal, and did not attempt to squeeze out the uttermost farthing. Neither was it the case that when a lease expired you would not get it renewed. They rather attempted to help the tenant in possession. His view was that every consideration should be paid to the owner of the land; and if it were said that circumstances—the public, the traffic, &c.—increased the value of the land, he did not hold that, because circumstances had changed the value, the owner was not to have the full and entire value of that change. In London building was a thoroughly commercial speculation. Builders took land with their eyes open; they knew precisely what they were going to do, and how much they would make by investing their capital and energies in it, and think of little else. The freeholder contented himself with 3 or 4 per cent.; while the builder was making 7, 8, or 10 per cent. In almost all building transactions, even with great corporations, city corporations, who built large offices—but would not build on freehold—it was the case that directly the lessee got his lease he mortgaged it, and even then made his percentage. Londoners had not any more trouble in collecting their rents than there was in the feu system. It was not, however, his intention to formulate any principle to supersede the existing system; what he had meant was to put before them the results of his experience.

Mr. PANSON then vacated the chair to be in time to keep an appointment, and in his place the chair was taken by Mr. Fowler.

Mr. T. H. WATSON said that what was wanted was not an absolute right for any person in a building estate to purchase any lot, for he might do something to injure or annoy his neighbours on the estate, and that seemed to him to be the principal defence of the leasehold system.

Mr. W. EVE said one point had been lost sight of on the side of the leaseholder, and went on to point out that the leaseholder might invest the sum of money saved by the purchase of the leasehold instead of the freehold; as a leaseholder he was not to be pitied if he had neglected to take the ordinary caution of guarding against eventualities.

Mr. BATEMAN referred to the system adopted in Birmingham, on land belonging to the corporation; although the term of the lease was about seventy years, tenants were willing to erect expensive buildings on the site.

The Chairman, Mr. FOWLER, in summing up the discussion, said that for some years he had had the management of a building estate, and so spoke with some experience, and the conclusion he derived from that experience was entirely adverse to the views of the Broadhurst and similar Bills. The meeting then adjourned.

#### Associates and the Institute.

In the afternoon there was a visit to the Architectural Association, an institution which is deserving of more support than it has hitherto secured.

At 4 p.m. a meeting of Associates of the Institute was held at Conduit Street. Mr. R. M. Roe was chairman. We are unable to find room for the speeches this week, but the following resolutions were carried:—

I. "That in the opinion of this meeting, the Royal Institute of British Architects, just completing its fiftieth year, should become more generally representative of the profession." Moved by Mr. Woodward, and seconded by Mr. Hugh McLachlan.

II. "That in furtherance of the foregoing resolution it is desirable that some voting power shall be conferred upon the class of Associates." Moved by Mr. G. Richards Julian, and seconded by Mr. J. Osborne Smith.

III. "That the Council and Fellows of the Institute be memorialised to consider the best means for revising the Charter and By-laws to give effect to the wishes of this meeting as expressed by the resolutions." Moved by Mr. H. Hardwick Langston, and seconded by Mr. Sidney Young.

IV. "That a Committee, not exceeding twenty-one members, be appointed by this meeting to carry out the objects of the foregoing resolution." Moved by Mr. S. H. Blagrove, and seconded by Mr. G. H. Pryce Cuxon.

V. "That a Committee of the following gentlemen (with power

to add to their number, not exceeding twenty-one) be appointed to prepare and present the memorial, and take such further steps as may be necessary, seven to form a quorum:—Messrs. G. R. Julian, Hugh McLachlan, H. H. Langston, Sidney Young, S. H. Blagrove, H. P. Monckton, J. Osborne Smith, E. E. Hollis, J. P. Power, J. Malcolm, T. E. Munday, and G. A. Pryce Cuxon."

VI. "That this meeting believes that if the Charter be altered, powers ought to be given to country members to vote by letter or otherwise, and in the interests of these members the question of payment for quantities should be taken into consideration." Proposed by Mr. John B. Gass, Bolton; seconded by Mr. H. H. Stannus.

The fourth meeting in the evening was largely attended, owing to the circumstance that papers were to be read on three such renowned architects as the late G. E. Street, William Burges, and Eugène Viollet-le-Duc. The first paper was written by Mr. Beresford-Hope, but in his absence it was read by Mr. A. W. Blomfield:—

#### George Edmund Street.

BY A. J. B. BERESFORD-HOPE, M.P.

The notable feature of the distinguished life which I am called upon to commemorate was its harmonious, calm progressiveness. No lurid glare of romantic adventure lighted up or obscured the career of George Edmund Street; no feverish throw for the last stake, despair and ruin shaking the dice against success and honour, is there to tempt us to revel in the fallacious indulgences of word-painting. No dreary periods of obscurity gave fierce delight to unexpected bursts of hot prosperity. Ups and downs, of course, there were, success in this competition and disappointment in that one; carping criticism, and all other such episodes of rainy weather and storms which freshen the atmosphere of public life, and upon which it is the duty of every one to reckon who makes his choice for a public position. But in his professional career, which is all with which I am here concerned, Street's life was eminently one of a prosperity deserved, fought for, and achieved by a rare combination of industry, realised duty, buoyancy, will, and genius, in alliance with those gifts of manual dexterity in sketching so useful to the architect, who has always to be making himself understood by that Philistine public to whom elevations are masks not faces, plans deliberate frauds, sections aimless trifling.

The pupil of Owen Carter, of Winchester, in 1841, and then, in 1845, of George Gilbert Scott, Mr. Street found himself in 1849, and at the age of twenty-five, an architect with his own way before him to carve out, and so he carved away for every day of two-and-thirty years, till, after he had passed through the portal of the Royal Academy, that way ended in Westminster Abbey, where a funeral, only not a State one in the technical sense of the word, conducted to his grave the President of the Institute of British Architects and artist of the grand pile of National Law Courts. He began, as I said, to practise in 1849, at Wantage; in 1852 he went to Oxford, having been named Diocesan Architect by Bishop Wilberforce; and in 1856 transferred himself to London, which he never left—so nobly simple was his career, which would hardly have been possible except in some great centre of life. It owed none of its success to dexterous compliance with popular tastes. Perhaps in his younger days our friend was a little too fond of emphasising his independence. Street was a man of twofold convictions—a Gothickist and a religious architect, as the Church of England teaches religion. Here let me for a moment forget that I have for my audience the Conference of Architects, and travel back in memory to some far-off meeting of ecclesiologists, at one of which I had the great privilege of making Street's acquaintance.

#### Faith and Architecture.

As an ecclesiologist among ecclesiologists, I claim for Street—and not for Street alone, but for the owners of other cherished and honoured names, some still with us, and others resting from their labours—the credit of a rare example of truthful conviction, consistently acted out in the engagements of a lifelong career. I do not intend the slightest reflection on another theory of the architectural life; I honour the other conception of the architect's mission, that of subordinating personal predilections to the wants of the client, always with the reserve, of course, that the construction shall be good, and the design not ludicrous. The world could not go on without the existence of such an understanding. Indeed, the power of accommodating personal faith—faith, I mean, in things terrestrial no less than celestial—with professional want of prejudice, without forfeiture of self-respect, makes the world richer in its store of moral treasure. But yet I must be allowed to reserve peculiar personal admiration for the architect whose life of art is one long fearless creed, and who refuses to win fame or profit by ways adverse to the propagation of what he believes the highest truth. Architects of this type have been eminently the growth of England, and of the English Church of this century. Eminently—I say no more when I think of Pugin, to mention but one name. The ecclesiological promise of France seemed as bright as ours forty years ago. It has been interred in chill silence at the civil funeral of Viollet-le-Duc, while from the graves of Scott and Street at Westminster the voice of sure and certain

hope rises that our mission shall go on and prosper. But let me not stray into controversial by-ways. I could not refrain from these words without leaving my picture of Street incomplete. To say more might be needlessly to raise debate. The man for whom I have claimed this merit was no pale, spiritless dweller among the tombs, but, up to all but the last day, a stalwart Englishman of vigorous vitality, robust constitution, unflagging spirits, beaming with the beauty of healthful activity, awake to the calls of that life in which personal capacity ministers to public prosperity.

#### Mr. Street's Principal Works.

Let us briefly travel over the list of some of his principal works, after which I may offer a few remarks on the lessons which they teach. I dare not open the multitudinous roll of churches which have passed under his restoring but reverent hands with no detriment, except, it may be, in those early days when all were learners together. It is enough to name some principal works, such as the south transept of York Minster, Carlisle Cathedral, Kildare Cathedral, St. Canice Cathedral at Kilkenny, the noble churches of St. Peter Mancroft at Norwich, Clun, Welshpool, and Hythe. The recasting of Christchurch Cathedral, Dublin, and, still more emphatically, the nave of Bristol Cathedral, are works in which the original element is too large quite to justify us in calling them "restorations;" nevertheless no other more appropriate word occurs. Of new churches due entirely to Street's inventive genius the earliest which calls for notice is St. James the Less, Westminster. All Saints', Boyn Hill, Maidenhead, with the adjacent block of almshouses, soon followed; then All Saints', Clifton, noteworthy for its noble span. Then come St. Mary Magdalene, Paddington; St. Philip and St. James, Oxford; St. John's, Torquay; and, of a later date, Kingstone, Dorset; a series of churches in the East Riding of Yorkshire for Sir Tatton Sykes; St. Saviour's, Eastbourne; St. Margaret's, Liverpool; St. John the Divine, Kennington; the Garrison Chapel, Portsmouth; with the chapel at Dunecht; and his own particular church, St. Mary, Holmbury, near the beautiful retreat which he had built for himself. Abroad, Mr. Street constructed the Memorial Church at Constantinople; the American and the rising English churches at Rome; and he designed the American Church at Paris. Such are, perhaps, his most conspicuous churches; while there are two cathedrals which only exist on paper. The beautiful design which won the second prize at the international competition at Lille in 1856 is well known—better, probably, than the design for Edinburgh Cathedral, completed in 1872, which I have no hesitation in saying seemed to me of the highest merit; while, perhaps, its distinguishing qualities were those which caused it to be rejected—namely, its modesty and its scrupulous adherence to the stipulated price. Mr. Street, with much precision, grasped that smaller ideal of cathedral which is found in those parts of these islands which are not England, as at Kilkenny, Llandaff, and Dunblane, and reproduced it under conditions which left the building every inch a cathedral. However, a less original rendering, of the usual English type, was preferred.

#### The Guards' Chapel.

I must now note two works which do not quite fall under restorations or new churches. First comes an effort of great ability and courage—the recasting of the interior of the dreary Guards' Chapel, which stands up like a starveling Greek temple in Birdcage Walk. The problem was to transfigure the inside, while he was bound to leave the exterior in all its old hideousness. So there it now stands, all glorious within, full of thoughtful artistic beauty—a church admirably adapted for Anglican worship, displaying loving care in every detail. Gothic would have jarred too harshly with the inevitable outside, so Street worked in a style in which Romanesque, referring backward even to San Clemente, is handled with an originality and an avoidance of anachronism which makes it incontestably appropriate to its age, its country, and its peculiar use.

The other speciality of which I may speak is the storied reredos (containing Redfern's masterpieces of sculptured groups), which, together with Pugin's window, fills the east end of St. Andrew's Church, Wells Street.

#### Colleges, Houses, &c.

Of religious buildings not churches, his earliest was the Theological College, Cuddesdon,—very picturesque, but no doubt too crowded. Later, and of broader design, comes St. Margaret's Convent, East Grinstead; while of works purely secular, let me first name the design which won a prize more than a quarter of a century back in the competition for the Foreign and War Offices. Dunecht House, Aberdeenshire, is highly spoken of, and a Gothic house in Cadogan Square does noble battle with the envying phalanx of Queen Anne conceptions. I pass over various parsonages and schools. Mr. Street's own house on the flank of Holmbury, Surrey, shows a masterful handling of the homely picturesqueness of the Tudor phase of our old national style. In another competition, the limited one for the National Gallery, Mr. Street was not successful, and truth compels me, as one of the judges there, to say that I do not think his design was one of his happiest inspirations. But a far more important competition

was proceeding at the same time, the one for the Courts of Justice, and it is best to sum up this momentous chapter in the history of national architecture by saying that it has enriched this generation and this city with Street's great masterpiece in the Strand,—a masterpiece of which we may be well proud, in spite of the mutilations to which it was subjected by official ignorance and parsimony.

#### *Writings.*

I will not weary you with any longer list of those beautiful works sown broadcast over the land, in every place, so to speak, except, I grieve to say, Cambridge; but I turn to Street's literary work. I shall not attempt even to epitomise the long schedule of articles, papers, lectures, reports, and pamphlets which dropped from his pen, winding up with that noble legacy, his very last effort of active intellect, the presidential address at the Royal Institute of British Architects, of November 1881. Street has endowed architectural literature with two books. "Brick and Marble in Italy" first appeared in 1855, and made its author's name generally known. A second and enlarged edition appeared at a much later date. The second work is "Gothic Architecture in Spain," which taught the superficial traveller that he had but touched the fringe of Spanish Mediæval architecture by visiting Burgos, Toledo, and Seville, if he left Santiago, Gerona, and many other noble minsters unvisited. Spain in Street's hands was no longer a Renaissance country with Mediæval exceptions, but as truly Gothic a country as England, France, or Germany, and with closer affinities to them in style than Italy.

#### *Variations in Style.*

What are the lessons which we can draw for our benefit from this long record of prodigious brain activity? There are many, both artistic and moral, and there is one in particular which partakes of both natures, and which admits of concise statement, I mean the openness to conviction, the independence of mind, and the absence of false pride which led Mr. Street to change his style when he saw reasons to believe that he was marching along the wrong road. The pupil of Scott and the child of the Ecclesiological Society, he started in life with art principles of the more rigidly English orthodoxy. But he was actively and rapidly receptive, and his Italian tour wrought a great change in his views, and he returned full of the adaptability to home wants of many seductive features of Italian Gothic—cornices, plate tracery, brick and marble interchanged, and so forth. Of this influence St. James-the-Less, Westminster, is a notable instance, and signs of it are found in his offer for the Public Offices, in Cuddesdon College, and in Boyn Hill Church. Many architects followed in his wake, and the success of Italian Gothic seemed secured—not as an interesting and fruitful object of study, that it always must continue till taste and research are hissed off the stage—but as a style desirable to be used in England in conscious preference to the traditionary native forms. Though the building is not by Mr. Street, I may point to the Scientific Museum at Oxford as the climax of this phase of taste. Few as are by comparison the years which have gone since this building was hailed as an architectural revelation, they are nearly as remote as the days of Chambers and the Adam family—perhaps more so. By-and-by Street's candid mind and clear intellect realised that workaday Italian Gothic was for England a caprice, and he bravely returned to the purity and elasticity of the Edwardian style, only retaining, as he had a full right to do, the greater variety of materials in marble and brick and mosaic, which modern commerce and processes had made available, and which could be developed on the lines of English composition with as much truth as upon those of a foreign style.

For a man to change once is not so uncommon, and the action may either show wisdom or the reverse, or simply come of unconscious drifting. But for a man to retrace his course after such a change is either instability or heroism, and Street's practical retraction of that propagandism of Italian Gothic in which he had shown himself so personally successful partakes of the latter quality. Such changes might be comparatively easy with the architect who is personally above detail, or who, in other words, is too lazy or too busy to attend to the minutiae of his own buildings. Street was none of these. He felt profoundly that the whole was made up of its parts, that *ensemble* and detail helped each other; while bad, coarse detail might blur the merit of that which in the rough had been a powerful conception. So with cheerful, unremitting toil he laboured away, not merely at mouldings and foliage, and so forth, but at furniture, fittings, and all accessories, ornamental or practical, in all the various materials, which may be briefly summed up as sculpturing, handling of metals, enamelling, the use of crystals and gems, woodwork, textiles, painting on glass or walls, or tablets, or on other varied objects, like a true ecclesiologist as he was. There can, I fear, be little doubt that he shortened his life by the enormous toilsomeness which he imposed upon himself at the Law Courts in his determination to make them perfect at every point.

The question has sometimes been asked whether such subsidiary designing is a legitimate portion of the architect's profession. I can only wonder at the narrowness which seems to me to prompt the doubt. The architect surely is *poïetes*, and his

work a poem; and, as every poet who loves his work strives to make it as polished and perfect as he can in every stanza and every line, so ought the architect to act. Architect, we know, means chief workman, and to the chief workman must belong the direction of all the work. But perhaps the architect feels that some one else can more successfully handle these accessories than himself. If so, he is right to use that superior gift, but in so doing he so far admits his colleague to a partnership in the poem.

All through Mr. Street's career his fidelity to Gothic was so immaculate that I believe he only twice in any original design strayed even into Norman or Romanesque—in the private chapel for Lord Crawford at Dunecht, and in the Guards' Chapel, where the choice was inevitable. Never so much as with the tip of one finger did he ever touch the so-called Queen Anne style.

#### *Mr. Street as President of the Institute.*

Before I close I must speak of the latest, and in some respects not the least noble, episode of Mr. Street's life—that of his elevation to the dignity of President of the Royal Institute of British Architects, and his discharge of its exalted functions. The Institute is a commonwealth, and, like other commonwealths, it has its parties and its schools of opinion, both in matters administrative and upon artistic questions. Without such liberty of thinking there could be no life in the body. "Thou hast no tides, poor soulless sea," would be the contemptuous verdict passed upon it. Now no man enjoyed, as I have shown, the luxury of believing his own and disbelieving other people's opinions to a more robust extent than Street; and so it happened that his election to the chair of the Institute was not the unanimous tribute at the visible close of a long life to the venerable deserts of the old man eloquent of pencil as of voice, but the result of a healthy party fight to choose the leader who should, as vain man anticipated, arise, in all the power of a life mature and not declining, to hold aloft for many years the standard of his convictions. So Street won by a very narrow majority. But then came the marvel. The shadow, luminous and mysterious, seemed to have been projected. The old mind of the buoyant party man was there, but purged, enlightened, elevated. The impartial care for all that was for the good of architectural men, architectural art, architectural ministration to the welfare of society, as embodied in the Architectural Institute, was the President's duty and delight. Appreciative of all excellence, peacemaker in all perplexities, he succeeded during those few months of office in winning the influence, esteem, and affection of all; and in the sad day following quickly on his death, I heard general regrets at the irreparable loss fall from the lips of those who had certainly in past years not mounted his colours.

The CHAIRMAN asked whether any members would like to offer remarks. He had one observation to make, and it was that Mr. Street had been credited with the restoration of Carlisle Cathedral, whereas he (Mr. Christian) had restored it. Mr. Street's part consisted of a reredos and some works at the frater.

#### **The Works of the late W. Burges, A.R.A.**

BY GEORGE AITCHISON, A.R.A.

In 1853, when I was a student in Rome, I made the acquaintance of Captain Drummond at the English Academy. As soon as the season was over he used to give picnics to the English artists and residents who still remained in town. Some place of antiquarian interest was picked out at a riding distance from Rome, and most of the company went on horseback, but there were carriages for those who preferred driving to riding. On one eventful summer morning it was agreed that I should go to Gamgee's stables, with a friend who kept his horse there, and get a mount, but being rather late I found every horse but one gone; this horse had been ordered by a gentleman of unknown name for an hour before, but as he had not come for it, we persuaded Gamgee to let me have it. We joined the cavalcade at the Porta del Popolo, and a few hours' canter brought us to La Storta; while we were waiting for the guide the carriage arrived. A short man, with light curly hair and spectacles, was objurgating the man who took his horse. I was the culprit, and the objurgator was Burges. However, we settled the matter amicably, and as he preferred going back in a carriage, I had the painful pleasure of returning on the beast that brought me. We examined some of the ruined walls of ancient Veii, and entered the tomb of the Lucumo, whose skull and bronze helmet, pierced through and through with the bronze javelin head, still reposed upon a central slab; the tomb was cut in the rock, the central chamber being domed and adorned with rude wall-paintings, on which Burges descanted. We then discussed our luncheon, and rode home in the cool of the evening. Of that merry company, amongst whom were G. Mason, Poingdestre, Whitburn, Eagles, &c., how few remain!

#### *Burges in Italy.*

I saw but little of Burges in Rome, but I saw and admired his designs for the church ornaments to be used in Sir Frederick Leighton's "Procession of Cimabue's picture." At Sir Frederick's suggestion, Burges and I travelled together when we left Rome after the Holy Week in 1854, and took our farewell of Mount

Soracte. We travelled in *vettura*, the lumbering hackney coach drawn by two wretched hacks that with difficulty drag you twenty miles a day, but this mode of travelling gives you an ample opportunity of seeing the country you pass through, and the towns you stop at. We passed through Sta. Maria degli Angeli, and saw the church, rent by an earthquake, and the miserable inhabitants camped in temporary wooden barracks. At Assisi we made our first long stay; the hotel being full we stayed at a private house, at the modest cost of 1s. 7½d. per day, our landlady explaining that as we were English gentlemen accustomed to luxury she could not charge less. Poor Burges suffered there from a continued diet of pigeons stuffed with rosemary. After exploring the town, and getting a pair of 5-foot rods made by the carpenter, we made studies of the painted decorations of the churches of St. Francis. In our spare time we strolled the town, read Dante and Sacchetti, discussed art, and had our first experience of a slight earthquake. We then went to Perugia, and saw the Sala del Cambio and other buildings of importance, and then took the *diligence* to Florence, discussing the Roman defeat as we passed Lake Trasymene.

Our plan was to read Murray on the way, mark the objects of interest, on our arrival to go up the highest tower and see the town and its surroundings, and then to explore the town, visit the places we had marked, take notes, and measure such things as we thought would be useful.

Burges was then thoroughly versed in the Gothic architecture of England and France, and had come to Italy mainly to study architectural painting and mosaic, goldsmith's work, and secular buildings, as he despised the Gothic architecture of the Italian churches. After seeing Florence we went to Siena, measured the Palazzo Tolomei and other palaces, went to San Gimignano delle belle Torre, visited Boccaccio's house at Certaldo, went to Pisa, and, while Burges sketched in the Campo Santo, I measured an old brick palace there, the Café del Usso. We then went to Pistoja, measured the Palazzo della Comunità and the Paliotto, that splendid altar-front of gilt silver and enamel, made to replace the one stolen by Vanni Fucci and his friends. We then went back to Florence, measured the battlements of the Palazzo Vecchio, the staircase of the Bargello, and other parts of interest, and here Burges was laid up, and I measured the Palazzo Salviati, went to Prato, and to see some friends in the country, while he designed and executed a book-cover for Tennyson's poems. As soon as he was well we went back to Pisa, and saw the magnificent festival of St. Ranieri, which only takes place once in seven years, to commemorate his return from the Holy Land. The crossings of the streets through which the procession passed were carpeted with flowers in patterns, and at night the whole town was splendidly illuminated, so that when we left after midnight for Lucca, Pisa looked like a town of fire. We went from Lucca towards Modena, but where the countries join on the mountains, we were stopped, and found that we must either go back or hire a military escort, on account of the cholera in Tuscany; and though we thought this a curious sanitary precaution, we were half inclined to incur the cost, as we thought our parents would be flattered by our making a sort of royal entry into Modena guarded by a troop of horse soldiers; but economy prevailed over vanity, and we went to Leghorn and took ship for Marseilles, stayed at Lyons, thence to Beaune, where we measured the roof of the hospital. I let down the keys of this loft, tied on to a tape, through a hole in the floor, to see how high the roof was above the stone pavement; their jingling on the stones, and then ascending, was taken by one of the patients for a sign, and we had much bother to persuade the abbot to let us continue our measurements. As we were both in blouses, and black as sweeps, our appearance was not in our favour.

#### *In France.*

Thence we went to Dijon, where we measured the porch of Notre Dame, and the front of the Hôtel Chambellan. It was arranged between us that we should do no work on fête days, but always take a stroll in the country; but, in point of fact, I do not think we ever did; for, before we even reached the suburbs, Burges always espied a by-street that promised to contain some archaeological treasure. He had long been anxious to find an example of the red cloth put under pierced ironwork, and in one of the French towns we found a pierced knocker-plate in a back street. He explained the case to the occupier, a smith was found at a neighbouring wine-shop, and the knocker and its plate were taken off, and sure enough under the plate was found a piece of cloth, blackened for the most part, but with a bit of scarlet here and there, where wet and dust could not penetrate.

From Dijon we went to Troyes, and measured part of the cathedral, which was under repair. We then went to Ville Neuve L'Archevêque, and thence to Sens, where we saw the "Anthropophagi and men whose heads do grow beneath their shoulders" sculptured on the porch of the cathedral, and here we parted—I to go to Paris, and afterwards back to Italy, and Burges to Chalons-sur-Marne, and elsewhere.

#### *Biographical Details.*

During our travels I learned he was born on December 2, 1827, that his father was the well-known engineer of the firm of Walker & Burges, that he had matriculated at the University of

London, had attended some lectures on engineering at King's College, that in spite of his father's desires and the splendid prospect open to him if he became an engineer, he was so full of love for antiquarianism and Gothic architecture that he would be nothing but an architect; that he had been articled to Blore, had afterwards been with Sir Digby Wyatt, had sketched in England and elsewhere with Mr. Salter, measured Amiens spire with Mr. Warren, had travelled in France with Mr. H. Clutton, and helped him with the illustrations of his "Domestic Architecture of France," and that through the advice of Mr. Bruce Allen he had determined to measure everything important, and find out its whole method of construction. When I met him he was a rabid Mediævalist, and believed there was no salvation out of the thirteenth century. Sir Digby Wyatt had nicknamed him "Troy," because when it was suggested to Burges that he should make a view of Troy, he said that, in accordance with the custom of the Middle Ages, he should make all the architecture of the thirteenth century.

#### *Archæological Lore.*

He was so profound an archæologist that he used to jeer at Blore for declining to give his opinion on the age of a wall because there were no mouldings on it, saying he should have known by the size, working, and bonding of the stones, and the mortar joints, to what age it belonged.

You may easily imagine his scoffs at the Pagan architects of the Renaissance, and his hope that some day "he might make that old wretch, Sir Christopher Wren, turn in his grave." He did, however, allow there was one Pagan architect living that he respected—Professor Cockerell—though he added there is so little to learn in the style that the merit is small as compared with learning the Mediæval style.

I have always looked upon it as one of the privileges of my life to have had the chance of being constantly with this genius for so long a period. Unfortunately, biographical sketches of men of thought are necessarily dull; the flame of genius can only be seen in their works, and those workings in the alembic of the mind by which new products are distilled from the materials provided, are necessarily hidden from mortal eyes; the exact portraiture of the man cannot be given without offence during the lifetime of the persons to whom he was dear.

The minute, exact, and profound knowledge of Mediæval architecture, decoration, furniture, and letters that Burges had acquired was tempting him to produce a treatise on them for the use of students, when the publication of Viollet-le-Duc's "Dictionnaire" took the wind out of his sails—perhaps fortunately—for the publishing architect was turned into the practising one. But we are now speaking of him in the embryo state. He was then one of the most rapid and brilliant draughtsmen I ever met with, and had the most inexhaustible fund of invention; illustrations of literary incidents, designs for chalices, crosiers, knives, scent bottles, comic alphabets, caricatures, Mediæval towns or buildings, came forth from his pen, pencil, or brush, without a moment's reflection; and although his humour was shown rather by his drawings than by his words, he would on occasion give vent to epigrammatic sentences. "Academies are the death of art" may be instanced as one of them.

#### *Châteaux en Espagne.*

At this time his one besetting fear was lest he should be carried off by accident before he could show the world his genius and his knowledge; his one great hope that he might hereafter partly realise in a house of his own his views of artistic completeness, and no Arab ever had more gorgeous visions than Burges. This visionary house was to be of perfect Mediæval pattern, full of quaint carvings, and blazing with colour, hung with costly stuffs embroidered in gold, and lighted by silver lattices whose storeyed panes were of cut gems. He was to have jewelled chalices to drink from, and aloe and sandal wood to burn.

Even the castle building of so eccentric a man of genius seems to me to have its value, as giving us some insight into those powers he felt himself possessed of and that he most wished to exercise. Well, it was this: he would be first an architect and build a specimen of every ordinary human construction except a cathedral; he would amass enormous wealth, and spend some of it in realising his views in his own house; he would marry; he would, as soon as these varied works were done, become a member of Parliament, and correct some of the abuses of society; he would then go into the Church, become a bishop, and with his wealth build a perfect cathedral of the most costly materials, adorned with the most perfect specimens of all the subsidiary arts; and, when this was done, he would end his days as a monk or a hermit.

#### *Lille Competition.*

He returned to England, I believe, at the end of 1854, and I in the spring of 1855; he had then designed a claret-jug and a jewel-coffer for a client, and in the same year he entered into competition with Mr. H. Clutton for Lille Cathedral. In March 1856 I went with him to Lille, and saw the competition drawings, and we afterwards went to Tournay. It is said Viollet-le-Duc at first believed that Clutton and Burges's set were some old drawings of the thirteenth century, until he saw "Whatman" on the paper.

For once, Burges met his match at repartee, which was no small thing, for when angered he was like the bee, *ponit animam in punctu*. He was fond of talking to workmen, and was always anxious to know of them how long they thought it would take him, the accomplished architect, to learn their trade. On this occasion he went into the kitchen of our hotel at Lille and saw the cook, a little hunchback. And after Burges had explained who he was, and that he expected to have the cathedral to build, he asked how long the cook thought it would take to learn cooking thoroughly. "Ah, sir! in a fine art like mine one is never master of it; one is always learning."

#### English Work.

In 1857 he restored some of the images and designed others for Salisbury Chapter-house, and restored the building in conjunction with Mr. H. Clutton. He gained the first prize for the Memorial Church at Constantinople in 1859; he designed the cathedral for Brisbane, restored Waltham Abbey, and in 1862 gained Cork Cathedral in competition, altered Gayhurst House for Lord Carington, and delivered the Cantor Lectures at the Society of Arts; in 1864 he decorated Worcester College Chapel, Oxford; in 1865 he began the restoration of Cardiff Castle, and built a house for Mr. McConnochie at Cardiff; in 1866 he designed the School of Art at Bombay; in 1867 he competed for the Law Courts, and published a book of his designs for them. In 1869 he built Knightshayes for Sir J. H. Amory, Bart.; and in 1870 he built the church at Studley for Lord Ripon, and that at Skelton for Lady Mary Vyner, and published his book of architectural drawings, containing many of the examples we measured together. In 1872 he began his series of drawings and models for the decoration of St. Paul's Cathedral, London. In 1873 he competed for the cathedral at Edinburgh, and made the drawings for Hertford College, U.S.; built Templebrady Church, Ireland, and the Speech-room at Harrow. In 1876 he began to build his house in Melbury Road, the internal decorations of which were not completed at his death. His last work was the additions to the Maison Dieu at Dover, to convert it into a Town Hall, since completed by Mr. Pullan.

On January 28, 1881, he was elected an Associate of the Royal Academy, and he died on the 20th of April of the same year. Rarely has any architect been followed to his grave by so many mourning friends, mainly architects from all parts of the country.

A book of his designs was published last year by Mr. Pullan, his brother-in-law.

#### The Gothic Revival and Burges.

It seems to me that there are now only three points for our consideration—the effect of his works and teaching on public opinion, on the younger men of the profession, and the merits and peculiarities of his works. Horace Walpole, in the middle of the last century, advocated the return to Gothic architecture as a patriotic and antiquarian revival, and made rude attempts to apply Gothic ornament and surface decoration to buildings. His notion spread, but it was not till nearly the second quarter of the present century that this antiquarian revival was passionately advocated; and this outcome of late Roman Catholicism was called "Christian," while its supporters poured out floods of obloquy on those who admired or practised any other style.

Augustus Welby Pugin began the onslaught with his "Apology for Christian Architecture," and the public, who are always interested in a literary conflict, especially if the *odium theologicum* can be imported into it, were easily converted to Gothic, as all forms of beauty were equally indifferent to them, and the advocacy of Gothic supplied them with staple for discussion and abuse. The battle was kept alive by such generals as Sir Gilbert Scott, Street, and Burges, and such was the enthusiasm of the first and last for Gothic that nothing but great temptation would make them abandon it. Burges, who was the youngest, ablest, and most learned of the three, naturally produced a powerful effect on the public, though by some ill-luck he never got his fair share of the large works carried on. The effect he produced was not a little assisted by his quaintness and pungency of expression; yet in spite of all this passionate advocacy, other influences were at work which silently but surely sapped the foundations of this new Jericho, whose walls at last fell without even the sound of a trumpet. It was generally felt that dignity and simplicity were more allied to our present civilisation and turn of thought than Gothic perplexity. For constructive purposes the introduction of iron had superseded the methods used in the Middle Ages, and the advancing arts of painting and sculpture found themselves too incongruously surrounded in Gothic buildings to be used with effect, even when their highest forms were not resolutely excluded by the architects themselves. The simplicity and matured elegance of form in the higher works of painting and sculpture supplied an inconvenient standard of judgment in Gothic buildings. These considerations had, however, but little effect on the young and ardent enthusiasts of Gothic, steeped to the lips in the diatribes of Pugin and Ruskin. Burges's pupils and young admirers drank in with undoubting faith the precepts of one who was so enthusiastic, so certain, so skilful, and so learned, and they were quite prepared to accept the architecture of the thirteenth century as the ultimate standard of perfection, for were they not

always hearing the master say, in criticising any new work, "I ask myself what a thirteenth-century architect would have done in this case?"

#### His Style.

I never saw any of Burges's designs for buildings that were made before he went to Italy, and while he was there he did not fail to appreciate the grandeur and massiveness of its palaces; and, as he absorbed the good from all the Gothic examples he saw, his work for ever after bore traces of that influence. In the same way he was impressed with some Arab forms, which he afterwards rarely relinquished. Another marked peculiarity was his fondness for circular forms, and it was rare indeed to find any considerable building in which this fondness was not shown. Nearly all his designs for cathedrals show his preference for the circular end over the square. The Law Courts and his own house show in a marked way this tendency.

His works, or at least those in which his judgment was unfettered, exhibit his predilection for vigorous simplicity; better examples cannot be given than Mr. McConnochie's house, at Cardiff, and the Harrow Speech-room. If the Law Courts were to be Gothic we must all regret that he was not entrusted with them, as, in his design, the Strand front was a grand composition, and the proportion of the parts noble. Even Sir G. Scott, a rival competitor, speaks of it thus:—"While Mr. Burges, though his architecture exceeded in merit that of any other competitor, was, nevertheless, eccentric and wild in his treatment of it." How the Government could have passed him over when they had such a genius to their hand is difficult to understand, and the plea that his plan was bad is well disposed of by Sir Gilbert:—"An able and artistic architect can surely make a good plan, while no amount of skill in mere planning can by itself enable a man to produce a noble building"—a truth that those who have the disposal of our new public buildings should take to heart.

Burges's skill, however, was by no means confined to pure architecture; his inexhaustible invention was shown in his church ornaments, in the accessories to houses, and in the quaint designs for figures and figure-subjects with which all his works were over-spread. Perhaps the stained-glass windows of his own hall afford one of the best illustrations of his skill and inventiveness in this direction. The subjects are the spirits of Sound floating out of the ringing bells. His devotion to one phase of art may be well recommended to the student; his desire to master all the cognate arts may be pressed on the attention of those whose genius will enable them to imitate him, and we have but two regrets to add—one, that a man possessed of so strong a personality did not leave an autobiography; and the other, that we have not more of his executed works.

#### Viollet-le-Duc as Architect and Art Historian.

BY MR. WETHERED.

Busily engaged in another profession, and long enough in sympathy with your pursuits to be sensible of my many shortcomings, it is only by the courtesy of the Council of this Institute that I am now permitted to direct your attention for a short while to some aspects of the life-work of the gifted man whose name will be associated for ever with the architectural glories of France. I must ask an assemblage like this to accept in a spirit of kindly criticism the scattered observations of an outsider who happens to have seen a good deal of the executed work of the master whom to know was to regard with feelings of veneration and affection. To this word of self-introduction I may add that I hope my present paper will be supplemented before long by another, entitled "A Fortnight with Viollet-le-Duc in Switzerland," which will comprise a sketch of his striking personality and a further glance at his manifold powers.

Eugène Emanuel Viollet-le-Duc was endowed with widely-contrasted gifts, only bestowed together in fullest measure on minds of the first order. He was at once an intense realist and an idealist. He possessed the scientific bent for getting at the core of the facts of nature, and he had also the expressional and shaping faculty which can reveal emotional truths through the language of art. The works of a deceased master are an abiding presence, and in them we speak of him as historically living. In thus approaching Viollet-le-Duc in his twofold capacity of architect and historian of art, I can do no more now than take a swift run across the *vrai domaine royal* claimed for him by Sainte-Beuve, over which he equally holds sway as master of "the compass, the pencil, the chisel, and the pen."

Turning first to two or three of his written and illustrated works which come well within the scope of this Conference, I will then pass on to speak briefly of the artist who creates of himself, and who also brings the buried forms of the past back to life.

Art with him was a strong instinct from his very cradle, and his family surroundings were well fitted to nurture the growth of a child of genius. His father was a man of mark in literature, and his uncle, M. Délacluze, an artist of distinction. Every week at the house of one or the other he met some of the most gifted intellects of France. At these *réunions* he made in his earlier years the life-long friendship of Thiers, Rémusat, Mérimée, Ampère, Villemain, Stendhall, and others known to fame. Always on the

alert, we may be sure the receptive mind of young Eugène assimilated innumerable ideas from listening to the best literary and philosophical talk of the day. His education had breadth and thoroughness by no means common fifty years ago. It was completed by more than one lengthened stay in Italy, and supplemented by a course of dissection at one of the medical schools of Paris, in order to obtain a practical knowledge of anatomy in relation to external form. Always self-reliant, by the time he was eighteen he had made more than enough pocket money by his water-colour drawings and modellings to buy himself a horse, and with this helpful companion the young enthusiast in art made the first of a series of journeys which enabled him to visit, measure, draw, and describe the chief ecclesiastical, military, and civil buildings of the Middle Ages over the greater part of France.

#### *Viollet-le-Duc as a Writer.*

Here the boy was father to the man, and the immense mass of materials thus collected in his youth laid the foundation of his *opus magnum* so well known to you, the "Dictionnaire Raisonné de l'Architecture Française," followed by its complement, the "Dictionnaire du Mobilier Français," forming together sixteen volumes, illustrated by nearly 6,000 engravings, finely drawn on the wood by himself. For the archaeologist and student of history these volumes unlock the vast treasure-house of the Mediæval world. Given a building of ancient France, to take an instance of the thoroughness of his insight and teaching, he is not content with settling the date, and describing the external characteristics that determine the style or school; but, if I may apply surgical terms, he submits it to careful dissection, and repays us with the knowledge of its anatomy and physiology, the structure of the whole, and the functions of its various members. Unfolding its origin he presents it as a product of evolution; as a more or less perfect type of a phase of development; and as the logical expression of the needs, customs, aptitudes, and aspirations of a people.

Mr. Street has gracefully acknowledged his leadership in these researches in his "Gothic Architecture in Spain":—"M. Viollet-le-Duc's articles in the 'Dictionnaire Raisonné,'" he states, "on the planning of French churches, are extremely valuable, as indeed is all that he writes; and I take the opportunity afforded me by the aid which he has thus given me to express the gratitude which, I suppose, every student of Christian art feels for what he has done towards promoting its right study." Not a few of the articles are complete essays: that on mural painting, according to M. Véron, editor of *L'Art*, is a veritable treatise on chromatic harmony by a man thoroughly master of the subject. It contains a multitude of facts as interesting as they are little known. Mérimée, in a learned review, extolled alike the prodigious fecundity of the writer and the force and finish of the draughtsman.

His "Lectures on Architecture," so ably translated by Mr. Bucknall, twenty in number, are a *résumé* of his doctrines generally. This critical interpretation of man's graven dialect in the monuments of the past is a philosophy of architecture, and within its compass a philosophy of history itself. To myself, a simple searcher after the beautiful, with vague notions of art, it came as the revelation of æsthetic truth. I believe it to be the book of all books for obtaining a wide outlook over the world of man's handiwork—over that combination of the arts which gives architecture vitality and voice. This treasury of facts and ideas, of axioms and apophthegms, is an authoritative code of arts, of laws bearing on their kinship and interdependence, upon what they are in themselves and in relation to each other. The depth and range of his acquirements are not less conspicuous than is his aversion to dogmatism and exclusiveness. Bringing the analytical method to bear upon his investigations, he verifies his conclusions by synthesis. He resolves the work under review into its essential elements, tracing the latter back to native instincts and gifts. He shows how these elements are severally combined by the Greek, the Roman, and Mediæval builders, and how, by bringing principles into harmony with form, they have left us diversified types of the everlastingly true and beautiful. To the neglect of these fundamental principles he ascribes those hybrid productions of modern times, Neo-Greek, Neo-Roman, Neo-Gothic, which defy classification—"A medley of styles, fashions, epochs, and means of construction."

#### *MM. Morel's Volume of Reproductions.*

At an influential meeting in Paris, held after the close of the exhibition of his works at the Musée de Cluny, it was resolved to reproduce by the best technical methods a selection from his drawings, representative of his range and manner generally, including many examples of detail in relief, section, or profile, as they flowed from his hand for execution by his school of artists and craftsmen. A sum of several thousand pounds was at once subscribed, and a committee formed for carrying out the project in a way worthy of *le grand patriote et le grand artiste*. The resulting portfolio of *compositions et dessins* just given to the world is at once a monument of his creative versatility, and the fittest memorial of an architect ever raised by his *confrères* and friends. In these facsimiles the accent of the master is never missing, in his unerring firmness of touch and fine sense of form, in the calm dignity of his statuary, and in the life and vigour of his

ornamentation generally. In his constructive and decorative designs we discern unity amidst plurality, combinations of the grand and the simple that result in a style of distinction with lucidity, so that he who runs may read the *raison d'être* of every detail.

#### *Designs for Art Workmanship.*

Whatever the scale or subject may be, whether designing a reliquary to be worked by goldsmith or silversmith, or planning a vast cathedral front, with its eloquent chapter of sculptured harmonies, like that of Clermont-Ferrand, we everywhere perceive the impress of a master-hand.

His figure-subjects and carved work generally,

Cornice or frieze with bossy sculptures graven,

as well as his wall-paintings, are essentially monumental and decorative in the true sense—*en rapport* with their surroundings, from which they cannot be detached, even in drawings, without our losing something of their full effect.

Who has not loitered to observe his happy and often grotesque renderings of animated nature in beasts of the field and fowls of the air that catch the eye of the passer-by from every coign of vantage outside the cathedrals of Rheims and Paris, not to mention endless other examples of his humour in this vein to be met with here and there throughout France? Whether wrought in stone, wood, or iron, they exhibit a singular mastery of animal configuration and gesture, with a facile fertility of production that never repeats itself. Thousands of these, replacing originals long lost, are re-creations rather than reproductions. Very notable, too, are his adaptations of the plant growth, displayed in a very world of bud, leaf, flower, and fruit, with a subtlety of curved line and dash of manner that always charm the spectator. "Joy's soul lies in the doing" of such work.

The revival of the higher art of the coppersmith and leadbeater in connection with architecture is largely due to his plastic handling and teaching. As surpassing examples of the handiwork of the former, I may instance the statues grouped around the *flèche* of Notre Dame, and the figure of St. Michael crowning the chapel of Pierrefonds Castle; of the latter, the crestings, crockets, finials, &c., on the adjoining roofs. To this phase of his genius we owe his achievements in a sphere and period which Mr. Hamerton, in his interesting "History of Autun Cathedral," has named "the epoch of Viollet-le-Duc"—the sphere of architectural restoration.

#### *As a Restorer.*

Restoration is an impulse of our day to conserve the good bequeathed to us in every architecture, and to undo the misdoings that have degraded or obscured earlier and better work, paying due regard to later additions of exceptional worth. It is to give a building, whose constitution has suffered from age or injury a renewal of life, by treatment adapted to its peculiar temperament. Viollet-le-Duc's grasp on the past, the logical bent of his mind in the observance of principles, his wealth of ideas and ability to give them shape, have made him *facile princeps* of Continental restorers. His ideal restoration of the Baths of Caracalla is as vivid as that of the Château de Coucy on paper, or of Pierrefonds, in fact. A lover of unity amidst infinite variety, the marvels of the Middle Ages were to him well-ordered organic wholes—the embodied ideals of their framers or of successors inheriting their instincts—and not as they have too often become at the hands of latter-day meddlers, a *mélange*. Order, Heaven's first law, was theirs and his. They solved their problems in stone by mathematics, and enriched their constructions with shapes and suggestions gathered from living nature in field and forest around.

#### *His Buildings.*

Having given, however imperfectly, some notion of Viollet-le-Duc's spirit and method, but short space is left for me to ask you to accompany me in thought to a few of the more famous buildings upon which he has lastingly set the sign manual of his art. Monsieur Baudot, an accomplished disciple of his master, and now Inspector-General of Historical Monuments, has, through a friend, honoured me with a note in point well deserving, I think, of being read to you. He writes:—

"Viollet-le-Duc began in 1869 the interesting work of completing the cathedral of Clermont, *i.e.*, two bays of the nave similar to those already existing, also the two towers, and the principal façade. For the façade and these towers he had no other data to work upon except substructions, the cathedral having never been finished at this point. There were, in fact, only foundations, and he had to conceive a design, that is to say, to create the work in question. Availing himself of the experience of the Mediæval masters, without tentative effort he created at a stroke that grand composition—façade and towers; and I do not think there exist in the Mediæval period towers or spires of finer outline, or more skilfully planned in point of construction. It will be understood that this work, like the rest of the cathedral, is executed in the style of the close of the thirteenth century. Nevertheless, in the ornamentation and in the outlines we find a character of simplicity which belongs especially to Viollet-le-Duc, who did not copy; but interpreted the Middle Ages by drawing his inspiration from

nature as regards the flora, fauna, and statuary. In the execution itself Viollet-le-Duc conducted only a part, and when he relinquished his post as diocesan architect in 1874, the work was carried up only as far as the top of the nave. At this time I was commissioned to complete it, and consequently to supply part of the details of execution, but I did my best to interpret as completely as possible the master-thought which had designed the whole, and had supplied details of every kind for the greater part of the work, the honour of which belongs entirely to him."

The church of the Benedictine Abbey of Vézelay is the most imposing remnant left of that great school of Cluny which had so marked an influence in Burgundy, and, as we learn from Viollet-le-Duc, over Christendom at large. In 1839 it presented, from long and general neglect, an aspect so forlorn and threatening that it became a question with the authorities whether its fate should not be settled by a *coup de grâce*. The loosened masonry of its Romanesque vaulting, that for six hundred years and more had spanned the nave with a grandeur hardly to be seen elsewhere, rested on toppling walls ready to fall at the first stroke of the hammer. Mérimée, then Inspector-General of Historical Monuments, was one of the first to recognise the practical genius of Viollet-le-Duc, at that time an untried architect of five-and-twenty, and to him he entrusted the important task of its preservation. It was the starting point of his career as a conservator of things of the past. He was wont to speak of it as his *premier amour*. The fruit of that first love is a finished edifice as strong as when built by Clunisian masons in the twelfth century. Left to the tender mercies of those doers of nothing, who are opposed to all restoration, this ancestral monument, seen again to-day in all its perfected strength and severe beauty, would have become ere this a huddled mass of ruins, *rerum confusa sine ordine moles*.

Shortly before his labours at Vézelay he was engaged, under Lassus, in resetting that architectural gem of purest ray serene, the Sainte-Chapelle of St. Louis.

"Many-towered" Carcassonne is an ancient and mighty stronghold of Languedoc, which every tourist in the Pyrenees who loves the past should step out of his way to see. It is in all ways the most perfect example remaining of the systems of military defence that prevailed in Europe from the eleventh to the fourteenth century. Within the citadel may be seen the various implements of war used through the ages swayed by the baron and the monk, which have been restored or constructed by Viollet-le-Duc, whose genius as a military engineer has been fully recognised by authorities on both sides of the Channel. With its restored belongings, it is much in the same state as when, "in 1356, this fortress effectually resisted the Black Prince, who burned the suburb below and ravaged with fire and sword the whole of Languedoc."

The Romanesque church of St. Nazaire, with the ramparts, is well called by Murray a perfect gem of architecture, and unlike anything in France. Less than thirty years ago it was all but a pile of ruins. The vaulting had fallen in; the walls were cleft and rent; the stained glass, in brilliancy and glow of colour equalling that of Chartres, was broken and detached. Here again his reshaping hand has

Softened down the hoar austerity  
Of rugged desolation, and fill'd up,  
As 't were anew, the gaps of centuries.

The Château de Pierrefonds, with its encircling towers, donjon-keep, and chapel dismantled and in great part destroyed at the beginning of the seventeenth century, has risen again with not less outward strength and inward splendour than when it dominated the Forest of Compiègne in feudal times. This baronial palace and fortress in its renovated state is a series of deductions in stone by the Cuvier of architects, who re-clothes the disarrayed structures of bygone ages with the vesture of his art. Sections of mouldings and other fragments rescued from the carefully-sifted débris are here and there replaced *in situ*, and give the key, as it were, to neighbouring details. In this restored page of the historical arts of France we find a pervading unity—a concord that comes of the sense of fitness where all things are in keeping—an *ensemble* which earlier schools possessed, but which in the chaos of our modern means and materials we have to a great extent lost.

It would seem that when a building has gone to the bad some of our notabilities in the republic of art would leave it as a dwelling for rats and carrion birds. From its relevancy to this part of my subject, I will presume to call their attention for a moment to what Frederick Schlegel says of the Abbey Church of St. Denis, when he beheld it in 1804 as wrecked by the Revolutionists:—

"The deep silent melancholy it inspires becomes stronger and more profound in approaching this ancient and now ruined cathedral. Every part that could be destroyed without too much labour and difficulty has been thrown down; the naked walls alone are left standing with the massy pillars and the arches that rest upon them. As the doors were opened a host of jackdaws and rooks, the sole inhabitants of the desecrated sanctuary, took flight, and when the dust they raised had subsided, we saw the upturned graves of the sovereigns of France, each of which the verger carefully pointed out."

To the critic whose own mood of mind is the measure of excellence in art, St. Denis may be a "whited sepulchre"; but posterity will have cause to thank Viollet-le-Duc and his band of skilled artificers for the renewed completeness throughout of that noble fabric, for the restored tombs and effigies of a long line of kings, not so very long ago lying mutilated and scattered over France. "Look on this picture, and on this"—contrast St. Denis as ravaged by the iconoclast, with the Church of the Patron Saint as we see it to-day, and who but lovers of decay and *débris* will doubt the lasting good done by men working in the spirit, and following the methods of the old builders?

The learned German critic also describes the condition of Notre Dame at the same date, as follows:—"During the first Revolution the front was injured in various ways, the exterior being despoiled of its decorations, and the statues torn down and destroyed. Worse than all this is the injury which the interior has sustained by absolute mutilation. The clustered pillars supporting the roof have been filled in, rounded and modernised as much as possible, so as to give them the appearance of solid circular columns. The effect thus produced is completely inconsistent with the plan of the exterior. . . . An intolerable spirit of persecution in the arts was often seen united with that inclination to imitate the false antique, which seemed epidemic in the eighteenth century."

Certainly man's rage outside, and the flaunting spirit of the Renaissance within, had done much to damage the aspect of the Church of Our Lady at Paris. The removal of the worst of the incongruities of later times, the pomps of Louis Quatorze and the vanities of Louis Quinze; and the added embellishments of Viollet-le-Duc, have brought about the harmonious change most of you have seen.

His works there culminate in that embodied conception of a tradition and aspiration, the new central spire or *flèche*, a masterpiece of scientific framing in oak within, and an artistic thing of beauty pointing heavenwards without. At its base stands the statue of the great architect, not "in his habit as he lived," like the one just erected on the front of the Hôtel de Ville, but in the fitting costume of a Mediæval master-mason. It is of hammered copper, wrought by his metal-workers, and placed there as an enduring mark of their homage and profound respect. The art of the modeller and the science of the geometrician, are also blended with happiest effect in the new baptismal font of bronze. So fine and bold are the figured reliefs of saint and symbol in this superb casting, that it is only by examination of the working drawings we notice how the freedom of the one in sweep and emphasis of modulated line is regulated by the applied laws of the other. Here, as in his works elsewhere, the artist and the man of science stand side by side. This duality is the note of his individualism, and the mental groundwork of his strength in the realm of imagination and in the world of fact.

And now, as the passing minutes warn me I have claimed more than my share of your kind attention, I will add my concluding word. None know better than yourselves, gentlemen, that a new architecture is the product of the combined effort of at least several generations; never the creation of one man. Viollet-le-Duc was not the maker of a new style; he did not attempt the impossible; but he has laid down with all the weight of his logic lines of direction for the path of the future. We must proceed, he insists, not by imitation of forms, but by deduction of principles, aided in their application by all the lights modern science can bestow, if we are to possess a constructive art worthily expressive of our age and civilisation. M. Baudot maintains, with the ardour of a follower, that this programme can be best fulfilled by a serious study of the "thinker and worker," whom he designates, "le chef de l'École de l'avenir."

The scientific or other specialist may here and there find something open to objection, but, taking the illustrious Frenchman all round, as a theoretical and practical architect; as an art-historian bringing the light of the past to illuminate the present; as a matchless teacher, in the workshop and in the studio, of arts which are the sisters, and crafts which are the handmaids, of architecture, he stands foremost as "l'homme du siècle"—the man of the nineteenth century.

#### Discussion.

Mr. AITCHISON said that no one in the room could feel more than himself, unless it were the gentleman who had just spoken, the excellence of this great Frenchman. All must have felt M. Viollet-le-Duc to have been one of those extraordinary men who appear at rare intervals in the world. From the time of Vitruvius no man had written a treatise on architecture which had thrown so much light on the history of architecture, combined with so profound a knowledge of art and constructive architecture as M. Viollet-le-Duc. The whole work, whether considered historically or as expositive of those arts which have passed away, must impress us as a combination of all the three things which go to form architecture. He had pointed out to them how the Mediævalist executed his work, and how this wonderful style grew up from debased Roman, gradually came to a point of excellence, and then suddenly expired. He had thrown a light on ancient work and that of the old Romans, and Monsieur de Choisy, his pupil, had written, from the inspiration of the master, one of the

most profound works of interest ever written, and which had taught them methods of construction they were before almost entirely ignorant of.

M. LEUCHARS then addressed the meeting, speaking in his native language, although well acquainted with the English tongue. He observed that he should carry away with him a pleasing remembrance of his journey to London. He was, as a Frenchman, profoundly touched at seeing the Royal Institute of British Architects in that special session paying the most solemn honours to the memory of a Frenchman, whose skill as an architect had been subject of dispute here and in France. He must, however, be a master who provokes dispute. M. Leuchars concluded his remarks by thanking the Institute for the high honour they had paid to one who was not their countryman. He begged to thank them as an architect, a devoted architect, and above all, as a Frenchman.

Professor KERR said it seemed to him that the papers taken as a group had lifted up their minds more than anything he had ever heard in that room. Differences of opinion sank into nothingness before such eulogiums as had been delivered in each case by the eloquent speakers and writers who had taken for subjects their very distinguished friends, and their equally, he did not say more than equally, distinguished colleague, M. Viollet-le-Duc. When at work at the table or in the office they felt themselves humble men of business, with many difficulties to contend with and humiliations to assail them; but when they came to the meeting-room and heard such addresses, they shut out all the vulgar world of business and rose to an empire of high art, which, laugh at it as Philistines might, was one to which they could ascend and shut out the world of business. He had listened to the eloquent periods of Mr. Hope, and to their friend Mr. Aitchison, so humorous and so amiable in every way. While Mr. Hope exalted the character of their friend Mr. Street, Mr. Aitchison engaged them with their fascinating and felicitous friend Mr. Burges; and Mr. Wethered, an enthusiast, seemed to lead them above all into the very highest ground of art. It seemed almost profanation to criticise the papers except as in the way he had humbly done—rather let them say they were above criticism. Let them learn a lesson from that night, and, regardless of Philistinism, do themselves justice in their own great work.

Professor KERR called attention to the presence of the Lord Provost of Aberdeen, architect.

The LORD PROVOST said he should enjoy being a regular attendant at the Institute. He looked back with pleasure to some five years spent in London in his early youth. He was really proud of the two offices in which he spent that time. He looked back with pride on Professor Donaldson and his kindness to him when he came to London as a mere clerk, without ability or interest, and who had taken him in and kept him in his office till he found work. He had seen him once or twice since, and the Professor had visited him in Scotland, not forgetting the poor clerk he had befriended. In the second office he sat next Street, in Sir G. Scott's office. He believed he had been selected for the great office he held in his northern city for carrying out the Improvement Bill they had obtained. He was doing his best to carry it out, and he hoped during his three years of office to do something in Aberdeen that would leave its mark behind it.

Mr. R. PHENE SPIERS proposed a vote of thanks to the authors of the papers, and this was seconded by Mr. J. P. SEDDON.

The CHAIRMAN said it had been one of the most charming evenings they had had for years, three of the most vigorous and powerful workmen of the century having been the subjects of the evening. The vote of thanks was then carried by acclamation.

Professor KERR proposed the adoption of a resolution conveying the congratulations of the Institute to Professor Donaldson, on occasion of the fiftieth anniversary of the Society.

The CHAIRMAN said they all knew what a kindly and friendly man Professor Donaldson had been to all who ever came in contact with him. Forty years ago he went to Professor Donaldson and asked him for introductions to Italy and Germany, and received letters from him, which were most useful to him, and one to Bianchi, the architect of the King of Naples. Mr. Horace Jones and Mr. Hayter Lewis were introduced to him by Bianchi, and they became fellow-travellers for some time. The resolution was unanimously adopted, and the proceedings for the evening terminated.

#### THURSDAY, MAY 8.

Thursday was devoted mainly to visiting buildings. The first was the new Oratory at Brompton, which was designed by Mr. Gribble, and the merits of the building were recognised by all. The second was the new Technical College, which will be better seen hereafter, when it is appropriated to its uses. Stafford House was considered to be more remarkable for the pictures than for its style or details. The third building was the fine house belonging to Mr. Hodgson, the banker, in South Audley Street. It was originally designed by the late F. P. Cockerell, and completed by Mr. Aitchison, A.R.A. Externally it is remarkable for the terracotta frieze by Mr. Boehm, R.A., which is carried across the front. The interior is finished with exquisite taste. The

details of the plaster-work and woodwork are equal to the best of what is done in Paris. Sir Frederick Leighton's frieze, *The Dance*, was painted for the drawing-room. The house contains some of the most costly objects that were in the Hamilton Palace sale, and the whole of the furniture is beautiful. In the dining-room is a valuable collection of engravings and etchings. The visit to this house gave most pleasure, although there was much which was attractive in Sir Wilfrid Lawson's and Lord Leconfield's. At the latter there is a splendid chimney-piece and overmantel, designed by Mr. Aitchison, which might be called a symphony in black and white, and a most effective frieze by Mr. Britten, which is composed of cupids gambling at the sea shore. In the evening there was a conversazione at South Kensington.

#### SCHOOL BUILDINGS.

**South Shields.**—The works in connection with the erection of a public day school for boys are to be at once proceeded with from the designs and under the superintendence of Messrs. Oliver & Leeson, architects, of Newcastle. The contract has been let to Messrs. Hirst & Sons, of Sunderland. The plans show accommodation for about 250 boys. The teaching will be entirely conducted in class-rooms with movable glass divisions, and there will be special rooms for chemical classes and other purposes. Children who may come from a distance will have facilities afforded them of dining on the premises. Accommodation is also provided for a resident caretaker.

**Henley-in-Arden.**—The Wootton Wawen School Board have just completed new schools at this place, which contains the greater portion of the population of their district. In the course of his speech at the opening of the schools, the chairman of the Board made the following remarks: "The school buildings, including the walling and draining of playgrounds, have cost the sum of 2,023*l.*, the number of school places provided being 283; the cost therefore per head amounts to 7*l.* 3*s.*; thus, whether we consider the above figures in comparison with the cost of other schools which have been built in the vicinity (Stratford-on-Avon for instance, which, exclusive of the site and other expenses, cost 10*l.* 10*s.* per head), or with regard to the average cost of Board Schools throughout the country, I think the Board may be congratulated on providing schools of such an admirable character at so moderate a cost." The buildings are chiefly of red brick, the roofs being covered with Broseley tiles; the floors throughout are laid with oak blocks, cut from the old timbers of buildings formerly on the site; the roofs are also partly of oak from the same source. The schools are from designs by Mr. W. Hawley Lloyd, of 79 Colmore Row, Birmingham, and are very carefully planned with reference to the aspect and peculiarities of the site; the buildings consist of a principal school room for boys and girls which is 51 feet by 20, and 16 feet 6 inches high. This is placed parallel with the main road; at its southern end are two class-rooms 18 feet by 17 feet, capable of being thrown into one, and also the boys' porch and lavatories, &c. At the northern end is a single class-room and the girls' and infants' porch, cloak room, &c., and an entrance for the public when the room is used for meetings. Behind the main block, and at the northern end is the infants' school, 36 feet by 20, and 18 feet high, and with a bay 17 feet by 6 feet, in which is the larger gallery. There are no corridors, but the entrance porches are so arranged that the boys, girls, and infants can pass from either room direct to their respective playgrounds or to the road. The rooms are admirably lighted and ventilated throughout, and are warmed by means of Mr. D. O. Boyd's ventilating school grates. Mr. F. J. Briley, of Coventry Road, Birmingham, is the contractor.

#### GENERAL.

**The New Archæological Museum**, at Cambridge, was opened on Monday. It was erected from designs by Mr. Basil Champneys.

**Mr. W. Flinders Petrie** has identified the site of the Necropolis of San in Egypt, with a chapel or shrine of Ptolemaic date.

**An Architects' Association** is proposed to be formed in Dundee. A provisional committee has been appointed, consisting of Messrs. Aitken, Blackadder, Ireland, Mackison, J. M'Laren, Keith, Ower, and T. M. Robertson, Mr. J. M'Laren, convener, and Mr. C. Ower, hon. secretary. The same committee have also to report on the rules and regulations for management of works proposed by the building trades of Dundee and vicinity.

**Messrs. C. Isler & Co.** are now fixing an 8-inch Artesian Bored Tube Well at Messrs. Brooks, Shoobridge & Co.'s Cement Works, Grays.

**Messrs. Charles Williams & Co.** were the sub-contractors for the whole of the constructional ironwork in Mr. Whiteley's premises in Queen's Road, Bayswater, with the exception of the warehouse next the baths.

**Messrs. Debenham, Tewson & Co.** have sold a building site at the south-west corner of Eastcheap and St. Mary-at-Hill, containing 1,755 square feet, on a building lease, at 1,220*l.* a year rent, or about 14*s.* per square foot.

# The Architect.

## THE ATTITUDE OF THE ASSOCIATES OF THE INSTITUTE OF ARCHITECTS.

NOT a few amongst the profession throughout the country—to say nothing of the senior members of the Institute especially—must have experienced a feeling of some astonishment on receiving intelligence of the meeting of Associates, which was rather mysteriously included in the programme of the Conference of Architects last week, and which resulted in a declaration of rights of so definite and uncompromising a kind as to be revolutionary. The assembly hall at Conduit Street was crowded with the young gentlemen; some of them, by the way, were not so young either; and, although we might truly report that the greatest enthusiasm was manifested throughout the proceedings, it is perhaps more in accordance with the fact to say that a spirit of quiet businesslike resolution prevailed, such as is always to be identified with the existence of what is called a good cause, and one that is likely to win. Perhaps it may have to be admitted that some of the speakers manifested a little inclination to exaggerate the facts; but this goes for nothing, for older and more experienced men exaggerate none the less; indeed, it is shrewdly suggested by observant persons that a certain amount of exaggeration is indispensable in these hasty times, if reformers would get a hearing at all. It is enough to understand, as everybody must now do very plainly, that there are grievances in this case which are of a perfectly practical character, and which those who suffer under them are disposed to insist upon being redressed. The only odd thing is the matter has been so strangely kept secret; for probably very few indeed of the Fellows of the Institute knew even that the Associates as a body were dissatisfied or displeased.

The gravamen of the complaint resolves itself after the usual British manner into the hardship of being denied the privilege of voting. It is not that the individual Briton in such cases is found always to vote with avidity in practice; on the contrary, he may vote so seldom as to make it almost never; sometimes, so far as he is personally concerned, he may have a positive dislike to voting, and may not care to conceal his sentiments; but, all this and a great deal more notwithstanding, the collective Briton, if you do not let him vote, must sooner or later know the reason why. So the junior class of the Institute members want to know why it is that they have not voting privileges of some kind or other; and, if they do not seem to care so very much what form these are to take, this is only the more significant, indicating, perhaps, the more strongly a general sense of discontent, based upon an arbitrary, unfair, and unnecessary exclusion from the usual rights of fraternity, which is sure to beget mischief.

As might be expected, when formulated for discussion, the demands of the Associates extend over wide ground. The Institute of Architects, it is declared, "should become more generally representative of the profession." This is a large question, and one that is exercising the minds at the present moment of many others besides the Associates, both inside and outside the Society. It is in fact a question, not so much of the capabilities of the members at the head of affairs, as of the very constitution of the corporation in view of the changed conditions of the profession itself. The advancement of architecture in a practical sense is a very different thing now from what it was fifty years ago when the Institute was founded; and it is not too much to say, therefore, that the whole of the machinery by means of which that object is to be accomplished may very likely be thought by many to stand in need of radical revision. At the same time all prudent and experienced men of affairs hold it for a maxim in such cases that reform ought not to go too far or too fast. The thoroughly English constitutional principle that an administrative system must "grow up," or, in the language of science, be evolved or developed out of the surrounding circumstances, cannot be too strongly insisted upon.

When the Associates of the Institute bring down their claims to the practical level of the assertion of a right to vote in the affairs of the Society, their leading argument is the very common one that, as contributors to the funds, they ought to have a voice in their disposal. The weight of this logic is vastly augmented when the fact is pointed out that the total amount which they contribute does not fall very far short of half the annual revenue. That is to say, the number of the Associates is so considerably in excess of that of the Fellows (691 as compared with 409) that, at half the rate of subscription per head, their importance financially is as here indicated; and it is scarcely to be wondered at, therefore, that when the warning call issues from the chair that "Fellows only are to vote"—in a question, perhaps, which Associates have been warmly debating—it should grate harshly upon the ears of the excluded.

We do not profess to say that, in such a case as this, the exclusion of a junior majority of the members of an open guild from a share in the administration of the business can possibly be long maintained; the genius of the age seems to be dogmatically against such a thing. Nevertheless we are quite prepared to find many of the best friends of the cause which the Institute represents, and especially those who are more advanced in years and experience, so strongly opposed to the recognition of the principle, that they will regard it as subversive to the utmost of both the dignity and the efficiency of the Society. But the view we prefer to take of the matter is one which, at any rate, seems to involve less argumentation. Here is a large section of the members who come forward and ask why they are ignored in those divisions which may be said to be in a certain sense the life of the Society—for, indeed, where there are no differences of opinion there is not likely, as it happens in this world, to be much vitality anywhere. This large section of the members are able to say that they constitute even a large majority, possibly two to one, or even more, amongst those who habitually attend the meetings. They are also able to point to large figures representing their aggregate money contribution. They are none the less able to say that every one of them is by his acknowledged qualification not only a man of full age, but a man of good education, and of high intelligence. The only difference, in short, between a Fellow and an Associate is that the Associate is not a fully-established public practitioner. Perhaps he has not been quite seven years in practice; perhaps he is an assistant; perhaps he only combines in his business measuring-surveying with architecture. He may be a young architect in practice, like the son and successor of the late Mr. STREET; or a very mature man of quantities, like the son of the almost equally famous Mr. RICKMAN; or the high-class middle-aged permanent manager of an office, who is biding his time, or is not necessarily anxious about getting into independent business at all. That so many classes of members so well qualified, therefore, to take an interest in affairs, should be now combining to demand a reason for their total exclusion from all that gives effect to such interest, is undeniably a serious incident, and one that cannot be treated lightly by responsible authority.

It remains to be seen whether the Committee of Associates appointed to take action in the matter will address themselves to the Council or to the members in general meeting. If they desire to be attended to without "the law's delay," especially in view of the proximity of the vacation, they will take steps to have a special general meeting convened speedily on the written requisition of eight Fellows. On the other hand, if they are willing to act in an accommodating spirit, they may submit their case to the Council—taking care to secure a friend or two at court—and wait, with the provincial members, for the result of the revision of the constitution which it is understood is to be promoted within the Council itself, in response to the expression of general uneasiness which has lately been manifested in so many quarters. We will only venture to say further that, now the question has been fairly raised, and the gravity of the arguments plainly stated, as was certainly done at the meeting last week, there might be more risk involved in hasty proceedings than in patient deliberation. The promoters of the movement may permit themselves fully to understand that their *pronunciamiento* has created quite as great a sensation as they could wish. They may also rest assured that the reactionary element introduced into the Institute a few years ago is not likely now to be an impediment in their way. The radical mistake of this is becoming more

and more clear. It has worked out its own downfall: the principle of *excluding* everybody from the work of the guild must give place to that of *including* everybody. Exclusiveness, we now know by experiment, means inanition and decay; inclusiveness promises vitality, vigour, and prosperity.

## ARCHITECTURE AT THE ROYAL ACADEMY.—II.

THE smallness of the space devoted to architecture at the Royal Academy is, let us hope, the reason why not a few of the drawings which are accepted have been hung so high that it is really impossible to do justice to them. Several of the contributions which have been in this way placed out of reach will be unavoidably passed over in this notice, which we propose to limit, moreover, to what may be called the architecture of the year, as distinguished from miscellaneous work. The first drawing which we shall notice is a sketch of a new block of *Buildings in Brook Street* (1206) by Mr. ROBERT W. EDIS. This is literally a sketch, but it represents a large amount of building, Elizabethan in character, and with a profusion of bay windows. Two designs by Mr. GEORGE W. WARD (1213, 1214) are shown in small drawings. The more important one represents a street front of very heavy round-arched architecture, but otherwise not unpleasing. In *Hill Lands* (1215) we have a design from the pen of Mr. W. H. A. BERRY, which begins a somewhat extensive series of half-timbered houses, of which some, like this example, are comparatively plain, others ambitious. To this series belongs Mr. A. R. STENNING's house at *Foxwold* (1217), a design to which the air of an overgrown farmhouse, rather than a gentleman's residence, seems to have been given by the exclusive employment of very rustic features.

Mr. ERNEST C. LEE exhibits a proposed new *Church for Collier Row* (1218), in a black, unprepossessing drawing, unworthy of the merits of the building. A staircase turret, apparently for access to the upper part of a rood screen, is a feature in this design. The drawing of the *Presbyterian Church at Stoke Newington* (1223), exhibited by Mr. SULMAN, errs as much in slightness as Mr. LEE's does in over-blackness. The buildings form a very good, well-treated group, though we question the advantage of a small tower and a large one to the same building, unless they be much more decidedly contrasted than in this design is the case. *St. Swithin's Church, Lincoln* (1224), by Mr. JAMES FOWLER, has a very lofty west tower and spire; otherwise it is not of exceptional character. In the *Edinburgh University Extension Buildings* (1236) Mr. R. R. ANDERSON has had a fine opportunity, of which he has probably availed himself to the utmost; but this comparatively inadequate drawing fails clearly to show as much. A large block of buildings with round-headed windows and a very large campanile is the subject of the drawing, which unfortunately is comparatively slight in execution and badly hung. *Pickhurst, Surrey* (1238), by Mr. J. M. BRYDON, is an ambitious pen-and-ink drawing, showing a very large house, of which some of the features are exaggerated and bizarre in design, as, for example, the singular roof to the central tower. Near this hangs a drawing of another large *House to be built at Wimbledon*, by Mr. E. C. H. BLAKE (1244). There is a singular absence of balance or composition in this design, taken as a whole, though the disconnected parts are some of them noteworthy.

Mr. J. J. STEVENSON exhibits the *Tower of Free St. Leonard's Church, Perth* (1245), a massive square tower, a good deal pierced by openings, and surmounted by a crown of four flying buttresses, like the well-known Edinburgh original. There is a dignity about this tower which is worthy of the architect's reputation. Near this hangs a contribution by Mr. A. W. BLOMFIELD, *The Interior of the Gallery, Denton Manor* (1247), a long and magnificent apartment, with the usual features of the Elizabethan gallery, such as an enriched ceiling, panelled walls, a lofty chimney-piece, and mullioned windows, all worked into a good and happily accidented composition. Of the same general character is the interior of the *Hall of Ingestre Hall* (1248), now being restored by Mr. BIRCH, who exhibits an exterior of the same building (1297). The ceiling of the old example is, however, really less artistic and rich than Mr. BLOMFIELD's, though, generally speaking, the old hall seems to be an excellent building; and, if it is to be touched at all, we are glad that the restoration should be in the hands of Mr. BIRCH rather than in those of

some one less well informed on the subject of old English domestic work.

Mr. T. E. COLLCUTT's *House at Sheen Common* (1249) is shown in a beautiful drawing. The design is full of breadth, repose, and vigour, and yet is refined. The buildings are half-timbered, and but one gable is introduced into the view.

Mr. WILLIAM YOUNG shows a proposed *New Façade and other Additions to Easton Lodge* (1251), in a not altogether happy drawing, where the front of the intended building looks the spectator full in the face. The style is Elizabethan, and the buildings are extensive. Above his drawing hangs a very dark one by PUGIN & PUGIN, representing additions to the *Old Palace, Mayfield* (1252). It is a pity that historical houses like this should be added to at all, but as far as we can decipher this drawing, the new work seems well designed, and quite in keeping with the old.

Mr. G. SHERRIN exhibits *A Row of Workmen's Cottages at Halstead* (1253), designed with some taste and care, and Mr. MAURICE B. ADAMS follows him with an extremely well-executed bird's-eye view of a country house near Lydney (1256). This drawing shows more of the roofs than of the features of the building, and yet a satisfactory effect is secured. Near this hangs a drawing of a church to be erected at Seascale (1259), by Mr. C. J. FERGUSON. This church is most suitable for the extremely picturesque locality where it is to stand. The principal features are simply a west tower, nave and aisles, and a low transept, but each is well designed; the grouping is studied and careful, and, in addition, the drawing is very well executed. *The Merridams* (1261), contributed by Mr. M. J. LANSDALL, is another of the half-timbered dwelling-houses exhibited, and is better than the average of them. Mr. JAMES BROOKS exhibits the *Church of St. Michael, Coppenhall, Crewe* (1263), in a design which is marked by most of the characteristics of his work. Lofty proportions, distinct and simple parts, and an air of dignity mark this church, which has a large transept and a small lantern at the crux, but, in addition, possesses a west tower, good in itself, but, in our judgment, not lofty enough for the church to which it belongs. The east end and the gable of the transept are both shown in this drawing, and are admirable compositions. A taking drawing illustrates an entrance porch and staircase at Campden Hill (1264), which Mr. E. H. BOURCHIER exhibits. These are evidently additions to a dwelling-house; the general idea is rather French, but the detail is Tudor, and perhaps too florid. The forms employed are unusual, and not all of them pleasing, but the management is clever, and the general effect is undeniably successful.

Another good drawing represents *Gilcruce* (1266), a fairly successful half-timbered house, of which Mr. J. F. DOYLE is the architect, which is followed by a subject of more importance, though less well shown—*The Church of Our Lady and St. Denis. St. Mary Church* (1268), exhibited by Messrs. HANSON & SONS. This is an interior view of a church of considerable size and richness, rather Belgian in character. Another church design is contributed by Mr. A. W. CROOK, in the shape of a well-drawn geometrical side elevation of the proposed *St. Philip's Church, Southport* (1270), of simple lancet architecture, well handled.

Mr. ERNEST GEORGE in *The Knoll, Barton* (1271) equals the execution of his Collingham Gardens drawing, which we mentioned in our first notice; the subject of this drawing is less extensive, but it is equally inspired with a perfect sympathy for ancient domestic architecture, and the same method of execution, in warm sepia, is employed.

*High Close, Hampstead* (1276), is another of the half-timbered designs for dwelling-houses which we have alluded to as numerous in this exhibition; and on the whole this example displays more composition and less trusting to chance combinations for effect, than the majority. After this come two or three unfortunately hung contributions, which we regret not to notice in detail; and we then reach a dashing drawing of *Residential Flats* (1281), exhibited by Messrs. ROMAINE-WALKER & TANNER. Neither the somewhat careless draughtsmanship, nor the very wide license in the use of debased Classic detail correspond well with the quality of the chancel of St. Saviour's Church, to which we drew attention in our last notice, and which bore the name of Mr. ROMAINE-WALKER alone. This drawing represents a large and showy block of domestic buildings, marked by combinations of features that are more startling than orthodox, and as to the success of

which, if the design be carried out, we cannot but entertain doubts. Much in the same *bizarre* architecture as the last are two small contributions by Mr. E. J. MAY, representing a group of stabling (1285), and part of a Bedford Park house (1284). These trifles are, however, undeniably picturesque and pleasing, and far more carefully designed than is usual with their author, who does not possess all the skill of Mr. ADAMS, whom we meet again with what he modestly terms a cottage at Windsor (1290), though it appears to be a good-sized, well-studied Queen Anne house, with a high-pitch main roof.

Mr. KEMPSON exhibits an exterior view of a good Early English church at Hereford (1294), with a tower a trifle less severe in treatment than the rest of the building. Another church, with a tower in effect detached, is the *Henry Wilson Memorial Church, Sheffield* (1300), exhibited by Mr. J. D. WEBSTER; this building is, however, of Perpendicular character. We return to domestic work with Mr. ASTON WEBB's richly-treated design for Bedford County Club, remarkable for the mass of windows occupying the front, which is followed by the commonplace, though ambitious, front of a house in South Audley Street (1298), shown in a large drawing by CRICKMAY & SON. Mr. F. H. OLDHAM sends a *Manchester Warehouse* (1301) of rather Gothic character, and Mr. ARTHUR CAWSTON a florid, but not very harmonious interior, showing the *salon* at Paddockhurst (1304), a kind of Elizabethan gallery, with some very doubtful details. Mr. A. R. STENNING follows with one of the best of the half-timbered series of houses built at Foxwold (1305). Even here, however, where much skill is shown, an oblique gable is introduced apparently out of pure wilfulness, and without any adequate reason or inducement. *Colwood, near Cuckfield* (1303), exhibited by Mr. H. RICARDO, is another large house of the same class, and more sober than most of those exhibited.

Mr. ROBSON sends a drawing of the interior of his *Prince's Hall, Piccadilly* (1309), but the drawing does not seem to us a successful one, and the Fates have not been propitious to it in the matter of position. Mr. SHERRIN's picturesque, well-balanced house at Ingatestone (1310), and Mr. E. C. LEE's simple and dignified *East End of St. Thomas's, Brentwood* (1312), bring us to Mr. R. R. ANDERSON's *Central Station Hotel, Glasgow* (1313), a rather inadequate representation of one of the best buildings of our days. The details of this building are Early French Renaissance, and the general grouping is simple and successful even as shown in this view; but the very fine lines employed do not possess sufficient force to bring out the effects of the composition properly.

*St. Cuthbert's Church, South Kensington* (1315), exhibited by Mr. H. R. GOUGH, bears a good deal of resemblance to a collegiate chapel. It has the singular peculiarity of an east-end occupied by a group of niches with sculpture, arranged with a general resemblance to the design of an east window, and taking the place of such a feature. Near this hangs a drawing showing very carefully the elaborate reredos full of sculpture of the chapel of Auckland Castle (1319), by Mr. T. D. FOWLER, and an extremely rough black drawing of a new Scandinavian church for Liverpool (1320), by Mr. W. D. CARÖE. This church has a central octagon, with a high pyramidal roof and short transepts, and other additions growing out of this centre. No contrast can be stronger than between the roughness of this last exhibit and the very delicate draughtsmanship and overwrought detail of a proposed moorside church (1321), by Mr. H. W. BOOTH. This elegant piece of detail would be quite out of place, we fear, on a moorside, and seems hardly sturdy enough to resist wind and weather, even in a more sheltered position. The restoration of the chancel screen, of late and rich woodwork, of Neen Savage Church (1323) is shown in a careful drawing by Mr. P. GORDON, and near it hangs a modest but very creditable sketch by Mr. T. WARD, of an *Artist's Cottage* (1328). The chief peculiarity in the design of this cottage is that the whole of the upper floor—there are three storeys—is occupied by a studio.

The drawing of *Fremington House, North Devon* (1330), by Mr. ERNEST NEWTON, is a good representation of a large house of late Queen Anne architecture, with, however, a certain infusion of dignity, which makes some amends for the partiality for debased forms shown by the designer. Messrs. HOOKER & HENNING send a drawing of the front of No. 142 Fleet Street (1332), as satisfactorily rebuilt by them; and Mr. E. S. PRIOR exhibits a large and rather pleasing house

called *Manor Lodge, Harrow* (1333). The view exhibited is apparently a garden front, and there are some complexities about the levels which interfere a little with what is otherwise a successful design. Mr. GEORGE SHERRIN exhibits two more domestic works, *Writtle Wick, near Chelmsford* (1337), and the *Gatehouse, Ingatestone* (1346), both successful, and showing good management of the parts of the design. These are half-timbered work, and may be said worthily to close the long series of such buildings we have noticed.

Messrs. HUNT, STEWARD, and F. C. KNIGHT illustrate, by a fine drawing, *Stuart House, Cadogan Square* (1343), a design which strikes us as the best of the Queen Anne buildings exhibited in this year's Academy. The building is rich, but the whole is in good keeping, and the plain work is made to throw up the ornament. We shall conclude this notice with Mr. G. GILBERT SCOTT's fine interior view and plan of the new *Roman Catholic Church of St. John Baptist, Norwich* (1340), in course of erection. This church approaches a cathedral in importance and scale. The arcade has above it a regular triforium, surmounted by a clerestory, and crowned by a richly-vaulted roof. A plan is appended which shows that the scheme is one of great extent and completeness. The work generally, whether we look at the dignity of the whole, the richness of the mouldings, or the skilful introduction of ornament, is most creditable, and the building must prove a remarkable addition to the fine series of Roman Catholic churches which have been erected in various parts of Great Britain.

#### EXHIBITION NOTES.—THE GROSVENOR GALLERY.

THE distinctive position of the Grosvenor Gallery as an exhibition of art upon which the doors of the Royal Academy were closed, or, to give honour where honour is due, as an exhibition where certain eminent painters delighted to place their pictures within more congenial surroundings than the motley multitude at Burlington House—this position, as distinctive and the prerogative of a novel enterprise, seems likely to fall before the more liberal government of the Academy exhibition. Eccentricity is no longer confined to Bond Street, impressionism and realism, and even mediæval revivalism, are to be found in Piccadilly; while, on the other hand, Royal Academicians seem to think it no bad plan to place on view within the Grosvenor Gallery the surplus products of their year's work, or such examples as might be held a little off the orthodox line. Nevertheless, there are still a certain class of pictures and certain artists that must be looked for in the Grosvenor Gallery only, and the exhibition of the present season owes its importance to such cause, for Mr. BURNE JONES shows here in *King Cophetua and the Beggar-maid* the noblest and most mature result of his imaginative and artistic faculties, while the portraiture of Mr. W. B. RICHMOND, the decorative composition of Mr. ALBERT MOORE, the clever eccentricity of Mr. WHISTLER, and the poetic if mannered work of Mr. STANHOPE and his pupils, present phases removed from conventional or academic styles.

It has never been our practice in these columns to worship Mr. BURNE JONES for his eccentricities, while we have been forward to acknowledge in his work the fervour of a rich imagination, high aspiration, distinguished power of design, and fine sense of colour. Eccentricity is often a cloak for ignorance or the contorted bias of uncontrolled individualism; it is in proportion as he has arisen above such weakness that Mr. BURNE JONES has been able to make full use of his rare gifts, and in the large picture now before us we are glad to welcome his art in its healthiest and most ordered, as well as most beautiful, manifestation. Upon a golden throne, built up with cunning invention in steps and panelled sides and pilasters decorated with arabesque and design, sits the "Beggar-maid," fair, tender, and meek, wonderment in her grey eyes and pale face, humility in her attitude, sitting forward on the seat with arms straight down supporting herself, and feet pressed close together; a scanty grey gown clings to her form, and shows its lovely and refined contours. The knightly lover-king has placed himself on a lower step, and, holding his crown in his hands, he looks up at his beggar bride, uncrowned, and worshipping before the worth of purity and beauty. Above the throne two attendant girls lean and sing from one scroll over the balustrade of a

gallery, which is draped with splendid stuffs that mingle with their rich raiment. The long staff and banner-folds of a gonfalon are set aslant against the side of the throne to the right, together with the shield of the king. This bare outline of the composition, which is on little short of life scale, can give small idea of the dignity and splendour of the picture. The dead golden hue of the throne, the pale flesh tones and soft iron-grey in the gown of the maid, bring contrast and force to the variety and richness of the king's dress, which has the dark and lustrous harmonies of a wild bird's plumage, and to the intermingled hues of the other draperies. The knight is undoubtedly the artist's finest study of a male figure; the dark-haired head seen in profile is a type of poetic and masculine beauty; the limbs are strong and largely knit, and have none of the emasculate languor or attenuated effort once too apparent in the painter's male models. The lines of the composition are most careful, the angles and levels of the golden throne giving substance, while the figures balance on the principle of the pyramid, kept from too obvious intent by the slant line of the gonfalon. If one must name a school to which this noble work belongs, it might be traced as akin to Venice and Ferrara; it may be allowable to think of GIORGIONE and CARPACCIO and of MARZIALE, or of the stately compositions of TURA and the GRANDI. The *technique* is beautiful, solid and fluent, cunning and curious in the fusing of pigments. Almost the only point which mars the completeness of the work is, to our thinking, the line of the right leg of the beggar-maid, which follows and is seen just beyond the slant fall of the drapery over her knees. It is a soft, over-soft, curve, wanting the emphasis, however tender, of well-proportioned and well-developed limbs. Against the drapery of the artist it has often been urged that it is not rightly understood according to accepted standards, and this must be granted. A certain fantastic inventiveness induces the painter to break up the folds in restless variety, or to cut up the surface into quaint devices, with a view to decorative and shifting colour, rather than to follow and indicate the underlying form. Such treatment when applied to Classical or sacred designs is certainly misapplied; in the present instance the manner is not pushed so far, and is better suited to the legendary and picturesque character of the theme.

MR. BURNE JONES exhibits another picture of a purely decorative kind. *The Dryad* is a square composition, in which a female form, draped in green, the spirit of the tree, is set at its heart, the foliage spreading all around and from her. In this instance the figure is treated as more distinct from the leafage and stem than in a previous panel, where the limbs of the dryad passed fantastically into grey ribands and leaf-like draperies.

MR. ALBERT MOORE's idea of decorative art is somewhat individual and limited. So many examples of it have in no previous season been fairly set before the public, for his work is to be found in the Royal Water-Colour Society's exhibition, in the Grosvenor Gallery, and on unusual scale on the line at the Academy. In all these instances he has occupied himself with the same problem, with variations; namely, the juxtaposition of figured grey or silvery stuffs patterned in shadow colour against delicate tints of pale vermillion. In the Grosvenor picture we have one figure wrapped in the diapered stuff, and the ruddy tone introduced as accident here and there; in the Academy design more than one figure is used, and the couch on which they recline is covered with silk gauze of faint vermillion, while the egg-shell grey and turquoise wall behind is diapered in wave lines of shadow tint. We use the word design, but the meaning, as ordinarily understood, must here be modified. MR. ALBERT MOORE does design, and that with laborious pains, but he designs more and more in colour not form; the languid and rounded forms of women he uses as dummies for draperies, the end of which is a scheme of colour and quality of surface, not a study of rhythmic and ordered line. Very subtle is his sense of harmony, very skilful his management of diaper, yet we do not wholly go with him. His result is spotty and fretful, although it must be allowed scintillating and brilliant also. It would be difficult to place in fitting framework these experimental schemes so as to form part of a decorative whole, and yet they hardly tell alone. On the whole, while frankly admiring, we incline to think that the painter's latest efforts, however patient and cunning, are not his happiest from the decorative side.

The chief contribution of EVELYN PICKERING, illustrating a verse from TIBULLUS, we have already noticed in studio

comments. It tells very well in the gallery, the sonorous quality of the colour standing the test. MR. STRUDWICK's art, though cast on the same lines of the early Tuscan school, is less sincere. We have an uneasy feeling that he does not, like the lady artist, *think through* the early school, so that habit has become nature, and realities take the aspect of the mind's conception; but that he consciously imitates the antique mode, and thus is like one who, with mincing gait, walks in a costume of bygone date. Yet there is beauty of fancy in *A Story Book* and in the parable of *The Ten Virgins*, and some figures are graceful, with distinct style and expression. The colour is harmonious if rather muddy, the manner hard and laborious.

MR. STANHOPE's design on the oft-quoted Shakesperian verse, *Patience on a Monument smiling at Grief*, has notable rhythm of line and pathos of significant expression and attitude, albeit marred by some mistakes of taste. The impersonation of Patience sits on a marble seat beneath overhanging greenery, leaning sideways on one arm, and at her feet another female kneels, in crouching attitude, and clasping her head with both hands, with action finely expressive of grief. The face of the love-sick maid, with simple parted hair and delicate English features, is lighted by a faint smile, the open mouth drawn with much sweetness and delicacy. The lines of both figures are in happy *rapport*; the draperies, in pale isolated tints, are in good harmony; only the clumsy thickness and awkward pose of the limbs of the chief figure, swathed over with pink drapery, strikes one, and there is an ugly intrusion of a piece of muslin under-dress, which for no visible artistic reason puffs out from the waist, and makes a meaningless break of line.

MR. WHISTLER is nothing if not unlike his neighbours, and the full-length portrait of *Lady Archibald Campbell* is novel, at any rate this side of the English Channel. The lady is in walking-dress, a retreating figure who looks back at you over her shoulder, the face, the one light in the scheme of dusky greys and browns, cast upon a background of gloom. The thing is clever and not unpleasing. Whether it is meant literally for a "nocturne" we do not profess to know, but surmise it to be only an ingenious "arrangement" in night colours.

The portraiture of MR. W. B. RICHMOND is again at its best for the qualities that have ever been its best attributes—style, distinction, a certain elevation and poetic perception of character, and artistic as opposed to literal treatment. The separate portraits of the sisters, *Miss Dora* and *Miss Rose Mirless*, *May*, the daughter of MR. G. W. RAWLINSON, *Miss Florence Rasch*, and the portraits of *The Hon. Ronald Leslie*, and of *Viscount Cranbourne* have all the characteristic mark. For charm probably *Miss Rose Mirless* and *May* bear the bell; the first, a half-length, in olive-green gown, saffron kerchief thrown loosely round chest and throat, and green hat shading a face of noble and sweet dark beauty, stands against a stretch of open down and a sky blue with fleeting clouds, that for the moment hide the sun, and emphasise the figure in luminous shadow against the background. There is something fearless and frank in the character of the lady's beauty, which is singularly in *rapport* with the treatment. In execution it is facile and broad, too unelaborated to suit the taste of captious critics may be. The same handling is used in the sweet profile portrait of *May*, clad in yellow buff gown, touching the keys of a pianoforte against a golden-brown background. The inexpressible charm of pure girlish beauty is in this innocent profile lifted in response to the music the fingers make. In *Viscount Cranbourne* the difficult scarlet of regimentals is bravely treated, and the face individualised in manly reticence. There is no doubt about the breeding of MR. RICHMOND's sitters; he is distinctively the painter of the refined and cultured class. Perhaps he learnt the secret partly from his master, MR. WATTS, R.A., who sends two portraits of *Lord Salisbury* and *Earl Lytton*, two fancy pictures in curious, iridescent colouring; also an upright study of a rain-cloud discharging a passing shower upon green, pastoral land. MR. ALMA TADEMA's two bust portraits of *Herr Lowenstam*, the engraver, and *Signor Amendola*, the sculptor, each occupied with his craft, are memorable for vivid actuality and character, and the clever realism of detail.

MR. MILLAIS, R.A., has finished the portrait of *Lady Campbell*, which on Show Sunday was only blocked out; that is to say, he has worked it up to a certain point of coherence, and diapered the golden background with gay flowers. But the flesh-painting is in crude condition; the throat especially

is disagreeably inchoate. A quaint little portrait-piece of three children by Mr. ROOKE, the *Sons of Major Godman*, deserves note for its Flemish multiplicity of detail and laborious painting in mosaic-like colour and solidity. The small portrait of the late *Dante Rossetti*, by Mr. HOLMAN HUNT, a reminiscence of the painter-poet in pre-Raphaelite days, must also claim a word.

If we close our notes of pictures here it is from no disrespect to the varied attractions of a list from which we have not enumerated a tenth part. Many of the exhibitors, academic or otherwise, we meet in better cue at Burlington House, and some we have noted on our studio round.

It remains to speak of the sculpture. And here we must pass over a quantity of more or less interesting work in the way of busts, portrait or fancy, including the terra-cotta *Mater Dolorosa* of EVELYN PICKERING, which we noted in her studio, and some reliefs, and turn to the only work of much importance, the *Dryope fascinated by Apollo in the form of a Serpent*, a bronze life-size figure by R. BARRET BROWNING. The story of the model who stood to the artist for this statue, with the pet serpent twined about her body, has been sufficiently ventilated in the press for a while past, together with the sudden and tragic death of the serpent, "much lamented." The only worth of such gossip is to substantiate what indeed the internal evidence supplies, that Mr. BROWNING worked from the life, and that literally. The model is strong-limbed and coarse in contours, without soft allurements or the noble charm of classic grace, and the sculptor has in naught extenuated. He has, moreover, left his modelling in a state of vigorous but rough unfinish. The attitude is hardly chosen with fine feeling either; the girl turns towards the serpent with the torso and head bent a little backward, and guards her left breast with both hands. Here adverse comment must end. Once a certain coarseness allowed, and one has only praise left for the power of the figure, the skill with which from all points it tells, though especially from the angles. The upward lift of the right arm and the backward thrust of the left are finely brought into line with the sway of the figure and the coiling curves of the serpent. The savage type of head, too, with overhanging mane of short hair, is in keeping with the general treatment. Altogether here is a work of undeniable, if disagreeable, strength. That it should have applied vainly for entrance at the Academy doors is hardly creditable to that establishment. Even a purist has no right to say the statue offends against the standard of decency, although he might wish that a more ideal aspiration might govern the talent of a sculptor of so much power.

#### NOTES FROM PARIS.

A SHORT time only has elapsed since there was a sale of the artistic property of the late Louis Leloir. The pictures were few, for the painter was esteemed, and his works were often purchased long before they had been completed. This week there has been a sale of the contents of another *atelier*, and one of a different class. Louis Leloir worked in a studio that was a most delightful little museum. Benjamin Ulmann cared little for accessories, and his big room in the Rue Chaptal was almost severe in its simplicity. Poor Ulmann was hardly appreciated as well as he deserved. The pupil of Drolling and Picot retained a great deal of the old academic style, and he was among those who believed that the system which was once represented by David should never be allowed to become obsolete. Everything he did was the result of laws which were inspired by the great masters. His *Séance du 16 Juin, 1877*, which is always surrounded by a crowd in the present Salon, represents the scene in the Assembly when all the members with one voice declared M. Thiers to be the liberator of France. The subject was difficult, for what is to be made out of some hundreds of men dressed alike in black, and sitting on rows of benches? Ulmann, however, has contrived to make a picture that France should retain among the national property, while it is so admirably composed as to become a work of art. The writer of these notes was consulted by the artist while the picture was in progress as to the advisability of exhibiting it in England. Ulmann thought that there was enough sympathy with France to make the picture attractive, and that strangers might be more eager to patronise him. How hard he worked for fame is evident by a glance at the works which have found their

way to the Hôtel Drouot. There we see his *Cato in the Senate*, which Ulmann was so glad to have reproduced in *The Architect*, his impressive *Marguerite en Prison*, and in a different style *Les Gitanos de l'Albaycin*, *La Crécelle de Nuremberg*, and *Education Alsacienne*—pictures which ought long ago to have found purchasers. Then there are reductions of his fine work in the Luxembourg, *Sylla chez Marius*, of the plafond in the Cour de Cassation, of the *Justice* in the Conseil d'Etat, and of works in provincial buildings. Here we have excellent landscapes, and there studies for illustrations of Shakespeare's plays—a sea-piece or a view of a temple. Ulmann was among the winners of the Grand Prix; and even amidst the sordid surroundings of an auction-room there is enough to testify to the merits of the system of education of which that prize is the symbol.

It is satisfactory to read in the proceedings of the Conference of Architects in London that tribute was paid to the splendid reproductions of the drawings and sketches of Viollet-le-Duc, which are being published by MM. Morel, although it would have been better if the description of the work came from an architect rather than from a surgeon. How is it that in France there is sufficient love for architecture to enable a book of that kind to be published, while it is impossible in England to obtain a collection of designs by Burges or Street, by Cockerell or Elmes? The French publishers are insured against loss in their venture; but if a man were to propose the production of the works of an English architect to one of the houses in Paternoster Row, he would be considered to be a lunatic. It is not in marble alone that the French have the memorials of their great men; if one can by any means be made the subject of a book, that book is forthcoming regardless of cost.

If, as Sterne says, they manage those things better in France, there are others in which more wisdom is shown in England. Paris has lately been in the throes of a municipal election, and happily the proceedings have been as dull as the elections of English poor-law guardians. The candidates have been allowed to cover the walls of public buildings with red, blue, and yellow placards containing their appeals to the patriotism of the *quartiers*. The effect was horrible, and, what is more, the colours have in some cases been absorbed by the white stone, and it will take many a heavy shower to remove the stains. There is, unhappily, a growing tendency in Paris to stick advertisements in positions where their appearance is almost a sacrilege. The State gets something by the stamp which has to be affixed on the smallest written advertisement for a lost poodle or for a charwoman, and there is a price paid for the wall-space. Even in the Place de la Concorde one sees hideous bills on the piers of public offices, and they have been allowed to degrade the façade of the Palais des Beaux-Arts. Fancy the effect of big posters on Burlington House! When the occasion passes those things are allowed to remain, and the architectural student who pays a visit in the autumn holiday to the grand old church of St.-Germain des Prés will probably find half the porch obscured by the announcement of some concert or other that was held last winter. To a Frenchman the bills may be trifles of no account, but Englishmen who have made Paris their home are generally more Parisian than the Parisians, and are jealous of anything which affects the amenity of the most beautiful of cities.

It is reported that the fountain in the Health Exhibition at South Kensington required the exercise of much patience and ingenuity before it was made fit to act and to co-operate with the electric light in forming a picture for the visitors at night. The water companies might supply unlimited water, but it was of little use so long as the fountain continued in its old condition. The authorities of the exhibition would have acted wisely if they had sent to Paris for an expert. The art of constructing fountains that will please the eye is unknown in England. What would have become of Paris during the late torrid weather if the fountains had been seized with the weakness which is so common in London, and had ceased to play? The cessation would be almost enough to cause a revolution. The English system seems to be to make holes and let the water do as it likes, while the Frenchman makes the water subservient to his will. It must form graceful lines and observe the law of contrast. Accordingly in one part it is allowed to flow copiously, and in another part to issue in a stream that

may be almost as thin as a thread. No one was ever known to admire the so-called fountains of Trafalgar Square, but the Paris fountains are always a picture. Every one is arranged to produce a different effect, and the two near the Palais de l'Industrie form a contrast. If they were in Hyde Park the arrangements would be identical.

There is some apprehension that the buildings of Mont St.-Michel are not yet safe from the influence of the sea. M. Antonin Proust, the president of the Commission of Historic Monuments, who has never considered his office to be a sinecure, is about to pay another visit to the Mont. As the buildings are of more than national interest, would it not be well—as well as complimentary—if a few English engineers and architects were asked to co-operate in forming a report?

A society has been lately formed which, although unofficial, is likely to do good service in supplementing the organisation of the Monuments Commission. It is called la Société des Amis des Monuments Parisiens. By a late resolution, it has been proposed that the members should endeavour to identify the work of Philibert Delorme which may remain in the Tuileries, and seek for some traces of the plan of the old church of St. Geneviève. Any English architects who may be students in Paris ought to join this society; the annual subscription is only 6 frs. M. Charles Normand, architect, 215 Boulevard Saint-Germain, is the honorary secretary.

A few years ago it was estimated that the Bibliothèque Nationale contained 8,000 volumes of engravings, and upwards of 1,300,000 plates. But according to a late return, there are now 14,500 volumes and 4,000 portfolios of engravings, in which are over two millions of plates. It is perhaps as difficult to count the prints as to count the rooms in the Vatican; and no one who has made use of the galleries in the Place Louvois can be surprised at any figures, however high, for the treasures are apparently inexhaustible. During generations they have been open to the world, while until almost recently the Print department of the British Museum was a comfortable seclusion for the keeper and his friends.

One is always sure to find a great many nationalities hospitably received in the Salon. Almost as remote from Paris life as the Cracow pageant is the scene in the Connemara cabin which a Mr. O'Kelly has painted. The picture has already appeared in the Royal Academy in London. The subject is the Celebration of Mass in a peasant's hut. There is a grave earnestness about the congregation, which reproves the frivolity of some of the pictures which are hung near in the Salon. The question must arise why a work which has sustained the ordeal of a jury in London and Paris has not found a purchaser? Mr. O'Kelly's work is admirable in every respect, but in Ireland an artist is expected to subsist without patronage. Here is a national subject, yet it is not appreciated. In a public gallery in Canada, the United States, or Australia, it would be a popular picture.

In the course of a week, or thereabouts, there will be a great deal of excitement among French artists, for the time will then have arrived for the determination of the pictures which are to be exalted by first, second, and third medals, and by honourable mentions. Probably there never was a year when the decision will be more difficult. Foreign works are excluded, but some of them, notably the colossal painting by M. Matejko, of Cracow, would otherwise be certain of recognition. The subject is Albert of Prussia swearing fidelity to Sigismund I. at Cracow in 1525, and the picture is remarkable for its vigorous painting, the figures being life-size, and the colour is Oriental in richness.

Although the Salon contains nearly 5,000 works, the space is insufficient for the works which have been produced. A rival gallery, on a temporary structure at the Tuileries, was inaugurated on Wednesday by President Grévy, and will be opened to the public on the 16th inst. The external appearance of the hall is not attractive, but there are many good works that can be seen within. The official recognition which the scheme has obtained has given rise to speculation, and there may be some ground for supposing that among the bureaucrats the independent position taken by the French artists in respect of triennial exhibitions has not met with approval.

The English church in the Rue d'Agnesseau is now in the hands of the builders, and the exterior will shortly be more worthy of an embassy chapel. The building, it will be remembered, is supposed to be Gothic in style; unfortunately it is of the carpenter's type. The new exterior has been differently treated, and, in spite of drawbacks of a narrow frontage and limited means, a satisfactory result has been produced. M. Richard is the general contractor, but as it was found difficult to obtain carvers who were adepts in the details of English Gothic, a few English workmen have been employed. The interior of the church is as chilling as the sternest Puritan could desire. An English church that will be equal to that of the Americans seems to be unattainable, yet no one seems to know why there should be a difficulty.

## ILLUSTRATIONS.

HOUSE FOR MR. ROBERT COURAGE, AT SNOWDENHAM, BRAMLEY SURREY.

THE house has a somewhat peculiar plan, necessitated by the fact that the site selected is the sharp slope of a hill. The extensive basement has been built of concrete of selenitic lime and stone dug on the spot, and broken with one of MARSDEN'S steam crackers. The concrete for the groining of the terrace is made with Portland cement. This part of the work has been executed by Mr. H. BROWN, builder, of Bramley. The upper portion of the house, which contains much oak-work, is being built by Mr. R. PINK, of Milford, the plumbing being done by Mr. G. JONES, of Godalming, and Mr. B. BOOTH being clerk of works. The architect is Mr. RALPH NEVILL, F.S.A., of High Street, Guildford, and 12 South Square, Gray's Inn, W.C.

HOUSE, PONNEREAU ROAD, IPSWICH.

NEW TOWER AND SPIRE, ETC., BALLYBRACK ROMAN CATHOLIC CHURCH.

THIS building stands on an elevated site overlooking the sea, situate a few miles south of Dublin. The new works include a tower and spire, baptistery, and staircase to gallery, and are indicated by a black tint on plan.

The height of the tower to the cornice is 76 feet, and of the spire, to the top of cross, is 142 feet. The building is in Dalkey granite, and is now nearly completed. The contractor is Mr. J. LONG, of Kingstown, co. Dublin, and the architect Mr. G. C. ASHLIN, A.R.H.A., Dublin.

INTARSIA DOOR, SALA DEGLI ANGELI, DUCAL PALACE, URBINO.

## ROCHE ABBEY, YORKSHIRE.

EXPLORATIONS are being carried on at Roche Abbey, one of the principal seats of antiquity in South Yorkshire, by Viscount Lumley, and some interesting discoveries have been made. The Abbey was a Cistercian monastery, and scarcely any trace of it now remains beyond portions of the church, principally of the east end, which occupied the north side of the quadrangle. The explorations were commenced about two months ago with a view of discovering traces of the tomb of Matilda of York, Countess of Cambridge, who was buried in one of the side chapels, and whose tomb was surmounted by an alabaster slab and an effigy; but so far efforts in this direction have been unsuccessful, and the attention of the workmen is now directed to other parts of the edifice. The foundations of the exterior of the chancel have been exposed, and it is in contemplation to uncover the whole of the church, which will be allowed to remain open afterwards for inspection. Although the tomb of the Countess of Cambridge has not been discovered, several highly interesting "finds" have been made. A large collection of fragments of the mullions and tracery of the east window has been discovered, and it is hoped that an effort will shortly be made to re-form the stonework of the window. Owing to the thoroughness with which those entrusted with the demolition of the Abbey carried out their task, it will be an exceedingly difficult operation. The workmen are now engaged in excavating from the middle of the nave towards the chancel, and against the base of one of the nave columns there has been found two figure heads, and on another stone were portions of the figure of an angel holding a shield. It has been said that there exists a subterranean passage leading from the Abbey under the stream which runs through the grounds in the direction of Laughton. This supposed passage is now thought to be nothing more than a drain, and all idea of exploring it has been given up. The recent discoveries include the finding of the well from which it is believed the ancient monks derived their principal water-supply.

## THE CONFERENCE OF ARCHITECTS.

THE proceedings were resumed on Friday morning, May 9, when the fifth meeting of the Conference was held. Mr. Arthur Cates, who presided, took the chair shortly after eleven o'clock.

The CHAIRMAN said that, though the attendance was rather thin, he would begin the business of the meeting at once, as the time at their disposal was limited. The room would no doubt fill up as they proceeded. In calling on Mr. Phené Spiers for his paper, he said he hoped it would give them the opportunity of originating some practical results which would bear fruit.

Mr. R. PHENÉ SPIERS, F.S.A., then read the following paper:—

On the French *Diplôme d'Architecte* and the German System of Architectural Education.

The communication which I have been asked to make on the French architectural diploma and on German architectural education is the outcome of a discussion which took place at the Royal Institute of British Architects on February 4 this year, after the reading of a paper by Mr. William H. White, the subject being "A Brief Review of the Education and Position of Architects in France since the year 1671." This paper, and the discussion which followed it, have been fully reported in the first half of the "Transactions" of the Institute for the present session, just published.

The latest regulations for the courses of study of the *Ecole des Beaux-Arts*, and the qualifications for the *Diplôme d'Architecte*, are fully set forth in the *Journal Officiel de la République Française* of October 10, 1883. I propose now to give a summary only of these, but would suggest that a translation in full ought to appear in the Institute "Transactions" for reference. I have further obtained information from various sources as to the working of the Diploma, and a list of the subjects for design given since its establishment in 1869. The summary I propose giving will be in some measure the complement of the remarks I made in the discussion following Mr. White's paper, when I confined myself chiefly to a description of an *atelier* and the working out of the designs therein under the advice of the Principal or *Patron*. As the *Diplôme* examinations can be passed only by those who have obtained certain *valeurs* or marks in the first class or upper division of the *Ecole des Beaux-Arts*, I am obliged to describe the curriculum of the obligatory courses of study there before specifying those referring to the *Diplôme* alone.

## Courses of Study.

The *Ecole des Beaux-Arts* affords gratuitous instruction to all comers, whether Frenchmen or belonging to other nations, between the ages of fifteen and thirty, on condition of their passing an examination. This examination takes place twice a year, in March and in July, and is divided into two sections; the first consisting of a drawing from the cast (either ornament or head of figure) made in the school in eight hours; of a model in clay of an ornament in bas-relief, also in eight hours; and of an architectural design to be executed from a programme given at the time in twelve hours. Those only who satisfy the examiners as to the first test can pass on to the second, which consists—1st, of a written examination in arithmetic, algebra (including quadratics and logarithms and geometry); 2nd, an oral examination in the same; 3rd, an examination in descriptive geometry; 4th, a written examination in history, followed by an oral examination in the same. Those who pass this second test become students of the second class of the school, and are placed according to the number of marks received in the examination.

The course of study in the second class consists of—(1) *Concours d'Architecture*, or competitions in architectural design; (2) *Concours* in construction, mathematics, &c.; (3) drawing from the ornamental cast, modelling from the cast (bas-relief only), and drawing from the antique figure. The first, or *Concours d'Architecture*, consists each year of the following courses:—(a) Six studies of the orders or portions of the same to a large scale, shaded in Indian ink. In explanation of these studies, I may note that it was found that many of the students entered the school with very little knowledge of the ancient styles of architecture, and very little power of drawing them. To remedy these defects, the new regulations require drawings of detail to a large scale, shaded in Indian ink, such drawings including studies of the orders, and of sundry details, as doorways, windows, cornices, &c. This obliges the student to be a good draughtsman, and to have some acquaintance with ancient architectural styles before he attempts to design. (b) Six complete designs (plans, elevations, and section), the original sketch being made in the school in twelve hours, and retained by the authorities. Before being allowed to compete in this course, at least two mentions must be obtained in the first course (analytical studies). (c) Six sketch designs finished in colours, and made in the school in twelve hours. (d) Two studies in ancient architectural styles, the programme for which is set by the Professor of History.

The second series of studies consists of—(a) A course of lectures in mathematics and mechanics, followed by an examination partly written and partly oral. (b) A course of lectures on descrip-

tive geometry. (c) A course of lectures on stereotomy, surveying, and levelling. (d) A course of lectures on perspective. These three courses are accompanied by the requirement to make a certain number of *épreuves* or drawings in the atelier, illustrating the course, and followed in each case by an *épreuve* or drawing made in the school *en loge* in twelve hours, and by an oral examination; and, lastly (e), a course of lectures in construction, followed (at intervals during the year) by studies in stone, wood, and iron construction, sketches for which are made in the school in twelve hours, followed by a complete set of drawings in each subject, done in the atelier in fourteen days, and one "*concours de construction générale*," in which the working drawings for a building are worked out with specification complete as if it were going to be constructed, three months being allowed to make the drawings in, the original design being made in the school in twelve hours. A *viva-voce* examination of every student is held in explanation of the drawings submitted in each of the above *concours*.

The third series of studies consists of drawings from the plaster-cast of ornament, modelling in bas-relief from the cast, and drawing of the antique figure. Twelve hours is given for the execution of any one drawing or model, done at the student's leisure, and not necessarily in one, two, or three sittings. At least two of each of these are required to obtain the medal or *mention* necessary for passing to the first class, and the Professor of Drawing decides when the drawings or models are good enough to be submitted to the jury.

The courses of study thus cited take about three years to go through; that is to say, that an average student giving all his time can obtain a sufficient number of marks or *valeurs* in three years to enter the upper school.

## Recompenses.

The *recompenses* given are:—For the *Concours d'Eléments Analytiques* (studies of the Orders), half-mentions. *Projets rendus* (finished drawings), whole and half-mentions. *Esquisses* (sketch designs), half-mentions. Mathematics, descriptive geometry, stereotomy, and perspective, third medals and mentions in each. For construction, first, second, and third medals and mentions. For drawing of ornament, antique-figure, for modelling, and for studies of history, third medals and mentions.

The values of these recompenses in second class are:—Half or second mentions, 1 *valeur*; 1st mention, 2 *valeurs*; 3rd medal, 3 *valeurs*; 2nd medal, 4 *valeurs*; 1st medal, 5 *valeurs*.

To enter the upper school it is necessary to have obtained six marks in architectural design, medals or mentions in mathematics, descriptive geometry, stereotomy, construction, and perspective; a medal or mention in drawing of ornament, modelling, and drawing of the figure. In the first class of the school in each year the courses of study consist of:—Six competitions in Architectural Design—finished drawings (*projets rendus*). Six competitions in Architectural Design—sketches design only (*esquisse-esquisse*). One competition of Composition in Ornament. (Done in the school in seven days.) Two competitions of Design in Architecture reproducing a style selected by the Professor. (The sketches for which are done in twelve hours *en loge* and the drawings made in ten days in the atelier.) Two competitions in Drawing from the Figure. (Twelve hours each.) Two competitions in Modelling of Ornament. (Two hours each.)

The recompenses are:—For architectural design, finished drawings—1st medals, 2nd medals, and 1st mentions. For architectural design, sketches—2nd medals and 2nd mentions. For ornament and design in selected styles—1st medals, 2nd medals, and 1st mentions. For drawing of figure and modelling—1st medals, 2nd medals, and 2nd mentions.

The values of these recompenses in the first class are different from those in the second, and are:—1st medal equals three *valeurs*, 2nd medal equals two *valeurs*, 1st mention equals one *valeur*, and 2nd mention equals a half *valeur*. Besides these are the *valeurs* accorded to those who take part in the great competition for the *Grand Prix* described in Mr. White's paper, viz., being among the ten selected, two *valeurs* or marks, and in addition the following:—First-second *Grand Prix*, four *valeurs* or marks; second-second *Grand Prix*, three *valeurs* or marks; mention, two *valeurs* or marks.

## Diploma.

After these preliminary explanations, I am able to come to the immediate purpose of my communication, viz., the examination required for the *Diplôme d'Architecte*. The first examination was held in 1862, when five candidates passed; but it was not until 1869 that the formal decree of the Government instituting it was passed. No examination was held in 1871 (the year of the war), or in 1873, 1874, and 1875—no candidates, I suppose, having presented themselves.

Up to the present time ninety-four candidates have obtained the Diploma, by far the greater number being in the last four years. The subjects given have been as follows:—

Programme of subjects of designs for candidates for the *Diplôme d'Architecte*, since its institution, of the *Ecole Nationale et Spéciale des Beaux-Arts*:—1869. A town mansion. 1870. An academy of music. 1872. *Salle des pas perdus*, or great hall of a palace of justice (law courts). 1876. A residence for three artists

—a painter, a sculptor, and an architect. 1877. A laboratory of natural history on the sea-coast. 1878. Four small residences for a tourist—one in Switzerland, one in England, one in Spain, and one in Italy. 1879. A carriage and foot-passenger passage through a palace. 1880. A hall for the public meetings of the Institut Nationale de France. 1881. A municipal library for a large provincial town of France. 1882. A house for the Société Centrale des Architectes, Paris. 1883. A concert hall for a large provincial town.

The examination is held once every year. No student can present himself as a candidate who has not obtained nine *valeurs*, or marks, in the first class of the school, either in architectural design, composition of ornament, or in the competition for ornament for the *Grand Prix*, and one mark in architectural history.

The subject for design consists of a building or portion of a building, worked out with plans, elevations, sections, working drawings, details full size, and specification complete, as if the building were to be carried out, with a *devis estimatif*, or schedule of quantities, of one trade. Six months are given to work it out, the original sketch being made in the school. On the submission of the designs the candidates are required to pass an oral examination before their drawings on the various details there shown, the theory and practice of their construction, the qualities and defects of the materials employed, their strength and stability; as also an oral examination on the history of architecture, on the elements of physics and chemistry applied to construction, on building legislation, and on the system of accounts.

The judges consist of the director of the school and the secretary (M. Albert Lenoir) of the school; three professors of the school *ateliers*; three professors of the external *ateliers*; the professors of Construction, of the History of Architecture, of the Theory of Architecture, of Physics and Chemistry, and of Building Legislation; two members of the School Council; an Inspecteur-Général of Historic Monuments; an Inspecteur-Général of Ecclesiastical Buildings (*édifices diocésains*); and an Inspecteur-Général of Public Works—the last three nominated by the Government; eighteen members in all.

I am inclined to believe that the standard required to obtain the *Diplôme d'Architecte* is much too high, and in this idea I am supported by one or two French architects whose opinions I have asked. It means six or seven years' serious study in Paris, and the provincial architect is not able always to afford so long a period; nor does his position or remuneration as *Architecte du Département* require a call for so searching an examination or multiplied preliminaries.

I have occupied so much of your time in my description of the French *Diplôme d'Architecte* that I must curtail the remainder of my communication to you respecting the German schools. So many years also have passed since I examined in detail the working of the schools of Berlin, Munich, Vienna, and Stuttgart, that I may not be giving you the latest developments. The papers of the examinations held in Berlin for the degrees of *Bauführer* (building inspector) and *Baumeister* (architect) are published in our "Transactions" of 1859-60, and will show you the very high standard (much too high, I think, in mathematics) required there. I will only, therefore, explain generally the system of education in the above capitals of Germany and Austria.

#### German and Austrian Systems.

In Germany, or rather in Prussia, the student comes from the university or school with a good knowledge of geometrical drawing, or drawing from the cast, and of mathematics and physics. He first enters the office of an architect for one year, where he picks up what he can, as in England. He does not pay anything, his knowledge of drawing and of descriptive geometry placing him in a position to be able to render assistance of value in return for the privilege of working there. He has then to pass a slight examination, and studies in the architectural school for two years. His attention there is turned to all the theoretical and practical points of the profession. He copies drawings made by well-known architects—if at Berlin, chiefly Schinkel's and Stüler's—and divides the time between making these copies and the composition of original designs (which are, of course, more or less adaptations of what he has learned in copying). He attends lectures on physics, mathematics, construction, ventilation and warming, sanitary science, and the principles and practice of estimating and writing specifications. At the end of the second year he passes an examination, and takes the title of *Bauführer*, or inspector. If he fails to pass he continues his studies. If he aims at a higher position he obtains an appointment on some Government building as an inspector or clerk (receiving a nominal salary) for three years, and then enters the school again in the first class to study for two years more, the studies being a very advanced kind. At the end of that time he passes an examination as *Baumeister* (literally "master of building"), and he then becomes a Government architect, or practises on his own account. At Munich and Stuttgart, the capitals of Bavaria and Wurtemberg, the practice still obtains, I believe, of studying one year in an architect's office before entering the architectural or polytechnic schools, as they are called. Two or three years are spent in the school, followed

by examinations. I am not aware whether the examination is recognised by the Governments of those countries.

In Germany generally architects and engineers study together in the same school; in France, architects, painters, and sculptors.

In Vienna architects have their special academy; there are Classic and Gothic professors, with their respective *ateliers* or studios; in many cases the student passes from one to the other. There are complete courses of lectures, competitions in design, and examinations held at the end of each term, as in an English university or school. In 1863, or thereabouts, a new system of study was introduced which is worth notice. The senior students of the school, about twenty in number, make an excursion with their professor twice or three times in the year for a period of a fortnight or three weeks. They take up one or two important buildings and measure them, taking plans, sections, elevations, and details (very similar to the work done in some of the series of excursions organised and carried out by the late Mr. Edmund Sharpe with the members of the Association). About 5% is allowed to each student by the Government, and his drawings become the property of the Academy. On returning to the school in Vienna, these drawings are worked out to a large scale, traced in lithographic ink, and reproduced, each student having a copy. Alternately with the making of these drawings they work out designs of their own, and naturally these designs are inspired with that feeling which they have imbibed when measuring and drawing the ancient edifices of the country.

So many years are spent in the German schools in training that comparatively few of the students make a Continental tour. In Vienna during one or two years after leaving the Academy, the Austrian student travels through North Italy; and when the Quadrilateral was in their possession special facilities were afforded for the careful delineation of the finest works of the Italian Gothic and Renaissance styles. The superiority of modern architecture in Vienna to that in Germany generally I attribute to these Continental studies.

Before quitting the subject of foreign education, it will be interesting to note that in Spain, throughout the length and breadth of the land, no one can practise as an architect who has not received the diploma of the Architectural School of Madrid. Except that the examination which follows after three or more years' studies in the school is preceded by a serious test in mathematics and physics, I am unable to give you further information.

#### System of English Architectural Training.

May I venture to trespass a few minutes more to draw a parallel between English and foreign architectural training? The first great failing in England is that the student coming straight from school is not yet prepared to make that use of the practical training to be had in the office which is universally assumed. He has little or no knowledge of freehand or geometrical drawing, of physics, mechanics, or of any of the elements of architectural style; he flounders about, therefore, in the sometimes styleless design of the architect in whose office he may be placed, and acquires by the longest possible process a certain knowledge of a mixture of style and no style, second-hand: his powers of reasoning in design, as a rule, are not brought into play until his articles are terminated, and then want of time and absolute lack of training at once curtail his ideas and cramp his imagination. He has picked up an idea here and there in the office, and numerous details, but he finds himself unable to grasp the composition of a building of any size. In many cases he has never had an opportunity of visiting or studying any one of the buildings the drawings of which he has been continually at work on; and, therefore, supposing he has been thinking for himself, has never seen the results of his thoughts and inquiries (this observation applies more to London than to provincial students). He has, in fact, taken from three to five years to learn imperfectly what might have been learned in one or two if his mind had been previously properly trained to receive it.

#### French System.

If we turn now to France we find that foundation of knowledge laid which is wanting in England. Before the student enters any office, his hand is trained to draw freehand in the primary schools, and his mind developed with a knowledge of applied mathematics and descriptive geometry. He enters an *atelier*, and the elements of style are learned in the Ecole des Beaux-Arts. Architectural drawing is carried to a high standard. Original designs are worked out, interspersed with instruction in construction of various kinds, and all the sciences cognate to architecture. The student works not so much in rivalry with his fellows as in *atelier* against *atelier*. This rivalry of the studios, which I described in the discussion following Mr. White's paper, is the most important feature in French architectural education. The isolated effort of one individual in rivalry with another may—nay, must—continually fail, because the development of style is not, and never can be, worked out entirely by one man. An original genius suggests a theory, a second carries it a little further, by numerous others it is taken up, till at last this new idea becomes an established fact. A number of men working in one *atelier* form a school in friendly rivalry against others. Each student in it exerts himself to his utmost.

The senior students advise the juniors in the study of their designs. The junior students in return work for the senior students, and acquire knowledge of style by so doing. The energies of both are brought into play, and this unison of feeling, this mutual co-operation, enables the student to acquire great knowledge of style, rapidity of execution, and a serious study of design in a short time. In this we find the secret of the success of the French school, so far as it goes. Where, then, does it fail? It fails because a studio or *atelier* is not an office where work to be executed is drawn out, or a *chantier* where it is being carried out. Those students whose means necessitate their working for their living whilst their studies are continued from time to time at the school, do acquire that practical training which fits them for their vocation, and the most prosperous architects in the present day in France (and by prosperous I mean not those highest in rank, but who are the most sought after by clients), are not, as a rule, the past Grand Prix men, but those who commenced their practical training at an earlier period of their existence. On the other hand, it must not be forgotten that the high standard of design which exists in France is due to those architects who, in one sense, have sacrificed themselves and their prosperity (so far as a large income is concerned) by continuing their studies till they had obtained the Grand Prix, and then devoting four years more to research and study in Italy and Greece. The important changes which have in late years been effected in the Ecole des Beaux-Arts show that the Government is fully alive to the defects in its system of education, and the practical character given to the *Diplôme d'Architecte* may bring about an important change in the architecture of French buildings.

#### German System.

In Berlin this want of practical training is avoided by the student being obliged to study for one year in an architect's office before entering the school, and (if he aspires to the rank of *Bau-meister*) by the spending of three years as inspector or clerk on Government buildings before he passes to his second and superior training in the school. Compared, however, with French education, the German fails in art because he is linked with the engineer instead of with the painter or sculptor, and, further, by working in one *atelier* (viz. the school) and under one set of professors, the rivalry lies between student and student, and not between *atelier* and *atelier*. Add to this that the custom (whether it continues or not I do not know) of copying eternally the designs of Schinkel, his ceilings, staircases, cornices, &c., cramps the German architectural mind, and prevents its emancipation into a freer line of thought and imagination.

#### Educational Progress in England.

Of late years in England an immense progress has been made due chiefly to two causes:—1st. The great development of the practice of drawing and measuring ancient buildings encouraged by the rewards of the Institute, of the Architectural Association, and of the Royal Academy, and the subsequent publication of such drawings in the Architectural Association Sketch Book and other publications, and in the professional journals; and, 2nd, the extraordinary enterprise shown in the publication of drawings of actual modern buildings and of competition designs in the professional journals of the day. Where all of them have been doing their best to supply a demand, it would be invidious to name specially any one of them, but there can be no doubt that the immense development and freedom of architectural design during the last ten years in England, and the rapid advance in draughtsmanship, is more or less due to the placing within the means of the poorest student a series of illustrations of the latest developments of architectural style. Two other educational sources must here be noted:—1st. The meetings and classes of the Architectural Association, a society unique in its character, existing in no other country and in no other profession; and, 2ndly, the Royal Academy, which, for obvious reasons, I should have refrained from mentioning, were it not to pay tribute to the services of those members of the Academy who, in late years as visitors, have given the students the advantage of their experience and of those other qualifications which have brought them among the elect. And here I venture to take this opportunity of rendering a personal tribute to the memory of one of our greatest artists whose loss we still deplore, the late Mr. George Edmund Street. The long experience I have had of architectural training enables me to judge, perhaps better than anyone else, of the extraordinary value of the services which Mr. Street rendered in the Architectural School of the Royal Academy. The rapidity and range of his grasp of such subjects of design as were being worked out by the students, the wonderful fertility and originality of his mind, and the peculiarly happy way in which he (accepting the scheme of the student's work) turned it from bad into good architecture, and in a few minutes gave him the benefit of forty years' experience, promised to lay the foundation of a school of architectural designers in this country which would have left its mark in the architecture of this last quarter of the nineteenth century. His career as visitor in the Architectural School was, alas! too short, but the influence of his work remains with us; and among those

who, in addition to his advice in the Academy, received their architectural training in his office, there are some who have already taken a foremost place in the profession, and others who are, I trust, destined to do so.

#### Discussion.

The CHAIRMAN, in opening a discussion, said that Mr. Spiers's paper, which one and all must have listened to with the greatest pleasure, treated of a subject the importance of which it was hardly possible to over-estimate, as the future of the profession and the honour of our country in the art depended upon the education of the students of architecture. Young men upon whom that future depended were under the charge of leading members of the profession, who received premiums for allowing them what was often only the run of the office. Mr. Phené Spiers, who was really the representative of architectural education in this country, had devoted a great deal of time that he might bring before them in a summarised form his knowledge and experience of the French and German systems of architectural education, and it showed a rather disheartening difference between the advantages open to the student abroad over the English student. It was, then, to be regretted that the leading members of the profession should, in the interest of the knowledge they were distinguished by now, and would be distinguished for in the future, on the present occasion be distinguished by their absence from the meeting. It would have been more gratifying if they had set aside present engagements in order to favour the profession at large with their sentiments on the position and prospects of the profession now and in the future. The Chairman said he could not speak from his own knowledge of the Royal Academy school; but, all the same, he could, from a knowledge of his own pupils, testify to its excellence. He endorsed Mr. Spiers's remarks on the late Mr. Street, who, when they lost him, was developing a system of architectural education at the Royal Academy school, which brought out the capabilities of students in a way which in England he believed had never been done before. All honour, he said, to Mr. Street for it, and he hoped the Royal Academy would continue to give all possible help to Mr. Spiers in that which, after all, was but a feeble effort in comparison with what was done abroad. The Chairman then noticed the striking character of the drawings exhibited, and referred particularly to those of Mr. Burnett (son of Mr. Burnett of Glasgow) as an instance of natural abilities developed at an early age, and great advantages gained by following a course of studies such as Mr. Spiers had indicated. The Chairman then noticed an unsatisfactory feature in regard to English students, from the want of any particular guidance in an architect's office, or only such limited guidance as was got in competing for the prizes offered annually by the Institute, &c., limited because it was of advantage only to those who would, prizes or no prizes, make their mark in life.

Mr. LAWRENCE HARVEY said he had had experience of the German system of education, having passed through a course under Professor Semper, at Zurich. The fault of the German system seemed to be that in routine matters it was far too school-boyish, and this was the Professor's opinion also, though it did not come within his power to alter the course of studies as fixed. In Paris matters were different. There was greater freedom, less control, and studies were not conducted on the school-boy principle, and consequently studies were pursued with greater zest, and times and hours given up to learning that would not be expected from a school-boy. He belonged to the *atelier* of M. Hippolyte le Bas, having Garnier and Lefuel for fellow pupils. Indeed, most of the distinguished French architects had been pupils of M. le Bas. Mr. Harvey pointed out that scale of fees paid by pupils diminished as the student acquired proficiency. On taking a medal the patron would ask for no fees at all. What motive had the French architect in opening an *atelier* for pupils without fees? Partly, no doubt, because of the *pour le gloire* sentiment which pervaded their character, and secondly, because to become known as a good teacher was one of the best stepping-stones to the highest honours that France could give. Now he had a scheme to propose which he thought would offer a motive to English architects to try and turn out pupils, masters in their art, without costing a penny. In the Institute they awarded prizes, had an examination for associate-ship, &c. When they proclaimed the name of a pupil who had taken prizes or honours, they should proclaim the name of his master, for a great part of the merit of the pupil depended on the master. If this practice were adopted a change would, he believed, soon be wrought, and, just as was the case in France, some masters' names would become known as being particularly good masters. M. le Bas had not carried out any great work—such, for instance, as the Grand Opéra at Paris—but he had made his name by being a master. Some men had a particular aptitude for being masters, and this was their only means of bringing themselves into notice. They had not the influence to secure a work of any magnitude to bring their name into notice. When architects designed and carried out a great work all the world knew of it, and talked of them. Honours were given to them, gold medals awarded them, or honours of knighthood, &c. All this was rather foolish in one point of view. To call Wren, Sir
